1. A brake of the type set forth, comprising a rock shaft having cranks at its ends, brake shoes pivoted to said cranks, a transverse member formed with openings, said brake shoes having stems projecting through said openings as guides, pins carried by the stems above the transverse member, spring actuated means for rocking said shaft, and means for holding said shaft normally against movement by said spring actuated means.

897,450. Short Turn Gear. Robert H. Bowman, Canon City, Colo. Filed Feb. 24, 1908. Serial No. 417,380.

1. In a short turn gear, the combination with the main frame of the vehicle, a pair of driven gears mounted thereon, and the front truck wheels loosely mounted on their respective axles; of a separate gear connection that joins each of the wheels with their respective drive gears, each of the said connections including a shifting clutch device, for throwing the wheels out of gear with their respective drive gears, means on the front truck frame for oscillating the wheels together but in reverse directions and other means on the said front truck frame for independently actuating the clutch devices.

897,466. Spark Plug Guard. Robert S. Kearney, New York, N. Y. Filed April 9, 1907. Serial No. 367,146.

1. A guard for spark plugs comprising a cylindrical shell open at both ends and adapted to slip over the spark plug and inclose the same, one end of the shell being secured to the base of the spark plug while the opposite end is provided with a notch, a removable cap normally closing the notched end of the shell, and a hood carried by the cap and projecting over the said notch.

897,472. Jar for Storage Batteries. Joseph Marx, Buffalo, N. Y. Filed July 19, 1907. Serial No. 384,580.

In a jar for storage batteries, the combination of an outer shell, an inner shell formed of hard rubber and fitting within the outer shell, the said inner shell being provided at its mouth with an enlarged annular rim also formed of hard rubber and extending over and resting upon the edge of the outer shell, and a lip of soft rubber pendent from the enlarged rim and overlapping the edge of the outer shell upon the exterior thereof.

897,519. Rotary Engine. Levi Bonner, Ames, Colo. Filed Sept. 20, 1905, Serial No. 279,257. Renewed Jan. 25, 1908. Serial No. 412,634.

1. A rotary engine having outer and inner cylinders, one of which has a movement of rotation relative to the other, a resilient blade attached to one of said cylinders whose edge bears on the circumferential surface of the other cylinder, and fluid pressure inlets and outlets opening into the space between the said cylinders, said blade

Digitized by Google

being rearwardly inclined and the faces thereof against which the pressure acts being inclined to the face of the cylinder against which it contacts, substantially as described.

897,532. Cooling Device for Explosive Engines. Reinhold Herman, Crafton, Pa. Filed Aug. 12, 1907. Serial No. 388,157.

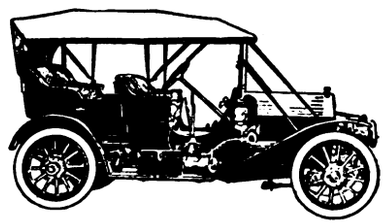
1. A cooling device for the purpose set forth comprising groups of sets of combined water and air conduits, the water conduits of each set of each group being suitably spaced apart and the air conduits being open at each end and disposed within the water conduits, each of said air conduits opening at each end directly into the atmosphere whereby the air will be conducted by the sets of air conduits of each group in the same general direction and in currents independent of each other, the combined conduits of each group extending in an opposite direction with respect to the conduits of the other group.

897,591. Automobile Running Gear. John W. Cooper, Boston, Mass. Filed July 2, 1907. Serial No. 381,819.

1. In a vehicle running gear, the combination of upper and lower frames, an intermediate frame between said upper and lower frames and having pivotal connection with the former, a vertical spring arranged between the inner portion of said intermediate frame and the lower frame, a horizontal spring mounted upon the lower frame and connecting means between said horizontal spring and the outer portion of the intermediate frame for supporting the latter by a suspending action.

897,630. Detachable Rim. Rudolf Kronenberg, Ohligs, Germany. Filed Dec. 21, 1907. Serial No. 407,462.

1. A rim for vehicle wheels, bearings engaging the spokes of the wheels and provided with openings, and a transverse locking member engaging said openings and provided with an eccentric part engaging the rim.



897,663. Convertible Automobile Body. Edward T. Robinson, St. Louis, Mo., assignor to St. Louis Car Company, St. Louis, Mo., a Corporation. Filed Sept. 27, 1907. Serial No. 394,823.

1. A convertible automobile body consisting of a body proper, stationary corner posts extending upwardly therefrom, a top supported by said corner posts, side posts, hinged to said top and susceptible of being moved in juxtaposition to the top of the vehicle body, means for retaining said hinged posts in either their elevated or lowered position, and window sashes for co-operating with said stationary corner posts and said hinged posts, substantially as set forth.

PENNSYLVANIA

1909

Meeting the demand for a small and light car the type "D" "25" has been produced. In every detail but size and horsepower the new type "D" "25" will equal the great Pennsylvania "50."

1909 Type "D" "25" (A. L. A. M. rating 29)
Roadster, $2,000
Baby Tonneau or Touring Car, $2,100

The famous Pennsylvania type "C" "50" remains unchanged, now and forever, price $3,000. All models equipped with magneto and gas tank.

NEW SERIES TIMKEN SHORT BEARINGS

Cone

Roller

One Piece Cage Ring

Cone with Roller and Cage Assembled

In offering the Automobile trade our **New Series Timken Short Bearings,** we do so with the assurance that they are made from the same carefully selected steel and subjected to the same severe tests as our standard size Bearings.

The **New Series Short Bearings** are designed for use in axles where the bearings space does not permit the use of our regular series.

These Short Bearings can be used in any axles where Annular Bearings can be used. They carry **a much greater load** than Annular Bearings of the same length, **are smaller in diameter** and in addition will take as much **end thrust** as they do **radial load.**

Every bar of steel entering into Timken Products is made to the Timken analysis chemically—and tested to the Timken test physically—which means a rejection of **45 per cent.** of every ingot before metal of suitable density and soundness for Timken Roller Bearings can be obtained. These new Short Bearing Rollers are made from best nickel steel.

This is one reason why **65 per cent.** of the makers of high-grade Automobiles and over **90 per cent.** of the commercial truck builders of this country use Timken Roller Bearings.

Anybody Can Understand a Remy Magneto

An It Will Stand More Abuse Than Any Other Ignition System in The World

Here is the simplest ignition ever devised for a motor car.

The Remy Magneto is so easy to understand that anybody can install it whether he ever had anything to do with machinery or not.

Terminals for connection of the wires are indicated with red, green, and yellow, corresponding to the colors of the wire covers. You put the red on the red, the green on the green, and the yellow on the yellow. The diagram that goes with the Remy is just like A, B, C.

Even if an improper connection should be made, it wouldn't injure the magneto. The Remy is the only magneto of which this is true. It is "fool proof."

And the Remy will stand more neglect or abuse from oil, dirt and water than any other ignition system in the world.

Every experienced motorist knows how important this is. Uncertain firing is one of the most serious troubles with which he has to contend.

In this respect the Remy differs materially from the usual delicate, sensitively adjusted apparatus that so easily gets out of order.

THE REMY IS THE STANDARD MAGNETO OF AMERICA

It has been used as standard equipment upon leading automobiles since the very beginning of automobile manufacture.

Despite the fact that every year from six to a dozen new magnetos are placed on the market.

The Remy is the only American magneto that has ever been used by American automobile manufacturers, except in an experimental way. The combined sale of all the imported magnetos, and the several new American magnetos, will not equal the total sale to date of Remy Magnetos for 1909 American cars.

There must be reasons for this almost unanimous agreement of the superiority of the Remy. You certainly take no chances in accepting the verdict of the big majority. Examine the Remy. See for yourself why it is the simplest and most reliable magneto yet produced.

Notice that it has no brushes to cause trouble—wear out or be replaced.

This is only one result of our long experience in magneto making. We are the oldest magneto manufacturers in America and the oldest manufacturers of high tension magnetos now used almost exclusively in the world.

Magneto ignition is now almost universally demanded by motorists. Every high grade car uses it, or makes it an attractive option.

Buick Cars, equipped with Remy Magnetos, captured eleven out of fourteen events at Montreal, beating Christy and Barney Oldfield's machine and tieing for the fastest half mile.

Don't try experiments. Settle the ignition question once for all with the Remy.

Write us for illustrated folder giving full description of the Remy. Address Dept. 11.

REMY ELECTRIC COMPANY, Anderson, Ind.

We have opened a Branch Office in Thoroughfare Bldg., Broadway and 57th St., New York. The Remy Magneto will be exhibited at all the Automobile Shows.

MILLER'S Anti-Freeze Compound

DIRECTIONS FOR USE.

The radiator should be thoroughly washed out with hot solution of caustic soda, which will remove any dirt, and then clean water should be put in to see if the radiator leaks any place.

If the radiator is found not to leak, put in the solution. To get a mixture that will not freeze at 15 degrees below zero, Fahrenheit, add ten pounds of the compound to two gallons of water. To get a solution that will not freeze 30 degrees below zero, Fahrenheit, add ten pounds of the compound to every six quarts of water.

The cover on the can should be kept closed tight at all times while it contains any of the compound.

Price, 10-lb. cans..... $1.00 each.

Pan-American Automobile Body Polish

Pan-American Polish was awarded the Bronze Medal ("the only one awarded") at the Louisiana Purchase Exposition at St. Louis, 1904. This polish has been carefully prepared for the Automobile trade. It is also applicable to the carriage trade, or can be used on any varnished furniture or wood-work of any kind. It will remove stains, cover scratches; leaves the automobile with its original new lustre without being sticky or greasy.

It can be used on the leather seats or tops with the very best results. Can be used on any color or kind of varnish from the clearest white to the darkest black. Furnished in eight-ounce bottles.

For sale by all automobile dealers.

Price, 60 cents per 8-oz. bottle. Price, $3.00 per gallon.

Special prices quoted manufacturers, jobbers and dealers. Catalog on request.

FRANKLIN AUTOMOBILES

Model D, five-passenger touring car. Full elliptic springs.
Built-up wood frame. 36-inch wheels. 106-inch wheel base.
2200 pounds. $2800, f.o.b., Syracuse. Top extra.

A high-grade powerful automobile. Refined, reliable and safe. Abler for touring on American roads than any automobile but a Franklin. Beautiful to look at, comfortable to ride in and doing its work at the lowest operating cost.

The biggest mistake in automobile making is useless weight and bulk.

Great weight is not needed to carry passengers in an automobile. It is not necessary for strength either. Useless weight is a weakness. It handicaps the power and discounts the ability. It is expensive beyond all reason.

The average water-cooled automobile weighs 25 per cent. more than a Franklin of the same capacity. In many cases the difference is even greater. Figure out what this means in wear and tear on tires, and on the patience and the nerves. Figure the difference in fuel needed to move the same passengers.

Beside this the Franklin air-cooled engine produces the same power as a water-cooled engine on 25 per cent. less gasoline. Franklins make no repair expense for a leaky or frozen plumbing system. They work all the year. They are easier to handle than a heavy automobile, less liable to accident and damage. Their depreciation is less.

A water-cooled automobile can't be as light as it ought to be without sacrificing strength or comfort or some other important quality.

The first and last question to ask about an automobile before you buy it is, "What does it weigh?"

"My Model D goes over many of the roughest and hilliest roads in Rhode Island and Massachusetts in company with other cars of greater power than mine, and I always find myself at the right place at the finish. If I had four times as much money to put in a car I should still want a Franklin. I find it durable, comfortable, strong and light, a fuel-saver, a car that moves all the time whether up hill or down. I am satisfied that I have a corking good car and do not want any other unless the H. H. Franklin Mfg. Co. can in some way improve upon their own product."

SIDNEY WILLIAMS, 23 Broad St., Providence, R. I.

May 4, 1908.

THE MARMON

"A Mechanical Masterpiece"

Marmon "Thirty-Two"
$2400

For The Man Who Doesn't Buy With His Eyes Shut

The Marmon "Thirty-two" is neither a cheaply-built car at a low price, nor a "good-enough" car at a high price.

It is a thoroughly high-grade car, carefully built and completely equipped, at a price which makes it the best real bargain of the year.

It is a car of whose character, appearance, and performance its owner may well be proud. It is a car that will live and can be depended upon. The Marmons of 1904 are still giving splendid service.

Equipment and Marmon construction considered, it urges a careful investigation by every buyer who is really economical.

Genuine Krupp and Chrome Nickel steels used in important parts. Bosch magneto and battery—dual system. Hess-Bright imported ball bearings. Weight (weigh it), 2,000 lbs. 32-40 H.P. Big tires (34x40 all around). Large brakes. Straight line shaft drive. Fully equipped. Touring car, Roadster, Four-Passenger Suburban with removable rear seat, or Limousine Town Car.

TO DEALERS: This car is a winner Your competitors will have to take off their hats to it.

The superb Marmon "Fifty" (with Seven-Passenger or Four-Passenger Body) $3,750

THE
American Standard Car

is a title deserved in so great a degree by no other car than

"The Maxwell"

The Maxwell serves the needs of a greater variety of users. It gives unqualified satisfaction to the man to whom economy of upkeep is a consideration as well as to him who in using a Maxwell finds excessive first outlay unnecessary.

Whether the motorist travels about in the Maxwell Junior $500 Standard American Runabout; whether he uses the 2-cylinder 14 HP. Runabout, which is sold, fully equipped, at $825; the 2-cylinder 20 HP "Doctor" Maxwell—the ideal physician's car, at $1,350, fully equipped; the 2-cylinder 20 HP. five-passenger Touring Car, at $1,450, fully equipped; or one of our 4-cylinder 30 HP. cars of the five-bearing crankshaft type selling at $1,750—every one of these models represents the highest value ever produced by the American automobile industry.

Maxwell Model D A, 4-cylinder, 30 HP. Touring Car, $1,750.

Some cars use THREE-POINT SUSPENSION; others THERMO SYPHON COOLING, UNIT CONSTRUCTION, MULTIPLE-DISC CLUTCHES—but no other American car combines all these important features in a single design, except THE MAXWELL.

Our 4-cylinder 30 HP. types use five-bearing crankshafts—a construction more expensive to make, but certain to produce the satisfaction that is genuine Maxwell satisfaction, the pleasant certainty that the problem of owning a Maxwell is PERFECTLY SIMPLE, because the car itself—no matter which of the Maxwell models you choose—is SIMPLY PERFECT.

You should be interested to learn more about Maxwells. Drop us a line.

The Jackson "Mud-Hen"

from Detroit, Mich., to Bangor, Maine flies through on time

Because of the Wonderful Accuracy of the Warner

AUTO-METER

This wonderful instrument is so sensitive that it correctly indicates the speed when the car is PUSHED AHEAD BY HAND.

No other speed indicator begins to indicate until the car has reached a speed of 5 to 15 miles per hour.

The Auto-Meter is so accurate and durable, that instruments FIVE YEARS OLD still test absolutely accurate within 10 FEET TO THE MILE.

Those who demand ENDURING ACCURACY insist on the Auto-Meter. It is the only instrument SUPPOSED to indicate speed which REALLY DOES IT.

What Could Be More Convincing Than This?

Mr. Inderrieden, Borough of Manhattan, Nov. 10th, 1908
Warner Instrument Co.,
New York City.

Dear Sir:

It gives me great pleasure to inform you that I used the Warner Auto-Meter upon the Model "H" 1909, $1600 Jackson car, with which Mr. E. P. Blake of Boston and myself made a non-stop run from Jackson, Mich., to Bangor, Me., in 215 hours continuous driving. The car ran continuously during the seven days of the run. The roads were something frightful, and it took a great deal of night driving to keep up with our schedule.

We found the Auto-Meter absolutely indispensable to us in picking out the road, and as sign boards and other indications were rather vague, we had to depend upon our guide books and maps and then watch the Auto-Meter.

The Auto-Meter never failed us, and I take this opportunity of expressing to you my entire satisfaction at the manner in which it performed.

Very truly yours,
CHAS. G. PERCIVAL, M. D.

THE MOTOR WORLD

Volume XIX. New York, U. S. A., Thursday, December 10, 1908. No. 11

A. L. A. M. DISPOSES OF OLDS

Company Finally Dropped for Non-Payment of Royalties—Chalfant Promoted to Post of General Manager.

As a final step in the case of the Olds Motor Works, of Lansing, Mich., whose Selden license was recently cancelled by the Electric Vehicle Co., for non-payment of royalties, the board of managers of the Association of Licensed Automobile Manufacturers at a meeting on Thursday, the 3d inst., dropped the Olds company from the Association. This action was taken following a meeting of a special committee the day previous, at which the Olds company was given apportunity to present whatever reasons it cared to offer as to why it should not be put out of the organization.

The special committee's meeting was called in accordance with Article XVI. of the Association's agreement with its members, which stipulates that a hearing be given before a member may be expelled. F. L. Smith, vice-president of the Olds Motor Works, had asked that the hearing be postponed from the date set by the committee, but this request the latter refused to grant. At the meeting the committee was unanimous in its recommendation to the Association that the Olds company be removed from the membership. The report of the committee was approved at the session of the board of managers on Thursday, and the company was accordingly erased from the Association's roster.

E. P. Chalfant, who for several months has been the assistant general manager of the Association, was at the latter meeting elected to the post of general manager, left vacant some time ago by the resignation of Milton J. Budlong. He was also added to the show committee, to take the place of Marcus I. Brock, resigned. The presence of George J. Dunham, president of the new Royal Tourist Car Co., of Cleveland, O., a reorganization of the Royal Motor Car Co. was a feature of the managers' meeting on Thursday.

Those in attendance included: Elmer Apperson, Apperson Bros. Automobile Co.; John S. Clarke, Autocar Co.; W. C. Leland, Cadillac Motor Car Co.; Roy D. Chapin and Lee Counselman, Chalmers-Detroit Motor Co.; M. S. Hart, Corbin Vehicle Corp.; J. H. Becker, Elmore Mfg. Co.; Wm. E. Metzger, Everitt-Metzger-Flanders Co.; H. H. Franklin and G. H. Stillwell, H. H. Frankling Mfg. Co.; E. R. Hewitt, Hewitt Motor Co.; A. N. Mayo, Knox Automobile Co.; S. T. Davis, Jr., Locomobile Co. of America; H. A. Lozier, Lozier Motor Co.; C. W. Matheson, Matheson Motor Car Co.; L. H. Kittredge, Peerless Motor Car Co.; A. L. Pope, Pope Mfg. Co.; George Pope, Pope Motor Car Co.; George J. Dunham, Royal Tourist Car Co.; G. E. Mitchell, Alden Sampson Mfg. Co.; R. H. Salmons, Selden Motor Vehicle Co.; I. H. Page, Stevens-Duryea Co.; E. S. Church, Waltham Mfg. Co.; Thomas Henderson, Winton Motor Carriage Co..

Kansas City to Produce the Wonder.

Automobile manufacture in Kansas City, Mo., is to receive an impetus through the activities of the newly organized Wonder Mfg. Co., which is to make a car known as "The Kansas City Wonder." Charles F. Ettwein, who with L. A. Ettwein and H. N. Strait, is backing the enterprise, has leased a building at 4116 Penn street for factory purposes. About 7,000 square feet of floor space is available. The company is capitalized at $35,000 and proposes to build 200 cars during the coming year.

Mora Bids for Newark Capital.

The Mora Motor Car Co., of Newark, N. Y., is seeking assistance from the Newark Board of Trade in the flotation of $50,000 in bonds. Half the issue is said to have been subscribed for by the directors of the company and it is desired that the Board arrange to help in taking the other half. A meeting of the Board was held on the 1st inst., at which the company made its representations, and promised a production of 350 cars by spring if the bonds are sold.

THOMAS BRANCH FOR NEW YORK

Buffalo Company to Handle Its Own Product in the Metropolis—Hurlburt to be Local Representative.

Concurrent with its intended production of a new, light, shaft driven touring model, the E. R. Thomas Motor Co., of Buffalo, N. Y., has made arrangements for the opening of its own branch in New York City. To head the new branch William B. Hurlburt, formerly president of the Garford Motor Car Co. of New York, has been named. Heretofore the Thomas company has been represented in the Metropolis through an agency, but in 1909 the company's products will be marketed in New York directly through its own salesmen.

Hurlburt has sailed for Europe, to visit the foreign shows and study conditions abroad. Upon his return, however, he will prepare for the organization of the new branch and will make ready to take over the territory which will fall within his domain. Associated with Hurlburt in the new work, C. R. Teaboldt is mentioned, the latter having been identified with Hurlburt both in the Garford company and previously.

Detroit Motor Dickering with Marion.

The Detroit Motor Truck Co., of Detroit, Mich., is dickering with Marion, Ind. on a proposal to move to the latter place. The company wants the Marionites to take $50,000 worth of stock, while Marion's offer is a free factory site. The Commercial Club, of Marion, sent investigators to examine the company's holdings and prospects, resulting in a favorable report.

To Build Automobiles in Boone.

Boone, Iowa, has a new automobile company which is to make cars designed by F. B. Sunderlin, formerly of Des Moines. The backers of the enterprise include with Sunderlin, J. L. Stevens and Dr. C. W. Payne,

Digitized by Google

In the Retail World.

J. M. Abbott has started a garage in Seguin, Tex. He is also contemplating an automobile stage line between San Antonio, Seguin and Austin.

Moline cars are to be handled in Illinois, in all but a few counties, by R. M. Owen & Co. Through its branch houses the company will appoint all sub-agents in the territory.

C. R. Welsh has bought the garage and automobile supply business of Longren Bros., in Clay Center, Kan. With it he will combine a repair business which he has also purchased.

J. E. Atkinson, of Springfield, Mo., moved, on the 1st inst., from his old location, 311 St. Louis street, to 300-302 East Walnut street. His new quarters comprise a two story building.

W. A. Twombley, formerly with the Buffalo branch of the Diamond Rubber Co., has resigned to go with the Iroquois Rubber Co., of Buffalo, N. Y. He will have charge of the tire and sundry department.

O. E. Eskew, of Allenhurst, N. J., sustained a $5,000 loss recently by a fire which destroyed the second story of the Allenhurst garage on Main street. About $2,000 was covered by insurance on the building.

Laverne Cole, of Rockford, Ill., is moving from North Church street to his new garage building on West State street. The structure has been fitted with every facility for garage and repair work, and features a large show room.

G. P. Hall has purchased the interests of W. J. Doherty in the Sterling Motor Co., of Sterling, Ill. The company is now composed of Hall and Harry Burkholder. The former has been the salesman and demonstrator for the concern.

Napoleon Leticq's garage and automobile repair shop in Worcester, Mass., was damaged by fire on the 23d ult., with a loss of about $300. A gasolene tank, which had been ordered out by the authorities three days before, was blamed.

The garage of S. A. Teel and Edward Werkheiser, on First street, Bangor, Pa., was destroyed by fire on the 25th ult. Ten automobiles were also burned, the total loss being approximately $25,000, on which there was little insurance.

John T. Cook has purchased the interests of R. T. Best in the South End Garage, of Newark, N. J. Work has been begun on a new building at 9 Wright street, which he will occupy, and the business will hereafter be known as Cook's Garage.

Willimantic, Conn., is to have a new garage concern, of which Frank Powell and William B. Imer will be the proprietors. It will be known as the Windham Garage Co., and will occupy the new building erected by S. J. Young on a site back of his hotel on Main street.

A branch in Cleveland has been opened by the Forest City Motor Car Co., of Massillon, O., which makes the Jewel car. C. F. Watts is to be the manager, and the branch will be known as the Jewel Motor Car Co. of Cleveland. It will be located at 2174-80 East Ninth street.

The Aberdeen Automobile Co., of Aberdeen, S. D., operated by Cooke and Morehouse, on South Main street, has been purchased by F. W. Boettcher. The large garage of the company will be kept open at all hours and will operate a day and night automobile livery service.

A petition for a receiver has been filed against the Goodyear Auto Tire Repair Co., of Pittsburg, Pa. The action was brought by A. M. Frauenheim, an investor in the company, who claims that the manager, C. A. Vetter, has appropriated the company's property to his personal use.

John P. Trader has been placed in charge of the branch of the Firestone Tire Rubber Co., in St. Louis, Mo. He succeeds F. O. Sawyer, who has disposed of his interests in the company. The branch will hereafter be the pneumatic tire distributing headquarters for Missouri, Oklahoma, Arkansas, Kansas and Texas.

Schedules in bankruptcy of Max Wineburgh, doing business as the American Automart, 1621 Broadway, New York City, show liabilities amounting to $14,181 and nominal assets of $6,950. He also claims some outstanding accounts, the amount undetermined, as his books were removed, he says, by some unknown person.

Edward T. Barton, of Hartford, Conn., who for years has conducted a tire repair business at No. 20 Church street, is in financial difficulties. At a meeting of his creditors he offered 15 cents on the dollar, which if accepted, will permit him to continue. Otherwise bankruptcy proceedings will be necessary. The liabilities are figured at about $3,500.

The Northwestern Auto Co., of Minneapolis, Minn., has taken over the entire building on Fourth street, south, back of the Security Bank building, now occupied by the Bingham-Jordan Auto Co. and the H. Paulmann Co. About $1,500 will be spent for a complete new front before the Northwestern company moves from its present location on Sixth street.

Minneapolis, Minn., is to have a "Motor Mart," located at First avenue and Tenth street south, the lease for which has been taken by H. Paulman & Co., of Chicago, agents for the Pierce Arrow. The property for the site measures 100x159 feet. The building will be only one story for the present, costing $25,000, but three more stories will be added later, at a total cost of $100,000. The corner store will be taken by the lessees, while the balance of the structure will be rented to several other agencies.

The Week's Incorporations.

N. A. A. M. GIVES AID TO A. A. A.

Executive Committee Votes to Extend Financial Assistance—Stoddard Added to the Committee Membership.

In addition to placing a new name on the executive committee's roster and admitting another member to the organization, the regular monthly meeting of the executive committee of the National Association of Automobile Manufacturers, held in New York City on the 2d inst., resulted in the rendering of financial assistance to the American Automobile Association. The committee also set the date for the next annual meeting of the organization as January 20, during the week of the Licensed show at Madison Square Garden.

The Waverley Co., of Indianapolis, Ind., which some time ago bought the Pope-Waverley plant and is operating it, was elected to membership in the association, while C. G. Stoddard, vice-president of the Dayton Motor Car Co., of Dayton, O., was made a member of the executive committee. President Hotchkiss, of the A. A. A., appeared before the members of the committee and made it clear that his association was in considerable need of such financial assistance as the automobile manufacturers could give it. As a result of his representations, the committee decided to recommend that $5,000 be transferred from the N. A. A. M. surplus to the A. A. A. treasury.

The N. A. A. M. committee again took occasion to assert that organization's view that the control of automobile racing in the United States should rest with he A. A. A., and a resolution to this effect was carried. The resolution, however, was declared to have no relation with the announced intention and policy of the A. A. A. of having nothing further to do with motor car racing on circular tracks of a mile or less in circumference.

One of the Pioneers Dead.

Word was received in New York early this week of the death at his home in Somerset, Va., of R. Lindsay Coleman, one of the pioneers of the automobile industry and until its comparatively recent failure, the head of the National Battery Co., of Buffalo. Coleman, however, was best known as an official of the $40,000,000 American Bicycle Co.—the bicycle trust—of which he was president at the time of its collapse in 1903. In 1899 that big combination had commenced to dabble in automobiles, a three-wheel runabout with hot-tube ignition being its first production. It was offered at a popular price and was expected to sweep the country. Instead the Trust had a lot of the junk left on its hands. Later the A. B. C., as it was generally known, organized the International Motor Car Co., which built the Toledo steamer and out of which, by a process of evolution, came the Pope-Toledo gasolene car. When the American Bicycle Co. collapsed after much internal warfare and a bitter fight between Mr. Coleman and Col. Albert A. Pope, which fight continued until the distribution of its assets, Coleman acquired the National Battery Co., and Col. Pope retained practically all else that remained.

American Leatherette in Bankruptcy.

The American Leatherette Mfg. Co., of Buffalo, N. Y., was on the 23d ult., declared a bankrupt, in the United States district court for the western district of New York. William H. Hotchkiss, the referee in bankruptcy, has called a meeting of the creditors for December 14, at 11 a. m. It will be held in the bankruptcy court room, Room 1103, of the D. S. Morgan building, Buffalo.

To Handle B. & S. Goods in New York.

To provide a ready Metropolitan stock of its products, the Billings & Spencer Co., of Hartford, Conn., has appointed Patterson, Gottfried & Hunter, 211 Center street, New York City, distributors for the B. & S. lines in Manhattan and its vicinity. The latter firm will handle the business with dealers on the same basis as the factory.

National Sales is Sales Manager.

The National Sales Corporation, of New York, Chicago and Buffalo, has been appointed factory sales manager for the Bergman Tool Co. The latter concern has bought a large factory site in Buffalo, N. Y., and will manufacture a line of automobile pliers among other accessories.

Clinton Goes with Fiat Import.

Harry T. Clinton, formerly publicity manager for the A. L. A. M., has resigned as secretary of the contest committee of the Automobile Club of America. He has accepted the position of agency manager for the Fiat Import Co., of New York.

Pioneer Auto Top Building Bigger.

Western demands for automobile tops have been such that the Pioneer Auto Top Mfg. Co., of Kansas City, Mo., has begun the erection of a new factory building. It will be two stories high and will be at 1721 Baltimore avenue.

Badger Brass Buys a Factory.

To secure more manufacturing space, the Badger Brass Mfg. Co., of Kenosha, Wis., has purchased the old Meiselbach bicycle factory adjoining its plant. The purchase is subject to court confirmation, but is practically effected.

Goodyear Establishes New Branches.

The Goodyear Tire & Rubber Co., of Akron, Ohio, has established two new branches. The first is in Washington, D. C., at 1026 Connecticut avenue, N. W., and the second in Atlanta, Ga., at 90 Pryor street.

NO CURE, NO PAY, COURT SAYS

Important Decision Involving the Results of Repairs—They Must Prove Effective for a Reasonable Period.

No cure, no pay, is the decision of Justice Lauer, as regards cases where a garage makes repairs upon a car that refuses to run properly for a reasonable length of time thereafter. This decision which is of big importance to owners and repair men alike, was handed down in the Municipal court of the Third Manhattan District in the case of Wyckoff, Church & Partridge vs. August Hecksher, of Huntington, L. I., which came up for trial on Friday, December 4.

The plaintiff sued for $267.12, representing three items: $160 for repairs, $29 for labor and services, and $78.12 for a new armature. Hecksher declared that after a few trips to Huntington and back the car "went dead," and that he refused to pay the bill on the ground that repairs were of no benefit to him or his car. Judge Lauer decided that the plaintiff cannot recover the amount because the car did not continue in "good running condition" for a reasonable length of time. The only item the court ordered Hecksher to pay was the one for the armature.

Beatrice to Try Out Jonz Car.

It will be a trying and anxious day for the demonstrator of the new Jonz car when the machine is put through its paces before the members of the Beatrice Commercial Club, of Beatrice, Neb. The club has agreed to buy $10,000 worth of the stock of the Jonz Auto Co., provided the car performs well and manifests the advantages over other types that are claimed for it by the makers. The manufacturing company is located in Beatrice, and at its small factory is making a car with an engine for which many radical and ingenious features are claimed.

Fickling Leases Big New York Building.

Fickling & Co., Inc., of New York City and New Haven, Conn., have leased a seven story building at 304-6 West Forty-ninth street, Manhattan, where several departments will be added to the present business of top and body manufacture. C. Royce Hough, formerly factory manager of the Pope-Waverley factory, has been engaged as general manager of the company, while D. W. Gluck has been appointed sales manager.

G & J Transfers Graves to Boston.

T. B. Graves, of the G & J Tire Co.'s branch at Chicago, has been appointed New England representative for the company, succeeding D. B. Price. He will make his headquarters in Boston.

TARIFF HEARING IS POSTPONED

American Makers Allowed Time to Meet Importers' Demand for Reduction—Vital Statistics of Home Industry.

Following the preparation of a brief which was printed in last week's issue of the Motor World, members of the Motor Car Manufacturers Tariff Commission presented themselves before the Ways and Means Committee of the House of Representatives at Washington on Monday last, 7th inst., for a hearing on the question of a revision of the Automobile tariff in connection with the framing of a proposed bill by the house committee. As the representatives of the manufacturers' interests were not prepared to present their claims in full, however, they asked for further time in which to prosecute their investigations of the relative labor conditions here and abroad. The request was granted by Chairman Payne, who allowed an extension of two weeks. Benjamin Briscoe, chairman of the American Motor Car Manufacturers Association acted as spokesman for the manufacturers.

As told exclusively in these columns last week, the handling of the tariff matter has been vested in a joint committee representing the Licensed Association and the National Association of Automobile Manufacturers, as follows:

H. B. Joy, Packard Motor Car Co.; A. L. Riker, Locomobile Co.; L. H. Kittredge, Peerless Motor Car Co.;G. H. Stillfell, Franklin Motor Car Co.; E. R. Thomas, E. R. Thomas Motor Co.; R. E. Olds, Reo Motor Car Co.; and Thomas Henderson, Winton Motor Car Co. Accompanying the committeemen on the Washington trip were Alfred Reeves, manager of the A. M. C. M. A.; Charles Stoddard, vice-president and general manager of the Dayton Motor Car Co., Dayton O.; Job Hedges, counsel for the A. M. C. M. A., and Thomas Francis Moore, the New York press agent, whose activities in organizing and promoting various racing organizations and contests have brought him actively into touch with numerous New York interests, notably those of the automobile importers.

Conflicting stories as to the views of the three controlling organizations of the manufacturers have led to some question as to the unanimity of the position which the tariff commission will take in urging a separate classification for automobiles among the imports instead of their present rating among other "manufactures of metal not otherwise provided for," and an adjustment of the duty on a wage equating basis. Inquiry at the offices of the A. L. A. M., however, brought forth an emphatic denial that the members of that body are working for an increase of the duty of from 45 to 60 per cent., as stated last week by a New York technical paper. Further it was learned from an authoritative source that not simply are the members of the manufacturers' tariff commission in perfect accord in representing the advantages of retaining the present duty, but that their views are shared individually by practicaly all manufacturers, regardless of creed or affiliation.

Incidentally, the representations of Charles M. Sherrill, counsel for the Importers' Automobile Salon, made at Washington on the 27th of November, have roused considerable protest from the American makers' side.

In a statement issued over the signature of E. P. Chalfant, general maneger of the A. L. A. M., early this week, the reverse of the importers' picture of the opulence of the American industry is made to appear with great distinctness. Instead of the continued reign of prosperity which Sherrill depicted, it is stated in all frankness that "American automobile manufacturers have not made exorbitant profits, and a relatively small number of them have made profits at all."

It is pointed out that in 1902, when the American industry first began to assume definite and independent proportions, there were just 51 concerns actively engaged in business. During the ensuing five years and up to the beginning of the present year, no less than 270 new concerns have started up, while 155 have been discontinued. Of the original half-hundred only 21 have survived and are at present in business. The total number of going concerns in the industry at the beginning of 1908 was 166, as shown by the accompanying table. There are now listed 253 American manufacturers of automobiles, "of whom," says the statement in question, "about 100 are turning out cars in fair quantity."

"It is safe to say," Chalfant continues, that not 10 per cent. of the American automobile manufacturers are making money. A great deal of the manufacturers' money goes for experimentation. The large amount of capital required and the character of the business eat into the profit of the business very materially. Clearly the industry deserves proper protection from the normal production and the over-production of the European factories, with their cheap labor, low rate of taxes, and preferential rates on manufacturing machinery. In this country the cost of labor is two and one-half times what it is abroad. Materials abroad are cheaper, ground rent is less, the cost of living is less, the industry is taxed less, and all machinery imported for use in a new industry is admitted duty free or at a preferential tariff.

"When making the statement that 90 per cent. of the imported cars arrived in the shape of naked chassis, it was apparently forgotten that just a little more than 40 per cent. of the cars imported during the last twelve months were complete with bodies, and that bodies for the remaining 60 per cent. (by no means all of them minus bodies) would not keep busy for more than a portion of the year even one of the two carriage makers whom Mr. Sherrill mentions as having been kept alive by the business of the importers, whereas all the carriage makers outside the metropolitan district probably do not collectively get a dozen bodies to manufacture in a year for imported cars.

"Tariff rates must afford ample protection to American made goods, and provide a customs duty on imports equal to the difference in cost of production here and abroad."

In the course of an interview subsequent to Monday's visit of the manufacturers' commission to Washington, Benjamin Briscoe, president of the Maxwell-Briscoe Motor Co., is credited with the declaration that although his company has turned out no less than 8,000 runabouts during the last three years, they never have made more than $86 profit per car.

Giving a rough estimate of the cost of production, he said that a car costing $1.000 to build represents about $375 for labor, $600 for the material and $25 for the material used in operating the plant. Abroad the same car can be built for about $595, representing $420 for material, $150 for labor and $25 for operating expenses. With freight charges and 45 per cent. duty added to this the car could be landed here for about $900: which, he thought, goes to show that the present duty is too low, rather than too high.

Vital Statistics of the American Automobile Industry from 1902 to 1907.

	1902	1903	1904	1905	1906	1907	Totals.
New concerns started	*	71	54	51	43	51	270
Discontinued that year	18	30	40	38	29	..	155
Concerns carried over into following year	33	41	14	13	14	..	†115

* Concerns in business 1902, 51; of which 21 now survive.
† In business December 31, 1906, 166.

Harrison Estate Declared Bankrupt.

The estate of William Harrison, president of the Harrison Automobile Co., the Harrison Wagon Works, and the Harrison Land Co., of Grand Rapids, Mich., has been declared bankrupt, in the United States district court. The case was one in involuntary bankruptcy brought some time ago against Harrison personally after his automobile company got into financial difficulties. Harrison filed an answer and demanded a jury trial, but he died before the case was heard. Kirk E. Wicks, referee, has been put in charge of the estate, and schedules of assets and liabilities will be filed with him.

WHO WILL EXHIBIT AT CHICAGO

Show Roster Gives a List of 244 Stands, of Which 94 Will Display Cars—Full Catalog of the Exhibitors.

With customary promptness the list of exhibitors at the Chicago show has been announced long before the opening of the first of the New York exhibitions, although the Chicago dates are still very remote—February 6-15. The roster shows a total of 244 stands, of which 94 will be given over to the display of cars and 131 to the exhibits of parts and accessories. In addition to these, there will be no less than 19 motorcycle displays. The floor plans show that the arrangement of exhibits in the coliseum and First Regiment armory will be much the same as in former years, the main floors and the Coliseum basement being devoted principally to car exhibits while the galleries will be used to stage the accessories. The elimination of the independent commercial section does away with the old Tattersalls academy adjunct of last year's show. The complete list follows:

Coliseum — Main Floor.

Winton Motor Carriage Co., Cleveland, Ohio.
Pope Mfg. Co., Hartford, Conn.
E. R. Thomas Motor Co., Buffalo, N. Y.
Stevens-Duryea Co., Chicopee Falls, Mass.
Peerless Motor Car Co., Cleveland, Ohio.
Elmore Mfg. Co., Clyde, Ohio.
Woods Motor Vehicle Co., Chicago, Ill.
Thomas B. Jeffery & Co., Kenosha, Wis.
Babcock Electric Carriage Co., Buffalo, N. Y.
Baker Motor Vehicle Co., Cleveland, Ohio.
F. B. Stearns Co., Cleveland, Ohio.
Reo Motor Car Co., Lansing, Mich.
Packard Motor Car Co., Detroit, Mich.
Everitt-Metzger-Flanders Co., Detroit, Mich.
Premier Motor Mfg. Co., Indianapolis, Ind.
Studebaker Automobile Co., South Bend, Ind.
National Motor Vehicle Co., Indianapolis, Ind.
Haynes Automobile Co., Kokomo, Ind.
The White Company, Cleveland, Ohio.
Dayton Motor Car Co., Dayton, Ohio.
Cadillac Motor Car Co., Detroit, Mich.
Maxwell-Briscoe Motor Co., Tarrytown, N. Y.
Locomobile Co. of America, Bridgeport, Conn.
H. H. Franklin Mfg. Co., Syracuse, N. Y.
Apperson Bros. Automobile Co., Kokomo, Ind.
Buick Motor Co., Flint, Mich.
Holzman Automobile Co., Chicago, Ill.
Pope Motor Car Co., Hartford, Conn.
American Locomotive Co., 1886 Broadway, New York.
George N. Pierce Co., Buffalo, N. Y.
Olds Motor Works, Lansing, Mich.
Corbin Motor Vehicle Corporation, New Britain, Conn.
Matheson Motor Car Co., Wilkes-Barre, Pa.
Knox Automobile Co., Springfield, Mass.
The Bartholomew Co., Peoria, Ill.
Lozier Motor Co., Broadway & 55th street, New York.
De Luxe Motor Car Co., Detroit, Mich.
Mitchell Motor Car Co., Racine, Wis.
Ricketts Auto Works, South Bend, Ind.

Coliseum Annex — First Floor.

Chalmers-Detroit Motor Co., Detroit, Mich.
Simplex Motor Car Co., Mishawaka, Ind.
York Motor Car Co., York, Pa.
Austin Automobile Co., Grand Rapids, Mich.
Oakland Motor Car Co., Pontiac, Mich.
Pennsylvania Auto-Motor Co., Bryn Mawr, Pa.
Midland Motor Co., Moline, Ill.
Welch Motor Car Co., Pontiac, Mich.

First Regiment Armory — Main Floor.

Kissel Motor Car Co., Hartford, Wis.
Speedwell Motor Car Co., Dayton, Ohio.
Buckeye Mfg. Co., Anderson, Ind.
Jackson Automobile Co., Jackson, Mich.
Columbus Buggy Co., Columbus, Ohio.
Moon Motor Car Co., St. Louis, Mo.
Atlas Motor Car Co., Springfield, Mass.
Dorris Motor Car Co., St. Louis, Mo.
Overland Automobile Co., Indianapolis, Ind.
Cartercar Company, Detroit, Mich.
The Waverley Co., Indianapolis, Ind.
W. H. Kiblinger Co., Auburn, Ind.
Mora Motor Car Co., Newark, N. Y.
Nordyke & Marmon Co., Indianapolis, Ind.
Moline Automobile Co., East Moline, Ill.
Auburn Automobile Co., Auburn, Ind.
Anderson Carriage Mfg. Co., Anderson, Ind.
Chicago Coach & Carriage Co., Chicago, Ill.
Rapid Motor Vehicle Co., Pontiac, Mich.
Black Mfg. Co., Chicago, Ill.
Meteor Motor Car Co., Bettendorf, Iowa.
Streator Motor Car Co., Streator, Ill.
Stayer Carriage Co., Chicago, Ill.
Anderson Carriage Co., Detroit, Mich.
Model Automobile Co., Peru, Ind.
J. V. Lindsley & Co., Dowagiac, Mich.
Ft. Pitt Motor Mfg. Co., New Kensington, Pa.
Wayne Works, Richmond, Ind.
Gaeth Automobile Co., Cleveland, Ohio.
Berliet Import Co., Chicago, Ill.
Rauch & Lang Carriage Co., Cleveland, Ohio.
C. P. Kimball & Co., Chicago, Ill.

Coliseum Basement.

Zimmerman Mfg. Co., Auburn, Ind.
Joseph Devore, Chicago, Ill.
Schacht Mfg. Co., Cincinnati, Ohio.
Randolph Motor Car Co., Chicago, Ill.
The Rider-Lewis Motor Car Co., Muncie, Ind.
Interstate Automobile Co., Muncie, Ind.
The Bendix Co., Chicago, Ill.
E. R. Thomas Motor Co., Buffalo, N. Y.
Owen Thomas Motor Car Co., Janesville, Wis.
Grabowsky Power Wagon Co., Detroit, Mich.
20th Century Motor Car Co., South Bend, Ind.
Clark-Hatfield Auto Co., Oshkosh, Wis.
Mier Carriage & Buggy Co., Ligonier, Ind.
The Cameron Car Co., Beverly, Mass.
The Fellwock Auto & Mfg. Co., Evansville, Ind.

Coliseum Annex—Second Floor.

Minneapolis Motor Cycle Co., Minneapolis, Minn.
The Pierce Cycle Co., Buffalo, N. Y.
Merkel-Light Motor Co., Pottstown, Pa.
Reading Standard Co., Reading, Pa.
Hornecker Motor Mfg. Co., Genesee, Ill.
Armac Motor Co., Chicago, Ill.
New Era Gas Engine Co., Dayton, Ohio.
Magnet Motor Co., Chicago, Ill.
Hendee Mfg. Co., Springfield, Mass.
Harley-Davidson Motor Co., Chicago, Ill.
Excelsior Motor & Mfg. Co., Chicago, Ill.
Wagner Motor Cycle Co., St. Paul, Minn.
Consolidated Mfg. Co., Toledo, Ohio.
Ovington Motor Co., New York.
Aurora Automatic Machinery Co., Aurora, Ill.
Thiem Mfg. Co., Minneapolis, Minn.
The Auto-Bi Co., Buffalo, N. Y.
American Motor Co., Brockton, Mass.
N. S. U. Motor Co., New York.

Coliseum Gallery.

Motor & Accessory Mfrs., Inc., Union Bldg., Newark, N. J.
The Sprague Umbrella Co., Norwalk, Ohio.
Cooks Standard Tool Co., Kalamazoo, Mich.
A. O. Smith Co., Milwaukee, Wis.
Imperial Brass Mfg. Co., 3455 South Jefferson street, Chicago.
Hartford Suspension Co., 150 Bay street, Jersey City, N. J.
C. A. Shaler Co., Waupun, Wis.
Valentine & Co., 257 Broadway, New York.
The Republic Rubber Co., Youngstown, Ohio.
Auto Improvement Co., 316 Hudson street, New York.
American Electrical Novelty & Mfg. Co., 304 Hudson street, New York.
Hancock Mfg. Co., Charlotte, Mich.
Atwater Kent Mfg. Works, 42 N. 6th street, Philadelphia, Pa.
Warner Instrument Co., Beloit, Wis.
N. Y. & N. J. Lubricant Co., 14 Church street, New York.
F. H. Wheeler, P. O. Box 276, Indianapolis, Ind.
Vesta Accumulator Co., 1334 Michigan avenue, Chicago, Ill.
Whitney Mfg. Co., Hartford, Conn.
Motsinger Device Mfg. Co., Pendleton, Ind.
A. W. Harris Oil Co., Providence, R. I.
Morgan & Wright, Detroit, Mich.
R. E. Dietz Co., 60 Laight street, New York.
Timken Roller Bearing Axle Co., Canton, Ohio.
The Hartford Rubber Works Co., Hartford, Conn.
McCord Mfg. Co., Detroit, Mich.
Chicago Battery Co., Chicago, Ill.
The Diamond Rubber Co., Akron, Ohio.
Brown-Lipe Gear Co., Syracuse, N. Y.
Spicer Universal Joint Mfg. Co., Plainfield, N. J.
The Veeder Mfg. Co., Hartford, Conn.
Gray & Davis, Amesbury, Mass.
G & J Tire Co., Indianapolis, Ind.
National Carbon Co., Cleveland, Ohio.
The B. F. Goodrich Co., Akron, Ohio.
C. F. Splitdorf, 265 Walton avenue, New York.
Gabriel Horn Mfg. Co., Cleveland, Ohio.
Goodyear Tire & Rubber Co., Akron, Ohio.
Long Mfg. Co., 119 Michigan street, Chicago, Ill.
Swinehart Clincher Tire & Rubber Co., Akron, O.
Jones Speedometer, 127 West 32d street, New York.
R. E. Hardy Co., 86 Watts street, New York.
Warner Gear Co., Muncie, Ind.
Diamond Chain & Mfg. Co., Indianapolis, Ind.
Wm. Cramp & Sons Ship & Engine Bldg. Co., Philadelphia, Pa.
The Electric Storage Battery Co., Philadelphia, Pa.
Pennsylvania Rubber Co., Jeannette, Pa.
Heinze Electric Co., Lowell, Mass.
Baldwin Chair & Mfg. Co., Worcester, Mass.
Remy Electric Co., Anderson, Ind.
Duff Mfg. Co., Pittsburg, Pa.
Firestone Tire & Rubber Co., Akron, Ohio.
M. & A. M., Inc., office.
Never-Miss Spark Plug Co., Lansing, Mich.
Oliver Mfg. Co., 203 S. Desplaines street, Chicago.
S. F. Bowser & Co., Inc., Fort Wayne, Ind.
The Edmonds & Jones Mfg. Co., Detroit, Mich.
Kokomo Electric Co., Kokomo, Ind.
Byrne-Kingston & Co., Kokomo, Ind.
Weed Chain Tire Grip Co., 28 Moore street, New York.
The Pantasote Co., 11 Broadway, New York.

Coliseum Annex - Second Floor.

Stewart & Clark Mfg. Co., 502 Diversey boulevard, Chicago.
C. T. Ham Mfg. Co., Rochester, N. Y.
Gray-Hawley Mfg. Co., 605 Fort street, Detroit, Mich.
J. H. Sager Co., Rochester, N. Y.
Ajax-Grieb Rubber Co., 1776 Broadway, New York.
Joseph Dixon Crucible Co., Jersey City, N. J.
Ross Gear & Tool Co., Lafayette, Ind.
National Coil Co., Lansing, Mich.
Adam Cooks Sons, 313 West street, New York.
Continental Caoutchouc Co., 43 Warren street, New York.
Leather Tire Goods Co., Newton Upper Falls, Mass.
Connecticut Telephone & Electric Co., Meriden, Conn.
Witherbee Igniter Co., 591 West 43d street, New York.
Motz Clincher Tire & Rubber Co., Akron, Ohio.
Whiteley Steel Co., Muncie, Ind.
National Battery Co., Buffalo, N. Y.
L. C. Chase Co., 89 Franklin street, Boston, Mass.
Michelin Tire Co., Milltown, N. J.
The Globe Machine & Stamping Co., Cleveland, O.
The Hoffecker Co., Motor Mart, Boston,, Mass.
Fox Metalic Tire Belt Co., 15 Murray street, New York.
The Randall-Faichney Co., Boston, Mass.
Avery Portable Lighting Co., Milwaukee, Wis.
Pittsfield Spark Coil Co., Dalton, Mass.
Limousine Carriage Mfg. Co., 3515 Michigan avenue, Chicago, Ill.
Empire Automobile Tire Co., Trenton, N. J.

First Regiment Armory Gallery.

London Auto Supply Co., 1229 Michigan avenue Chicago, Ill.
Austro-American Separator Co., Cleveland, Ohio.
Edward Neely & Co., 244 Wells street, Chicago.
Metal Stamping Co., 40 Hubert street, New York.
Central Rubber Co., 82 Lake street, Chicago, Ill.
Vivax Storage Battery Co., 2224 Michigan avenue, Chicago, Ill.
Commercial Battery Electric Co., 204 Michigan street, Chicago, Ill.
Morrison-Ricker Mfg. Co., Grinnell, Iowa.
S. Breakstone, 900 Fisher Bldg., Chicago, Ill.

WHITE WINS

Los Angeles to Phoenix Road Race

A brilliant victory was scored by the White Steamer in the recent stock-car race through the mountains and over the desert from Los Angeles, California, to Phoenix, Arizona. Once again the White demonstrated that in a stock-car competition and over roads such as exist in most parts of the country it is faster than any other type of machine. Such a contest as the Los Angeles-Phoenix race is far more significant than a race between specially built cars over specially selected and carefully prepared highways. This latest White victory indicates to the purchaser just what kind of service he may expect from the type of car which he can buy and over roads such as he will have to cover.

The White is the fastest car on give-and-take roads, not because it has the highest-powered engine, but because it delivers at the rear wheels a larger percentage of the power of the engine than any other type. Furthermore, that power is available under all conditions, whether running fast or slow, and no time is lost in shifting gears or in waiting for the engine to "pick up speed." In other words, under ordinary road conditions, the flexibility of the White engine will do what great power in other types of engines cannot do.

Write for circular describing the 1909 models.

Cable Address, "MOTORWORLD," NEW YORK.

Entered as second-class matter at the New York Post Office, November, 1900.

NEW YORK, DECEMBER 10, 1908.

The Congressional Viewpoint.

Tickets for Washington enjoy prospects of a good sale among those of the trade who are interested or affected by the tariff on motor cars and who are concerned about seeing it kept where it is. Many of the visitors will doubtless be oppressed with spells of the feeling which is common to most folks having no more than occasional contact with congress, that the big institution on Capitol Hill is hard to fathom because of the difficulty of getting the congressional viewpoint. To sell a man goods or to try a case before a court of law presents no great perplexities as to the general principles of campaign, but the aggregation of men known as "congress" are in the tariff matter neither prospective customers nor jurists on the bench. That particular group constituting the ways and means committee of the house of representatives, in the hands of which committee any changes in the motor car tariff largely lie, is supposed to be actuated in its deliberations and decisions by no other considerations than patriotism and the public good, which theoretically removes it from suspicion of either self-interest or a weakness for purely technical judgments.

Nevertheless, those familiar with Washington matters know that members of congress are very human in their limitations. The old campaigners on the ways and means committee have won their places there by recognizing public desire and public good as the same things, except when the speaker of the house shows them that his desire is it for the moment. Popular agitation for revision of the tariff has ultimately got to be met by some reductions, and in recognition of this the committee is cautiously finding out who will holler the least when the operation takes place, and on what items the schedule may be trimmed with the greatest flourish.

Whether the automobile be represented to the committee as a luxury like champagne or an every day article like wool cloth will make little difference. Even the elaborate statistics that will be elicited as to the industry and of which the committee will gravely make record, will not be subjected to much analysis or taken as seriously as the compilers might wish. But if the array of good, solid, likable American business men earnestly desiring to have the motor car tariff kept exactly where it is, greatly preponderates over the number of importers who want it removed or lowered, and these same American business men show up numerically strong in the committee room in the role of live citizens in their respective communities, having a touch of fighting blood in their veins, the tariff on automobiles will not be changed.

Cone Clutch Improvement.

Clutch construction has undergone many alterations in the course of the development of the motor car and it is remarkable that in so large a number of instances of otherwise advanced design that type of clutch is still employed which most nearly resembles the device associated with the earliest types of sliding change gear. Yet the plain cone clutch, however well it may have served its purpose in the past, and regardless of the manifold improvements which have been effected in its mounting and in other of its details, is yet possessed of so many drawbacks that in order to obviate them as completely as possible it becomes mechanically rather more complex than is wholly to the liking of the average engineer and much more so than is to the liking of the non-technical driver who is occasionally forced to wrestle with its parts.

Among the objections to its use which may be advanced, one of the most important is that its actuation requires a not inconsiderable amount of longitudinal pressure. In order to counteract this either the transmission mechanism must be made to include some sort of thrust bearing, or else the clutch itself must be so contrived as to absorb its own reaction, so to speak, thus becoming virtually self-contained. The most familiar method of bringing this about is to invert the two conical members which constitute the clutch proper, causing the driven cone to engage the female member attached to the fly wheel from the front or engine side. This system has been used to a considerable extent and with fairly good results. Several considerations which weigh against it, however, have caused it to be abandoned by a number of makers who were firm adherents of it for a time.

A possible combination of the two types of direct and inverted cone has recently come to notice in foreign practice, which seems to do away with several of the objections against either individual type, also combining with some of their advantages the additional feature of permitting the use of a large amount of frictional surface without requiring the large diameter which is one of the most prominent faults of the simple type. In this arrangement two pairs of cones are employed, the fly wheel having a conical face formed directly in it, and a second and inverted face formed by a ring member which is positively attached to it. Two male cones placed back to back and separated by a spring are adapted to engage the fly wheel surfaces.

Against the unquestionable complication of this arrangement it must be admitted that the elements of self-containment, freedom from the necessity for rotating thrust bearings, large area of contact and possible small diameter, count strongly in its favor. Further, it should prove less difficult to align than the plain cone types, provided the shaft is freed from dead weight. With a small amount of movement to release or engage, and with the possibility of considerable slippage without serious abrasion of the contacting surfaces, the idea is suggestive of numerous advantages which may be obtained in no other way with cone clutches.

FORCE DEVELOPED IN COLLISIONS

Tremendous Effects of Kinetic Energy in Sudden Changes of Direction—Startling Possibilities of Motion.

Probably no one who has had the painful experience of being thrown from a motor car which was traveling at a high rate of speed has cared to stop and figure out just how much kinetic energy his body possessed at the instant it struck earth, nor how much force was involved in the impact when the car landed against some friendly obstacle. Nevertheless it is possible to calculate the forces in action at such times, and some consideration of their nature leads to a sane conclusion as to the importance of exercising a due amount of caution when driving a machine which is capable of very high rates of speed.

In its own serious way, the Scientific American analyses the potential source of damage which is stored in a car when running at various speeds, and incidentally reveals why in some cases cars which have collided with some permanent object when going very fast have been, so to speak, "smashed all to pieces." "An automobile, or, for that matter, any very swiftly moving vehicle is, in effect, a projectile which differs in no essential respect from a shell discharged from a modern field piece," that authority explains.

The kinetic energy which a projectile possesses in virtue of its mass and velocity is necessarily expended in destructive action when the flight of the projectile is suddenly arrested by an obstacle of any sort. The destructive effects are divided between the projectile and the obstacle in the inverse ratio of their respective powers to resist deformation. . . . . In automobiles and other vehicles the conditions are essentially the same as in the case of the projectile. If, for example, the brakes are applied to an automobile when it is running at full speed, the kinetic energy of the forward motion is gradually absorbed by the friction between the brakes and the wheels, and converted into heat, and the car is gradually brought to rest. Again, if the motor is stopped without applying the brakes, the energy of motion is gradually used up in overcoming the resistance of the air, the rolling resistance at the points of contact with the road, and the friction at the axle bearings. The car, therefore, comes to rest, after running a distance inversely proportional to the magnitude of these frictional and other resistances.

"To continue the comparison with a projectile, let us suppose that the car, running at full speed, is stopped against a light picket fence, and the motor is stopped. The car will shatter the fence and go through it almost unharmed and with little loss of speed, but if it encounters a succession of similar obstacles it will finally be brought to a stop. Nor would one solid board fence stop the automobile, though it would reduce its speed, but the car would probably dash itself to pieces against a rocky cliff or stout masonry wall, without materially affecting either of these obstacles. In short, the weaker of two colliding bodies sustains most of the damage caused by the collision.

"The effect depends also on the distance run by the vehicle between the first moment of impact and its final stoppage. Other things being equal the intensity of the destructive forces is inversely proportional to this distance, and the disintegrating effect of these forces depends more on their absolute intensity than upon the length of time during which they act. Hence a sudden stoppage, as in the case of collision with a stone wall, develops forces which the strongest materials cannot withstand.

"At the moment of impact against an obstacle the moving car possesses a certain kinetic energy which is equal to the product of the force required to bring it to rest multiplied by the distance through which that force acts. The kinetic energy is also equal to the mass of the car multiplied by half the square of its velocity. For a car weighing one ton and running at a speed of 30 miles per hour the kinetic energy is equal to 60 foot tons, or the work done in lifting the car 60 feet. In other words, the velocity of 30 miles per hour is about equal to the velocity acquired in falling 60 feet, and if a car moving with this velocity strikes an immovable obstacle it will fare as badly as it would in striking the ground after falling 60 feet. The force of the impact is proportional to the square of the velocity, and the sudden stoppage of a car going 60 miles an hour is equivalent to a fall of 240 feet.

"Now let us examine the conditions existing immediately after the impact. An automobile is an assemblage of many parts, of various degrees of strength. The shock is transmitted from the point of impact through all the parts, producing in each a tendency to break at its weakest point.

"The work done in pulling apart a steel bar one foot long and one inch square is equal to nearly 4½ foot tons, but an automobile weighing one ton and running 60 miles an hour possesses energy enough to sunder 25 such bars, or 50 steel bars of the same cross-section and half the length either successively or simultaneously. The same amount of energy would suffice to shear off 260 1-inch steel bolts or rivets, 50 ¾-inch bolts, 2,500 oak pins one inch square, or 25 oak beams 10 inches square. The energy of the car is one-fourth greater than that of the 12-pound shot which leaves the muzzle of a 3-inch gun with a velocity of 1,000 feet per second. Such a shot is crushed on striking an armor plate of hardened steel, although it is protected by a steel cap, and as a whole is stronger than any part of an automobile.

"In a head-on collision between two cars of equal weight and speed the amount of kinetic energy destroyed is twice the amount involved in the impact of either car against a fixed obstacle, but the destructive action is divided equally between the two cars so that the effect on each is equivalent to the effect produced by running into a stone wall. In a collision between a heavy and a light car, the latter suffers." ,

COMING EVENTS

December 12, Denver, Col.—Denver Motor Club's hill climbing contest, Lookout Mountain.

December 12, Worcester, Mass.—Worcester Automobile Club's 200 miles reliability and endurance contest.

December 31-January 7, New York City—American Motor Car Manufacturers' Association's annual show in Grand Central Palace.

January 1-2—Quaker City Motor Club's two days endurance run, Philadelphia to Wilkes-Barre, Pa., and return.

January 16-23, New York City—Association of Licensed Automobile Manufacturers' annual show, Madison Square Garden.

January 21-31, Los Angeles, Cal.—Automobile Dealers Association's show.

January 23-30, Philadelphia, Pa.—Philadelphia Automobile Trade Association's annual show.

January 27-February 3, Philadelphia, Pa.—Automobile Trade Association's eighth annual show, Second Regiment armory.

February 6-15. Chicago. Ill.—National Association of Automobile Manufacturers' Show, Coliseum and First Regiment Armory.

February 15-20, Cleveland, O.—Automobile show, Central Armory.

February 15, Detroit, Mich.—Detroit Automobile Dealers Association's show, Wayne Pavilion.

February 15-20, St. Louis, Mo.—Automobile Manufacturers and Dealers Association's annual show.

February 16-18, Denver, Col.—Denver Motor Club's first annual show, Auditorium.

February 22, Ceveland, O.—Cleveland Automobile Dealers Company's show, Central Armory.

February 27-March 3, Hartford, Conn.—Automobile Dealers' Association show.

March 1-6, Omaha, Neb.—Omaha and Council Bluffs dealers' show, Auditorium.

March 6-13, Boston, Mass.—Boston Automobile Dealers Association's (Inc.) seventh annual show, Mechanics Building.

March 10-13, Memphis, Tenn.—Automobile show, Auditorium building.

March 27-April 3, Pittsburg, Pa.—Automobile Dealers Association's show, Duquesne Garden.

Digitized by Google

ART FEATURES FOR PALACE SHOW

Early English Decorative Scheme Includes Much Statuary—Automobiling Scenes to Form Huge Frieze.

"Wisdom instructing Youth in the mysteries of automobile construction," is to be the piece de resistance about which will center the decorative scheme of the Grand Central Palace when the first of the New York Shows is thrown open to the public on New Year's Eve. Besides Wisdom numerous other allegorical figures will grace the

STATUE FOR LOBBY

hall which has wont to be so barren in previous years, and these taken in conjunction with the general treatment which is characterized as being of "an early English style," will serve to make the setting of the show quite the most effective yet produced in the Palace.

Because the Palace Show is to be the only international exhibition of the year, the show committee of the American Motor Car Manufacturers' Association has seen the wisdom of searching abroad for the materials to be used in framing the setting. Accordingly representatives of the S. R. Ball Co., have been scouring England, France and Italy as well as this country for ideas to be used in embellishing the exhibition in befitting style. Wisdom personified in a figure of heroic mould is the crowning achievement, but it is not to be permitted to stand alone. The decorations instead of being confined to the interior of the building will be displayed externally in the form of an elaborate port cochere, while the entrance hall will be treated with the same care to rob it of its present dull appearance.

As announced some time ago, the first impression of the show will be of no small brilliancy, caused by the illumination of the port cochere, with its statuesque supporting figures, its ornamental balustrade and the illuminated ornamental background above, which embodies a deep frame surrounding an oil painting of a very wonderful car in mad flight and leaving behind it an illuminated trail of comet-like aspect.

The vestibule inside will be draped with the flags of the nations and with ornamental large urns, while at the stairway approach will be two life size female figures resting on an eagle supporting a wheel, one of which is here depicted. They are finished in verde antique, which is a press agent name for copperish green. The entire ceiling of the entrance hall leading to the main stairways will be canopied in silk with streams of electric light radiating from the center. The side walls will be decorated with mural paintings typifying various scenes dear to the heart of the motorist.

The main auditorium hall or "court of honor" will be the section subjected to the early English style of treatment. The balconies will be partially hidden by red orange colored tiling, which will extend some three feet outwards over the main hall, while carried down to a level and meeting the tops of the present capitals of the halls will be a frieze of scenes depicting automobile races and contests, including the Glidden Tour, the Vanderbilt Cup Race, and the Savannah road race. The main auditorium will have its ceiling covered with a fabric, atmospheric blue in color, which combined with lattice work, boxes, and urns of flowers and growing plants, will give to the gallery a hanging garden effect. At the end of the hall now occupied as a part of the stage, a real garden will be formed by bay trees, evergreens and flowers, together with a number of singing birds hung in gilded cages. By means of immense mirrors the effect will be accentuated and duplicated.

To divide the garden from the general exhibition hall, the show committee has selected "Wisdom and Youth," otherwise described as "a striking piece of statuary some 15 feet in length and 5 or 6 feet high, with life sized allegorical figures representing "Wisdom instructing Youth in the mysteries of automobile construction." In addition ten statues of original composition and heroic size will uphold garlands of flowers and streamers of electric light, which will lead to a sunburst chandelier in the center of the hall.

For the general decorations the prevailing tone will be white and gold, with festoonings of Berlin green, while for the floor covering, 8,500 yards of a specially woven bronze colored fabric will be used, instead of the usual denim. The tables, counters, railing and furniture will be a rich dark green in color, while the signs displaying the names of each car or exhibitor, will be of white with gold letters and moulding and green shading. They will be made of compo-board instead of oilcloth while the accessory exhibits will be graced in addition by a silk gold fringed banner suspended from a standard.

Refreshments this year will be served from a modern version of an old English inn, located in the third floor. It was at first intended to build a German wine cellar, it is painstakingly explained, but in order to harmonize with the prevailing style of architecture the management decided to

GODDESS OF SPEED

change it into a room modeled after the interior of a famous Kentish inn. To this end a stone wall effect will divide the room from the main exhibition hall, while old chandeliers, antique pewter dishes and mugs will lend color to the effect.

Dates for the Pittsburg Show.

The dates selected for the automobile show at Pittsburg, Pa., are March 27 to April 3, inclusive, and the affair will be held at the Duquesne Garden. The management will be in the hands of a committee of the automobile dealer's association, as in previous years.

Accessory Makers to Dine at Sherry's.

The Motor and Accessory Manufacturers, Inc., has decided to hold annual dinners, during show time each year. The first of these affairs will take place at Sherry's, New York City, on Wednesday evening, January 20.

BOUNCING UP DOLLY COLE HILL

Baldwin Wins Rhode Island Hill Climbing Trophy a Third Time—Thrilling Speed on Rough and Snakey Incline.

Virtually winning the C. Prescott Knight cup for the third successive year, L. F. N. Baldwin, driving a Stanley steamer, became entitled to the permanent possession of that trophy on Saturday last, 28th inst., at the Rhode Island Automobile Club's seventh annual hill climb, although the "official results" are at present witheld. The contest was on "Dolly Cole" hill, Foster, near Providence—a slope six-tenths of a mile in length with an average grade of 7 per cent. Four events were on the program, a free-for-all being the feature of the afternoon.

It was in the latter event that Baldwin made the unofficial whirlwind time of 34 seconds, according to the clocker's watches, it having been announced just before the contest started that for some reason or other no official times would be given out for several weeks. In the field against Baldwin were three other contenders: William Bourque in a 50 horsepower Knox, J. P. Grady in a 40 horsepower Pope-Hartford and Joe Matson at the wheel of a 30 horsepower Corbin. Starting 50 feet back of the mark, the cars had the advantage of a slight down grade to increase their momentum before hitting the hill. All four made good ascents, but Baldwin in the specially built steam freak, again showed that at a short distance in a concentrated burst of speed, such a car is beyond the class of stock gasolene machines of the sort that are capable of sustaining high speed for hundreds of miles. Nevertheless, under the conditions of the deed of gift, Baldwin proved conclusively that he is entitled to the cup he has been striving three years to win. His ascent had some thrill in it, too. The hill was considerably curved and when Baldwin negotiated the dangerous "S" bend, he skidded around its snakey turns, on two wheels, slewing from one side of the road to the other, in a manner that jarred the nerves of the crowd of spectators. Rough stretches on the course made the steam kettle and some of the other contestants bounce along in wild fashion. Bourque in the Knox was reported to have made second best time in this event in 0:40, and Grady's Pope-Hartford showed up third in 0:41.

J. F. Corbett at the wheel of a Corbin, C. M. Linton with a Jackson, and Bourque in a smaller Knox were the contestants in the 24-40 horsepower class. Bourque shot up the incline at a terriffic clip and looked like a sure winner, but the judges failed to get his time at the start and he was forced to make the trial a second time. As it was, his second attempt, while possibly not as fast as his first, proved to be the best of the class, with Corbett second.

The 15-20 horsepower class saw one lone entrant, Oliver Light in a Chalmers-Detroit, while one event on the program was not run at all owing to the non-appearance of any of the entrants at the starting tape. In the one remaining bout, two steamers were the only starters: Baldwin and Blackington in 20 horsepower runabouts, Baldwin winning.

When the times are announced by the committee some weeks hence, the official figures still may be subject to inaccuracies in the majority of instances, due to the crude and inexact method of timing employed. It is obvious that in about every case the time must be at least a fraction of a second out of the way. As a means of clocking the cars a telephone was employed, with wires running from start to finish. The starter at the base of the hill would yell the word "go" into the telephone receiver as the cars thundered past the starting tape and the judges at the summit would set their stop-watches upon hearing the signal transmitted. The noise of the cars prevented the signal being heard clearly at first, causing Bourque and another contestant to run their heats a second time, when the judges failed to clock them. After this method proved unsatisfactory, it was arranged to signal the judges by the sounding of a telephone gong, when the receiver was removed from the hook—a process not as accurate as it might have been.

Endurance Run to Test a Magneto.

Endurance tests of cars have been planned and carried out under all sorts of conditions until they have lost a large part of their novelty and interest to the outsider, though they still continue to absorb the participants, but an endurance trial of a car made for the sake of trying out the durability of an accessory as well as to demonstrate its characteristics is rather out of the ordinary, even at this time. Just such a test, however, is being made by A. T. Mosher and Harry Harter, salesmen for the Remy Electric Co., who recently commenced a tour from the Anderson (Ind.) factory of the company, to Savannah and return, the route to include New Orleans, Galveston and St. Louis. The runabout they are using is equipped with one of the new Remy magnetos which, in addition to furnishing the ignition current for the motor, will serve a useful purpose in demonstrating to local dealers, garagemen and mechanics, the simplicity of the system as well as its durable qualities.

Big Purse for Road Race in Nevada.

Out in Goldfield, a party of capitalists who have been infected with the motor racing microbe, have come forward with the offer of a $30,000 purse to the automobile owners and drivers of the world, as an inducement to participate in a proposed road race to be held in Nevada next spring. According to correspondence from Reno, the movement is being headed by Tex Rickard and Tom Murphy, two wealthy mining men.

DES MOINES SEES FAST CLIMBING

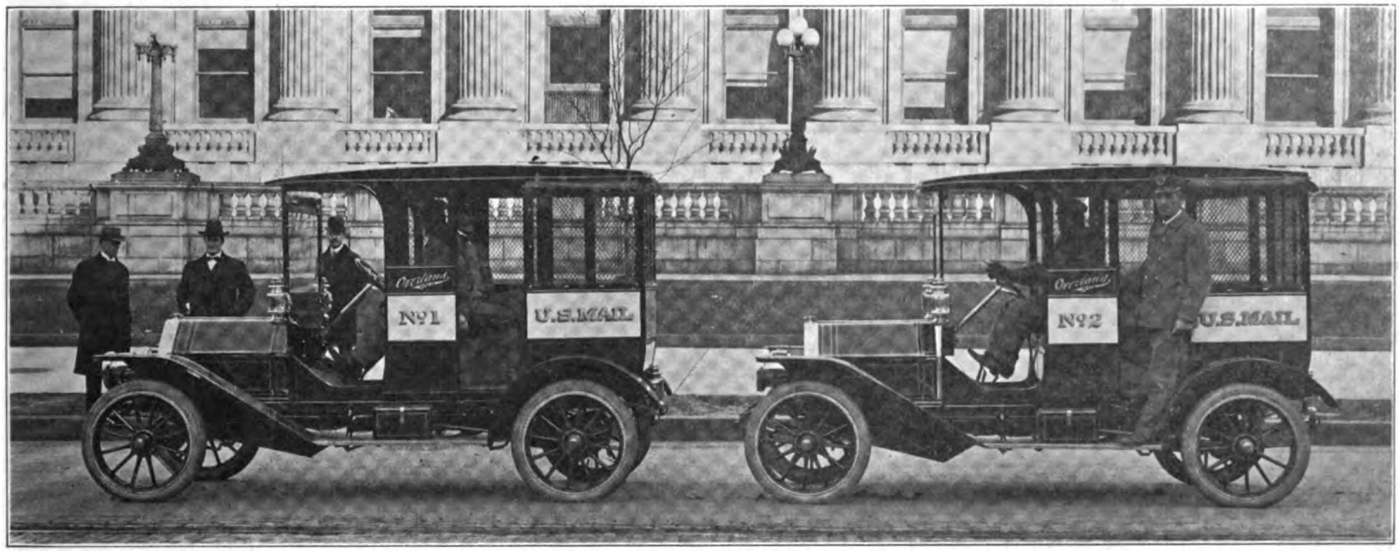
Berner Drives a Steamer up West Grand Avenue Hill in Best Time—Twenty-Two Cars in Lively Contest.

In a bitter cold wind sweeping through the open country, on one of the chilliest days that Des Moines (Iowa) has seen this season, a large crowd of motor enthusiasts turned out to witness the Iowa Automobile Association's informal hill climb of Wednesday, December 2. It was the first contest of the kind ever held by this club and it took place on a slope on West Grand avenue, the course being three-fifths of a mile in length. The entry list, numbering more than a score of contestants, was gratifying to the promoters of the affair and a number of the drivers made good, if not phenomenal time.

There was no division as to class or price for the various contestants, though some of the 22 competitors were given two or three tries at the climb. One steamer was entered. This car, a Stanley, with Berner up, made the climb in 44½ seconds, which was 2 seconds better than its nearest competitor. Of the gasolene cars, Van Slyck, driving a Chalmers-Detroit "40", made the best performance. Starting up the incline with a good jump, he ate up the smooth, hard road with his engine singing a pretty tune and his tires kicking up the fine dust, in 0:46½. An ascent almost as lively and every bit as spectacular was that of Wallace, in the Stoddard-Dayton, who swung up the grade only one-half second slower. Many thought he had made the best time, until the announcement of 0:47 was made. Dr. Parriott, on his second trial in a Mason, also scored this figure.

In the early part of the contest, it seemed as though the light low priced cars were going to outdo their larger brothers. Harper, the first starter in one of the smallest mounts set up a figure of 0:49 flat and made the rest of the field realize that they would have to show some class. Then a few more contenders made the attack, Sears's Ford and Dr. Fellows's Buick among them, and all fell short, the latter making the slowest time of the meet—1:14. Following this, Dusenberg, in a Mason car, ripped off 0:51 flat, after which three other Masons made trials in 0:49 and 0:48 flat. Several of the small cars hit these same marks, making creditable showings.

Topeka Motor League Revives.



After lying dormant for some time, the Topeka Motor League has suddenly resurrected itself and hopes to flourish as it did in the days of yore. A new board of directors has been chosen, as follows: J. M. Padgett, Dr. H. H. Keith, Dr. F. H. Scholle, W. W. Mills, George W. Crane, F. M. Spencer and S. W. Lyman.

SPECIAL MODEL FOR MAIL SERVICE

Indianapolis Facilitates City Delivery by Employing Overland Vehicles—New Features in the Design.

The application of the automobile to facilitate the postal service has led several manufacturers to build motor mail wagons, which have been tried with various regrees of success. One of the latest designs of this type of vehicle has been brought out by the Overland Automobile Co. and has several new features. The two wagons shown in the accompanying illustrations were put into service in Indianapolis, Ind., during the past week and are being used to de-centralize the bulk ot the city's mail. Their value was felt at once, as it changed the delivery system materially and facilitated things from the start. Now, instead of returning to headquarters for each delivery, the carriers get their loads from branch stations and thereby save a great deal of time.

OVERLAND MAIL WAGONS IN USE AT INDIANAPOLIS

The two cars now in use have been leased to the Post Office authorities by the Overland company, which supplies the drivers and is responsible for the up-keep and repair of the machines. The bodies are mounted on regular 30 horsepower Overland chassis. They follow the general lines of limousine construction even to the glass wind shield in front of the driver.

The most novel feature of the design is in the arrangement of the seats for the driver and postal clerk. The wire netting which encloses the entire body is made to surround the two individual seats in such a way as to completely isolate the driver from the mail-carrying compartment, while affording the postal employe opportunity to keep the contents of the wagon continually under his eye. The general finish and painting of the vehicles is in accord with the standards applied to the horse-drawn vehicles in regular use by the department.

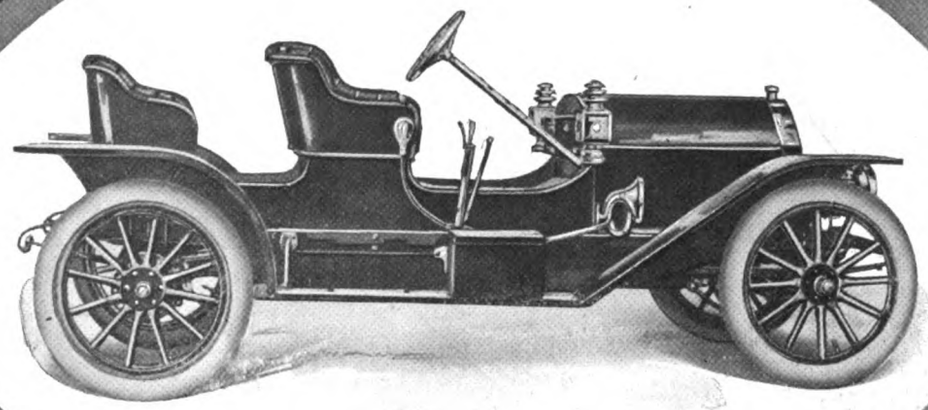
Incandescent Electric Lights in Garages.

The old question as to whether or not incandescent electric light bulbs are a menace to safety in garages, has been revived recently in Indianapolis, Ind. A week ago, the fire department was called out to attend to a blaze which started in the garage of the Indianapolis Motor Co., caused, it was asserted, by the breaking of an electric light bulb which was being used by mechanics working underneath a machine. When the break occurred, it was said, the car was immediately enveloped in flames, owing to the ignition of leaking gasolene. By quick work, the burning car was pushed out of the building into a heavy rainstorm, and the flames extinguished before much damage was done. When the firemen arrived, however, the majority of them refused to believe that the fire could have been caused in this way, contending that the breaking of the bulb would put out the light instantly and that ignition of the gasolene would be impossible. The garage people, however, declare that the extinguishing of the filament in the bulb is not absolutely instantaneous and that it would have sufficient time to ignite the vapor under such circumstances.

Small Cars Gain Favor in France.

Report has had it for some time that the popularity of the small car was increasing abroad, particularly in France, at a rate which was very remarkable in the light of the past favoritism of the large and luxurious machine. Recently the matter was put to the test by a Parisian journal which circularized all the principal provincial automobile agents in an effort to determine authoritatively what type of vehicle was in greatest demand. No less than 80 per cent. of the replies indicated a local preference for cars of from 8 to 10 horsepower and costing between $900 and $1,200.

ABOUT SETTING THE HEADLIGHTS



Drivers at Variance as to Best Way of Placing the Lamps—Advantages of Centralizing the Rays.

Some difference of opinion exists among motorists as to the proper method of setting the headlights of a car which is to be given any great amount of night work over rough roads. By some drivers it is held that the desirable thing is to place the lamps in such a way that the rays of light shall be thrown out in perfectly parallel and horizontal planes—the lamps themselves being adjusted with this in view by means of a plumb line, and a straight-edge laid across their lenses. Others hold that the light should be focussed on the road at a point not too far distant from the front of the car. To this end the lenses are sometimes placed so that the light is concentrated on a single point, while in others the rays from one of the headlights are directed forward and at only a very slight inclination below the horizontal plane, while those from the other are directed at the ground only a short distance from the front of the car. This "wall-eyed" arrangement is not ideal, however, as it sacrifices considerable of the illuminating value of one of the lamps. The centralizing arrangement, in which full advantage is taken of both beams, is considerably more advantageous even than that in which both beams are held perfectly parallel.

The Longest Automobile Freight Line.

What is claimed to be the longest automobile freight line in the country has been established between Croville and Brewster, in Okanogan county, Washington. The distance is 80 miles. Heretofore the line has been served by ordinary wagons, which took two days for the journey. The motor vehicles make the trip in eight hours.

THE INTER-STATE—MODEL 28
$1750.00

Announcement

THE INTER-STATE CARS

The coming of the INTER-STATE marks a new era in automobile history.

From every man and woman interested in automobiling, either as present owner or as a prospective purchaser, the INTER-STATE commands attention—

Because—

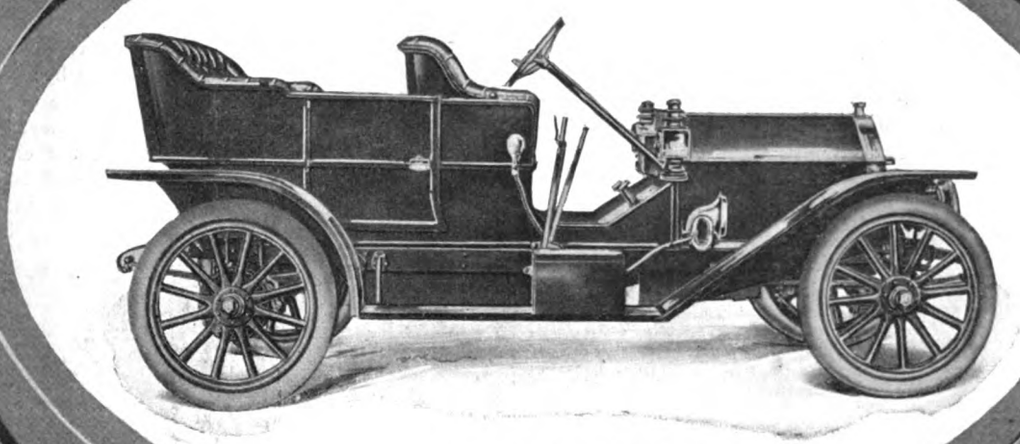
It belongs to the highest class of the 1909 Automobile; is a perfectly-made, light-running, easily-controlled, speedy, graceful, enduring car.

And is sold at a price—$1750.00 complete, including Eisman Magneto—but little higher than the price asked for the "good-enough-until-later" cars.

Of this latter type there are many. The market is flooded with their titles and book-pages are crowded with their claims.

Of the INTER-STATE type there is but one **at any where near its price.** And **IT** is the INTER-STATE.

Where is the economy or the automobile satisfaction in buying a car that you will probably discard next year for a **real** car? Would it not be actual economy and also "good business' to buy the **real** car, the **satisfying** car, the **lasting** car, **this** year—especially since you can buy this kind of a car for just a little more money than is asked for the **temporary** car?



If you want an automobile and do not feel like paying anywhere from twenty-five hundred to five thousand dollars—

Here is a car—the INTER-STATE—that will suit your price requirements and give you the quality you really want.

In style, comfort, speed, ease of control, and low cost of up-keep, the INTER-STATE finds its only competition in the high-grade, high-priced cars, all of which sell for far more money than the INTER-STATE.

The INTER-STATE AUTOMOBILE CO. is a new Company and the INTER-STATE is a new car. But the men behind them—Thomas F. Hart, F. C. Ball, J. M. Maring, G. A. Ball, T. F. Rose, and E. B. Ball—are men who represent millions in capital and an equal wealth of business honor.

Digitized by Google

THE INTER-STATE—MODEL 25
$1750.00

They are not the kind of men to trifle with the public or trade by false standards. They have built one of the greatest factories in the world, have installed the most modern machinery that money could buy, and have gathered under their management an ideal organization of automobile brains and skill, for just one purpose—to make this superb car that Claude E. Cox has designed, the INTER-STATE.

Why have they done this? Because they realized that the INTER-STATE would occupy a field absolutely distinct from that occupied by any other car, namely, **the highest type of an automobile from every point, at a low price.**

This is the car that we want you to see. We want you to drive it, and give it every possible test, before you **think** of spending your money for a cheaper car—or for even a higher-priced car. We will be content to accept your judgment as to its value at $1750.00.

It will be exhibited at Grand Central Palace, New York, December 31st to January 7th, and at the Coliseum, Chicago, February 6th to 13th.

Dealers and agents will quickly appreciate the opportunities open to them by the INTER-STATE. Our proposition is unusually attractive.

Write

D. W. HENRY, Sales Manager

Inter-State Automobile Co., 126 Willard Street, Muncie, Ind.

Specifications

FRAME—Pressed from cold rolled steel, special stock.
FRONT AXLE—"I" beam, drop forged in one piece—not welded—and double heat treated.
REAR AXLE—The reliable semi-floating type with large axle shafts and Hyatt Roller Bearings.
WHEELS—Artillery type, 12 spokes, 1½", 34" diameter.
TIRES—Standard Goodyear Quick Detachable, Continental or Diamond. 34x4".
BRAKES—Four 12" brakes all acting on rear hubs external and internal.
TRANSMISSION—Three speed selective type and reverse with vanadium steel gears. The selective mechanism built inside transmission case, thoroughly lubricated at all times.
HORSE POWER—34-40.
GEAR RATIO—3½ to 1, giving from 5 to 60 miles on high gear.
MOTOR—Four cylinder, 4¼x5, water cooled, cylinders cast in pairs.
CRANK SHAFT—Special drop forging, 35 to 40 carbon steel, double heat treated.
IGNITION—Double system Eisman Magneto, commutator, battery and quadruple coil.
BODY STYLES—Touring Car, Roadster, Tourabout and Demi-Tonneau.
WHEEL BASE—112"; TREAD—56½".
COLOR—Standard Inter-State red.
PRICE—With best of equipments, head lights and generator, side oil lamps, tail lamp, tube horn, tire repair kit and tools, Eisman magneto, F. O. B. Muncie, $1750.

MILITARY VALUE OF AUTOMOBILES

French War Official Declares Motor Vehicles Necessary in Army Operations—Adaptable Types Specified.

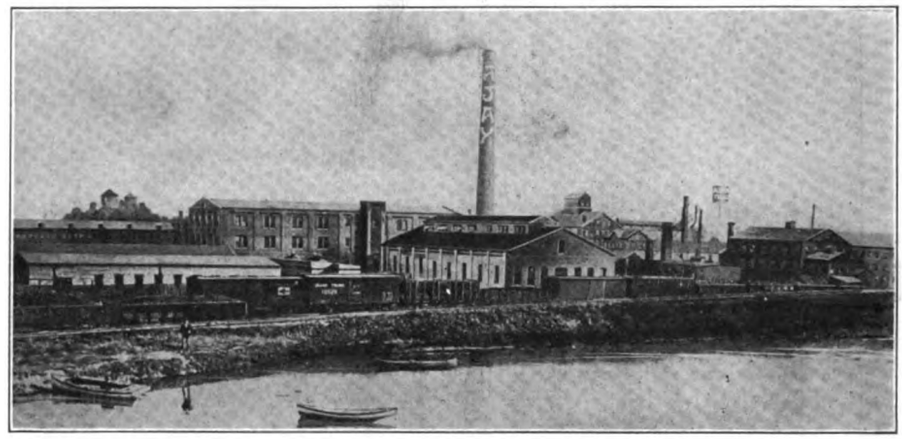
From the clumsy, armored motor vehicles destined to act as miniature moving batteries down to the ordinary pleasure car adapted to despatch duty, the war departments of Continental Europe have given the automobile a most thorough test during the past four or five years, as a result of which its status has been pretty clearly established and classified. In America the present impression among military authorities is that the sphere of the motor vehicle is more or less limited by its necessary confinement to roads of at least passable condition, as a result of which its usefulness must be confined to such movements as attend the mobilization of considerable numbers of troops, where there is opportunity to improve existing roads or to construct new ones where that may be necessary. Somewhat in the same line is the opinion of General Langlois, the French état-major, who has recently published two articles on the subject in the Temps of Paris.

"The most prominent of the applications of the motor vehicle in time of war," he concludes, "is for the organization of the service for the convoys of provisions. The growth of self-propelled traffic for private industries and the reduction in horse-drawn vehicles causes very urgent and special attention to be directed to this question of convoys, which no longer presents itself at the present day under the same conditions that were prevalent only ten years ago. It is further complicated by the enormous growth in the munitions and stores, which the conduct of modern warfare now entails. In these circumstances it is clearly established that both the railways and the horsed vehicles combined would be absolutely inadequate to provide for the provisioning and supply of stores needed by an army of the present day in the requisite time.

"It must be remembered that with an automotor it is possible to convey five times the weight that can be moved by means of horsed baggage carts (4,000 kilograms in lieu of 800), moreover the distance traversed by the motor each day is four times as great as that which can be covered by horses—namely, 120 kilometers in place of 30. From this it appears that by means of mechanical agency it becomes possible to accomplish twenty times the amount of work performed by animal traction. The length of the train of convoys is thus greatly reduced, the number of vehicles and of persons in charge is diminished, and the re-victualing is done with much greater rapidity. The experience gained in the course of the grand manoeuvres and the recent competitions for weight-carrying motors render it possible to formulate the conditions with which vehicles of this description employed for the victualing of an army must comply.

"Three different descriptions of motors are available and have been tried:

"1. Tractors. In this case a single motor-truck draws one or more trailers after it. The tractor alone provides for the requisite adhesion to the ground in order to propel the trailers attached to it. From this it results that it must be a very heavy vehicle, rapidly wearing on the roads, more especially at parts where there is a curve. This class of motor does not therefore find favor.



"2. Renard trains. The motive power produced in the leading car is mechanically transmitted to each of the trailers, which contributes therefore to the adhesion. The returns from this class of vehicle are high, the roads are not severely damaged, and there is little risk of wear and tear. This is, therefore, an excellent system for military convoy purposes; the only drawback is that it is impossible to divide up the train into units.

"3. Motor wagons. The vehicles tested were those of the usual commercial type; they gave very favorable results and proved themselves to be well adapted for army transport purposes. The trials showed that it is possible to arrange for weights up to eight tons without injury to the roads, the usual load carried being four tons. It appears, however, advisable to introduce the following improvements: The use of a more simple and stoutly constructed motor engine, automatic carburation, and arrangements for facilitating the adoption of various kinds of fuel. The starting gear should be automatic.

"In order to obtain the best results it was ascertained that the speed should be moderate, not exceeding 12 or 15 kilometers per hour; there is otherwise a risk of damage both to roads and vehicles.

"As it would obviously be impossible to create a special equipment of automobiles for army transport purposes, since it is not improbable that such stock would have become antiquated before the time for the use of it arose, it appears necessary to rely upon private motors, which during war time could be impressed for military service. In order to stimulate progress in mechanical systems of locomotion and to render these systems adequate to provide such assistance to the military authorities as they may require when occasion arises."

General Langlois calls on the Minister of War to give a vigorous impulse to this branch of industry by the offer of adequate rewards in the shape of premiums. He insists, also, on the need of further experiments respecting the employment of alcohol for internal combustion engines, since the supply of petrol, as it is an imported article, might suddenly be cut off in time of war. The general likewise discusses another military use for motor vehicles, at present employed for commercial purposes, namely, in order to convey rapidly from one point to another of the battlefield large bodies of troops. It might be possible by this means to render important service to a commander by increasing to a very remarkable extent the mobility of his forces, he suggests.

AJAX-GRIEB FACTORY, TRENTON, N. J.

Ajax-Grieb's Enlarged Factory.

Though but two years old, the Ajax-Grieb Rubber Co. has risen to a position of some little prominence in the industry as a result of which it assumed the dignity of a new and enlarged factory in Trenton, N. J., early in the summer, which has been completed but a short time. As the picture shows, it is conveniently located with regard to transportation and the other necessary manufacturing facilities and is of ample floor area to take care of an enormous amount of business. Formed in 1906 by a number of automobile manufacturers, among whom the Ford Motor Co. and the Maxwell-Briscoe Motor Co., were most prominently associated, its growth has been gradual but insistant. Among its most boasted recent achievements was the signing of a contract for delivery of no less than 29,000 complete tires—said to be the largest single tire order ever given to a tire manufacturer.

SLUGGING SPICES TAXICAB STRIKE

Odd Features of Drivers' Merry War on Strike Breakers—Photo of a Feast Serves as a Detective.

Jolting along in a jinricksha on Broadway, a timid lady of the stage announced to her friends that she was forced to that means of conveyance by the taxicab strike which was raging in New York City. Of course it was purely a press agent's "plant," the papers all being provided with photographs and interviews, but it made a hit because of the news prominence the strike was attracting, both on account of the inconvenience it entailed on the public and because of the incidents of violence attending it. The public history of the difficulty and of the events attending it has been spread large, but there is a wealth of "inside" history which has not been disclosed, particularly as to the manner in which the strike was broken and the acts of violence of the strikers discouraged.

Officially the period of the strike against the New York Taxicab Co. by the drivers of the machines, was from October 3 to November 13, though in reality it tapered outside these dates. Dynamite bombs, murders, incendiary fires, riots, black-jacking and other equally mild measures of suasion were used by the strikers to bring the company to their views, and the newspapers were kept busy telling how cabs were being wrecked or taken from their drivers and stolen, while unfortunate strike-breakers were being slugged or assassinated.

Strangely enough little publicity leaked out as to some of the things which happened to the strikers themselves and their sympathizers. Nevertheless a census of the broken heads and pounded bodies which they had occasion to go home and nurse would probably make the record of injuries to strike-breaking drivers look modest and trifling by comparison. A more quiet and efficient warfare against strike violence could hardly be conceived, and warfare it really was in the literal sense of fight and battle.

When things began to get warm for the Taxicab company, an experienced strike-breaker was engaged, who in addition to knowing where to get men capable of running the cabs was likewise able to organize a gang of "sluggers" and fighting men of the kind who relish a bloody "scrap" more than a wildcat does raw meat, and who regard being paid to fight as the softest "graft" possible, except that it imposes limitations as to whom and under what circumstances they may let loose, thus calling for some restraint. Not bound by any sympathies with the strikers or their friends, they found rich material to work on. If there were "huskies" and "scrappers" among the strike crowds, the experienced and eager Taxicab "sluggers" were aching to "eat 'em up," and the quickness and dispatch with which they did so when they got a chance was marvelous to behold. Furthermore, as if to add insult to injury, after pounding a strike rioter to within an inch of his life, the Taxicab men would in many cases drag their prey to police headquarters and have him arrested.

While the police department was in duty bound to afford the Taxicab company some measure of protection against the attacks of the strikers, the approach of the November election was observed to have a visible effect in relaxing the police activity against them, due in some degree to the fact that the strikers were backed by the Liberty Dawn Association and its friends. Through the mysterious intricacies of politics many of the police department officials were impressed with the desirability of not being too hard on the "boys" who were "doing things" to the cab company and its employes. Police Commissioner Bingham had to discipline several desk officers for not providing men where obviously they were needed, so that the cab company was in a large part thrown on its own resources and found its fighting force a very real necessity.

The Liberty Dawn Association, be it known, is an organization of horse-cab drivers, formed to insure a favorable arrangement with the Livery Stable Keepers' Association from whom the cabs are hired. The members are chiefly the typical New York "cabbies," many of whom have both a strong arm and a strong pull. When the New York Taxicab Co. began to get large numbers of its machines on the streets, the drivers' ranks were extensively recruited from the Liberty Dawners, it being thought that the knowledge which the experienced cabmen had of New York's topography and the like, would be valuable in the new service. The Taxicab company instituted a school of instruction for them, and before long there were many ex-reinholders at the steering wheel. When their number grew proportionately large, they began to figure about applying such Liberty Dawn methods to the Taxicab company as had been successful with the livery keepers, and they commenced steps to that end.

When the Taxicab company saw the trend of things, it hastened to counteract the tendency by suggesting to the men the formation of a taxicab drivers' association, quite independent of the Liberty Dawn Association or any other established organization. To lead the new movement some of the oldest and most loyal of the company's drivers were picked out. As a step in expediting the plan, a dinner to the drivers was programmed, based on the first anniversary of the company's business, or something of the kind, and all the drivers who could be spared were invited to attend. At this affair gold watches and congratulations were expended on those of the drivers who had been with the company practically from the start and who were not Liberty Dawners. Among the felicities of the occasion was the taking of a large flashlight photograph of all the diners at the banquet, which played an important part in a subsequent chapter.

Meanwhile the Liberty Dawn movement was coming to a rapid head, hastened by the fact that while the drivers who had been with the company for some time were making "easy money" on the commission basis, sometimes estimated as high as $50 or $60 per week on the best paying stands, the newcomers were scratching out barely enough to live on, through being placed only as substitutes in the absence of regular drivers or because of having to take the stands where the calls were few and far between, and the tips the poorest. The effect of this difference in earnings was to divide the sentiment about equally when it came to a proposition of demanding a straight wage rate of $2.50 per day instead of the commission compensation of 20 per cent. of the earnings, less the cost of fuel, oil and uniforms. When at one of the drivers' meetings a vote was taken whether to strike if the company would not sanction the change, the ballots for and against were about equal, due to the fact that the number above and below this figure in earnings were in balance.

Because of he company's apparent hostility to any organization other than one fathered by itself, however, many of the drivers, particularly those whose earnings were average or indifferent, leaned toward the new movement, and when recognition was denied the Liberty Dawn crowd as a union thy joined the strike.

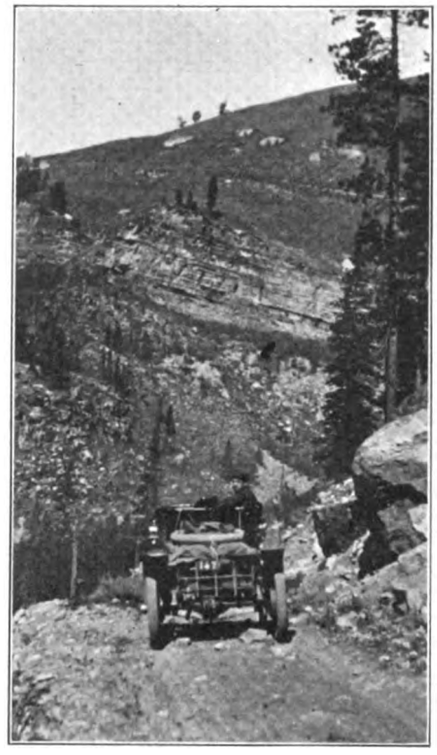
Immediately the men walked out, the company's troubles began. The men who stuck were attacked with bricks and clubs when they appeared on the streets with the red "taxi-s." As the fight grew more protracted and bitter, the methods employed by the strikers became more and more dangerous. Taxicabs were engaged to take prosperous looking passengers to uptown streets in lonely districts, where the driver would suddenly be set upon by an organized gang and the cab destroyed. The passenger, in such instances, was simply a strikers' decoy. A fashionably dressed woman after engaging a cab for a short trip, would dismiss it, and shortly afterward the vehicle would either blow up from some explosive left in it or would be found to be burning vigorously inside, the lady having prepared a neat little package of inflammability, which she set going when he got out.

To intimidate the public and to make the hotels "shoo" the cabs away from their regular stands, carefully aimed rocks and brickbats just missed the vehicles and went crashing through the large plate glass windows of the ground floor restaurants of the hostelries, scaring the guests and creating great alarm generally. Most of the hotels, however, were willing to see the company through the difficulty, and only a few

Digitized by Google

took steps to have the cabs kept away while the strike was on.

Among the more prominent incidents was the waylaying of a driver by a gang which beat him up and then ran the cab through a cross street to the river, where it was driven over the dock into the water. It has not heretofore been disclosed, however, that instead of the gang then following the ambulance containing the driver to the very gates of Bellevue hospital and threatening him further, its members found themselves busy "mixing things" with a squad from the Taxicab office, who, after laying most of them out on the pavement with various accumulations of closed eyes, unattached teeth and fractured skulls, rescued the cab from its watery berth and hauled it back in triumph.



If the strikers could use the "glad rag front" as a decoy, so could the company, and on several occasions a lone chauffeur of a red "taxi" conveying two or three apparently innocuous youths in evening clothes, upon being attacked would have the pleasure of seeing his passengers jump out and "clean up" the attacking party, slamming them right and left and only stopping short of murder. If any of the attackers had a kick left in him after the melee, he was turned over to the police, while the rest were left for the hospital corps.

Old drivers, who staid with the company when the strike was declared, were in many cases able to name the leaders in the gangs that set upon them, but the new recruits did not know the strikers by name. Then the photograph—the flashlight of the harmony banquet—was brought out, and from the array of faces at the festal board the strike rioters were frequently identified. They were given a few friendly attentions by detachments from the Taxicab camp, when favorable opportunity presented.

But the enthusiasm of the company's corps of riot pacificators, so steadily thinned the ranks of the strikers able to report for participation in the attacks, that these events grew less and less frequent although their character did not diminish in vigor or ingenuity until the very end. After a few truces and several endings of the strike, following which trouble broke out anew, the fight gradually languished on the part of the aggressors, until it became quite safe either to hire or drive one of the little red cabs. The public impression was that the violent methods of the strikers had been met by the company in a spirit of calm and law-abiding defense, depending upon the established machinery of peace and order. As a matter of fact the company fought fire with fire, and looked to the police for no more than it could get. If broken ribs and broken heads could weaken the strike-breakers they were equally valuable in weakening the strikers, and New York City was consequently made the battle ground for a reciprocal warfare in which the "scrapper" could indulge himself to his heart's content, no matter with which side he cast his fortunes. Now that it is over, many of the "regulars" that were under the Taxicab banner will have to do their fighting simply as a diversion, without pay, while the "volunteers" of the Liberty Dawn camp are already used to fighting without pay, anyway, and enjoy it.

Where Snow Forbids Motoring.

While modern motor cars are capable of getting almost anywhere and can overcome nearly every sort of road condition good or bad, plow through hub-deep mud or heavy sand and surmount the steepest hills, never-

theless one condition frequently proves an insurmountable stumbling block to its progress, and that is snow, driven and drifted. This was proved to the satisfaction, or rather, dissatisfaction of Dr. O. T. Parker and several of his friends recently when they undertook the passage of Eagle Canon, Colorado, in the course of a hunting trip.

The party which set out through the mountains in a Franklin car, encountered some terribly bad roads and awful ascents, as may be judged from the accompanying picture, showing the car in the act of descending into the canon itself. The general was covered most successfully until snow began to fall in the canon. When it snows in that part of the country it snows well and the storm soon piled up the drifts so high that it was impossible for the car to proceed. To save their lives the half frozen party had to abandon the car and their entire camping equipment, together with their guns and 18 deer that had been bagged, and make their way out on foot. After finding shelter some miles distant, they were obliged to wait ten days before it was possible to set out with a rescuing party to release the car and its load.

Planning Law to Check "Borrowing" Cars.

Minneapolis, Minn., is having trouble with motor car "jokers" and has been moved to the point where it has seen fit to draw up a bill to be introduced in the State legislature. Of late, numerous motor car owners, leaving their machines standing at a curb, have had their property "borrowed" without permission being granted for the loan. The borrowers in most cases have not been regular thieves, but mere sportively inclined young persons desiring to play a prank. Some of them have carried their jokes too far, however—far enough outside the city limits to spoil the owners' sense of humor. One bright youth recently made off with an expensive touring car and then stranded it on a country road, where it was found damaged to the extent of nearly $1,000.

It seems that there is neither a city ordinance in Minneapolis, nor Minnesota State law covering this particular offense. In cases where arrests have been made, judges have ruled that no theft was intended and that it was just a joyous "lark." The members of the Minnesota State Automobile Association declare that if they cannot get a State law, they will have the city council act.

Vincennes Automobilists Form a Club.

After a few preliminary meetings the Vincennes Automobile Club has been formed in Vincennes, Ind., its expressed purposes including a furtherance of the good road movement and the suppressing of the "inconsiderate" driver. The following officer was elected: R. W. Gibson, president; H. T. Johnson, secretary; W. C. Bierhaus, treasurer; Perry Tindolph, first vice-president; G. A. Pielemeier, second vice-president; Dr. C. W. Denham, A. M. Shepard and Bert C. Fuller, directors.

Big Registration in Ohio.

In the November report filed with Secretary of State Thompson, Fred C. Staley, Ohio registrar of automobiles, shows that since the motor vehicle law became effective in that State on June 10, 1908, the total revenues for registration tags up to the end of the fiscal year, November 15, amounts to $56,102 . The receipts for the month of October and the first fifteen days of November came to $1,677.50.

Motor Car Touring Society Election.

An election of officers of the Motor Car Touring Society, the New York amateur club, took place on Wednesday, 2d inst., and the following officers were chosen for the ensuing year: President, Albert Eugene Gallatin; second vice-president, Percy R. Pyne, 2d; secretary and treasurer, Orme Wilson, Jr. These, with Marshall Kernochan and Stuyvesant Fish, Jr., will form the governing committee.

DIFFICULTIES OF MOTOR RATING

Foreign Experts Involved in Discussion of Determining Factors—Ratio of Dimensions an Elusive Quantity.

As a result of the appointment of a commission to investigate and report upon the subject of horsepower rating for motor vehicles, as recently told in these columns, members of the British Society of Motor Manufacturers and Traders, the Royal Automobile Club and the Institute of Automobile Engineers, which form that body have been plunged into a depth of technical discussion more searching than ever the subject has been granted before, and one which promises much entertainment for those who are able to follow at all closely the finer points of theory which must be taken into account. Up to this time the deliberations of the commission have gone no further than a discussion of the present R. A. C. formula and the proposed formula of the S. M. M. T., an explanation of which appeared in the Motor World's issue of September 17th.

In a word, the latter expression is calculated to take into account variations in the probable power of motors due to the ratio of bore to stroke and also to the variations in stroke when the bore is constant—both of which factors are unaccounted for in the common formula which is known in this country as the accepted rating of the Association of Licensed Automobile Manufaturers. The proposed S. M. M. T. formula is:

horsepower $= k \times d\ (d - 1)\ (r + 2)\ n$

where k is a constant, depending on the type of motor under discussion and is given the value of 0.197 for touring cars, and 0.333 for racing cars. The terms d, r, and n, are, respectively, the diameter of the cylinders, the ratio of stroke to bore, and the number of cylinders employed.

In the criticism of this offered by G. H. Baillie at one of the meetings of the commission it was pointed out that the desirable formula should serve at least two ideal purposes: (1) "To enable anyone to ascertain the horsepower of an ordinary car engine from its dimensions," that is to say, to serve the purposes of a "nominal horsepower formula"; and (2) "to afford a basis upon which engines can enter for competitions," thus making a "competition horsepower formula."

"A nominal horsepower formula," he said, "has merely to take into account what is done with an engine in current practice, while a competition horsepower formula has to take into account what can be done with an engine if it be built specially to suit the formula.

"In an engine for touring cars merit is not measured by horsepower alone. Consequently it does not matter what dimensions are used in the formula, whether bore or stroke or cylinder capacity, or any of them to any power, so long as the formula does give the horsepower with fair accuracy in most cases.

"On the other hand, in competitions such as races or hill climbs, horsepower may for present purposes be said to be the one and only thing to be considered. Engines built with this end in view are liable to become 'freak' engines, and it seems to be the general opinion that a competition horsepower formula should not encourage freak designs. . . . .

"There has been apparently much difference of opinion between really competent people on the question of formulæ, but I believe that most of what seems to be difference of opinion is really difference of definition. I will, therefore, baptize the different kinds of formulæ I shall speak about to ensure the same thing being called by the same name in this discussion.

"Horsepower Formula—A formula of any kind which purports to give the horsepower, either indicated or brake, either maximum or at any particular speed, of a petrol engine.

"Nominal Horsepower Formula—A formula which purports to give the maximum brake horsepower of a petrol engine from any data which are easily ascertainable without testing the engine.

"Competition Horsepower Formula—A nominal horsepower formula with such data as to discourage freak designs as far as our present knowledge goes.

"As an example of the requirements of the two kinds of formulæ, the nominal horsepower formula and the competition horsepower formula, I will take the factor of stroke, as this is the main bone of contention in all formulæ discussions. It is the omission of stroke that has brought so much abuse on the D^2n formula, and it is stroke which is the new factor introduced into the proposed S. M. M. T. formula.

"There is, of course, no question that the horsepower of an engine can be greatly increased by increasing the stroke or the ratio of stroke to bore, and a competition horsepower formula must therefore take this factor into account. So much for the effect that increase of stroke can have. Now the question is, what effect does it have in actual practice in touring car engines?

"The evidence I have been able to collect shows that the horsepower does not increase with increase of the ratio, but rather tends to decrease. And, in fact, it is not difficult to see the reason why the horsepower does not increase. The evidence I refer to is the exhaustive series of tests made by the Automobile Club of France on the maximum horsepower of 96 engines in November, 1906. I referred to these tests in a paper I read before the R. A. C. early this year, and showed curves between the horsepower and the ratio of stroke to bore for all these engines. Those curves show that, with very few exceptions, the horsepower increases as the ratio decreases. At any rate, down to a ratio of 1 or 0.9.

"In default of any later evidence of actual practice, I think it may be concluded that for ordinary touring car engines a nominal horsepower formula is more accurate if the ratio of stroke to bore be omitted. At the same time it is even more certain that in a competition horsepower formula it should be included, and, I think, given more weight than in the proposed S. M. M. T. formula.

"The S. M. M. T. report gives the list of factors which a 'completely satisfactory formula' should take into account. These are:

"(1) The effect of multiplying the cylinders.

"(2) The effect of size of cylinder upon the 'mean pressure equivalents to the brake horsepower.'

"(3) The dependence of the maximum piston speed practically attainable upon the ratio of stroke to bore.

"(4) The effect on mean pressure of varying compression ratio.

"(5) The effect on mean pressure and engine speed of the nature and mode of ignition adopted.

"It seems to me that this by no means completes the list for so high an ideal as a 'completely satisfactory formula.' . . . . Other factors which have a material effect on the horsepower are, for instance, the size of the valves, the steepness of the cams, the weight of the reciprocating parts, the size and shape of the induction and exhaust pipes.

"It is, though, obviously impossible to include all the factors, or even the important ones, in one formula, or, indeed, to ascertain them, and it seems, therefore, impossible to obtain a completely satisfactory competition horsepower formula, or anything like it.

"In considering a nominal horsepower formula for touring cars, the case is entirely different. The basis of such a formula is not what can be done with an engine, but what is done. The discovery of the best formula presents no difficulty; it only requires that British makers in 1909 should afford the same facilities as were willingly afforded by the French manufacturers in 1906. Curves can be drawn representing the average variation of horsepower with these factors, and a formula can then be obtained which fits the curves as closely as may be desired.

"One factor to which a large portion of the S. M. M. T. report is devoted is the variation of piston speed for maximum horsepower with r, the ratio of stroke to bore, and an equation representing this formula is deduced from theoretical considerations, and subsequently serves as basis or part basis for the proposed formula. The figures obtained by the French Club enable this equation to be checked, and show that piston speed does not vary with r according to any really regular law. What little regularity there is shows a variation in the

Digitized by Google

opposite sense to the theoretical variation given by the equation. . . . .

"The horsepowers adjusted according to the S. M. M. T. proposed formula vary far more than when not adjusted for the ratio, and the formula curve does not represent them particularly well. The average percentage error of 61 engines between bores of 80 and 130 mm. is with the proposed S. M. M. T. formula 13.1 per cent., while with the formula with bore only, the average error is only 10.3 per cent. The presence of the (r + 2) term in the proposed formula of the S. M. M. T. is chiefly responsible for its greatest errors.

"This is sufficient to show that, given the experimental data, it is easy to deduce a simple horsepower formula giving the horsepower of touring car engines, and if only people would come forward to facilitate the work of collecting the data we should require no more discussions or theories, but should have a formula that was without question the best possible at that time."

Baillie concludes with this suggestion to the commission: "That a small committee, independent of all trade influences, such as could be formed from the Technical Committee of the R. A. C., should prescribe conditions for testing the normal maximum horsepower of an engine, and that the different makers should supply the results of their tests on new types or sizes of engines put on the market. The results would have to be treated as confidential by the committee, otherwise it might be difficult to ensure getting the figures of normal engines. The committee might then, at the beginning of each year, issue a nominal horsepower formula, based on these results.

"For competitions it is impossible to devise a 'completely satisfactory formula,' on the lines indicated in the S. M. M. T. report, and I think that if any formula be advised for competitions, it should be put forward with a clear statement of the limitations it must necessarily have. After all, the excellence of a formula for competitions should be judged not for its scientific correctness, or, indeed, by the accuracy with which it gives horsepower, but only by the degree of interest and usefulness it lends to the competitions."

Mervyn O'Gorman, whose prestige in British motoring circles is unquestioned is able to discern no less than four distinct purposes for the ideal formula, thereby adding more to the uses of the much desired expression.

The first of these is the "Olympia formula," which he described as a "wrinkle or 'tip' for a layman. It may be called a rating, omitting the word horsepower altogether," he thinks. Second, there is the requirement of the engineer of an accurate method of power determination, which is satisfied by the familiar "P. L. A. N." expression which is common to all types of engine. For competition two sorts of formula are required—one for such competitions as are organized on short notice and among entrants driving cars already constructed and of known characteristics—such for instance, as the stock car events carried out by individual clubs—and another for competitions requiring a carefully safe-guarded formula.

After proving by the aid of diagrams that the errors introduced by the "d-square" method of rating employed by the automobile club, when applied to engines of 1906 and 1907 construction were less "than the irregularity introduced by the various arrangements of inlet pipes, valves and carburetters," he suggests that in view of the apparent futility of attempting to arrive at a satisfactory basis of general rating, it would be better for a year or two to print and circulate a set of tables and curves for the purpose of ready calculation of the absolute power of each and every motor considered.

For competitions, he points out that there is no real need for an even approximate determination of the horsepower; all that is required being to provide a common method of handicapping. In fact, he even expresses the opinion that if the seal of approval were placed upon any single formula for competition, a source of much valuable information would be lost in the case of hill-climbing contests, for example, where conditions vary to such a degree that the rating of the power of the machine alone, can be of but small relative value.

The report of the rating committee of the Institute of Automobile Engineers upon the subject proved to be hardly more encouraging as regards the probable acceptance of the proposed formula or indeed, an early settlement of the rating question on this or any other basis. The chief point of criticism against the S. M. M. T. report was that the tests quoted were insufficient to warrant the assumptions made in the formula, it even being shown that in some instances the results given by the tests actually appeared to go contrary to the theories upon which the formula was based. The most salient proposal of the report is that a special committee be formed to discuss the exact nature of the tests to be made in order to supply data for accurate comparison by formula.

New Rectifier for Alternating Current.

A new form of alternating current rectifier has recently been brought out, according to the Scientific American, which is wholy mechanical in its operation. It consists of a cylinder of insulating material, provided with a pair of metallic contact points. Mounted on a ring which surrounds the cylinder are two pairs of contact points and there are in addition four rectifying discs of carbon which with the cylinder are rotated by a motor. By means of a pair of condensers, sparks are made to leap between the points on the rotating cylinder and first one and then the other pair of contact points. The current flows across the gaps between the points and the rectifying discs when the resistance is broken down by the spark, and is conducted to the storage battery intermittently, but always in the same direction. The rings on which the four points are carried may be revolved about its axis, so that the condenser will discharge at any point of the wave, and thus the voltage of the rectified current may be regulated.

Correctness of Odometer Readings.

There is a common belief among motorists that the reading of the odometer attachments to speed indicators, as well as the readings of the speedometers themselves are considerably affected by variations in wheel diameter, such as may arise from altering the brand of tire, assuming or rejecting non-skids, or from variations in inflation pressures. As a matter of fact, however, such differences amount to very little where relatively short distances are considered. Thus a well known maker of speed indicating devices is responsible for the statement that such variations are responsible for inaccuracies of less than 100 feet per mile. Calculation shows that for a difference in diameter of half an inch, the error should amount to not more than 80 feet to the mile for a 34-inch tire, which substantiates the above statement.

Paying for Gasolene with Lead Slugs.

Slot machines for selling gasolene are not as popular as they were with garage proprietors in Chippewa Falls, Wis., because the machines having been yielding fuel in response to lead slugs just as willingly as for good money. Quite a local scandal and sensation has been brought about by the discovery that a well known business man has kept his car supplied all summer by feeding the slot machines with worthless slugs shaped like silver dollars, and the garage people controlling the machines threatened grave legal proceedings unless a settlement were made.

Taximeter Cabs Predominate in London.

First rank has been given to taximeter cabs in London's time honored system of calling vehicles by means of whistles. In the past it has been customary to summon taxicabs by means of three blasts on the whistle, but the machines have gained such a popularity and the whistling for them has become such a nuisance, especially in the quiet streets at night, that the Home Secretary has ruled that hereafter they shall be called by only one blast of the whistle, while two blasts will be for a horse drawn hansom and three will be for a four-wheeler.

Carborundum for Grinding in Valves.

Carborundum is recommended as a substitute for the ordinary grades of emery for use in grinding the valves of the motor. It cuts quickly, leaves no scratches, and produces a surface which in smoothness and uniformity is hard to equal in any other way, it is said.

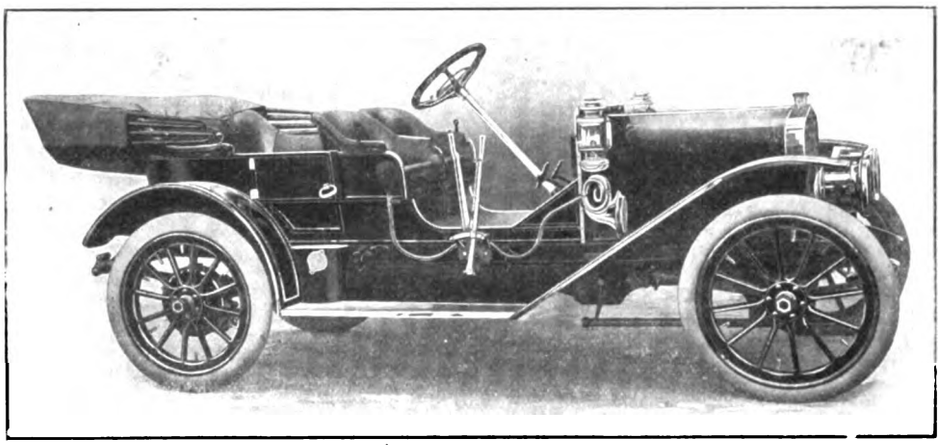
CHANGES IN CORBIN 1909 MODELS

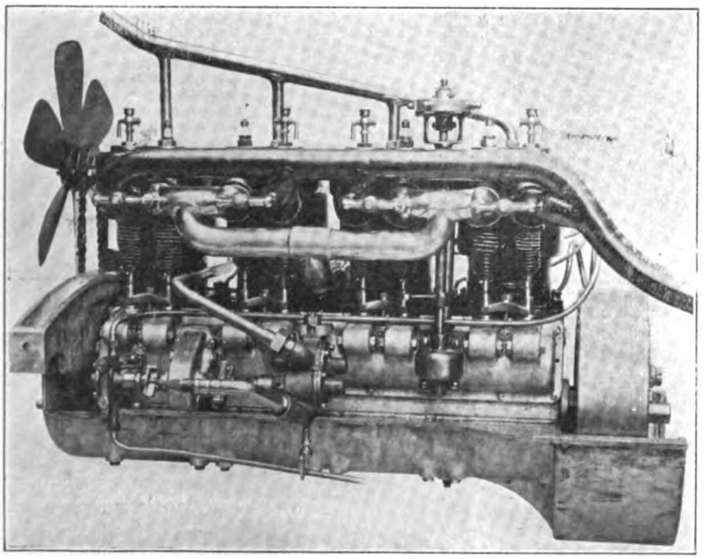


Only Minor Modifications Appear in the Line for Next Season—Various Applications of Body Design.

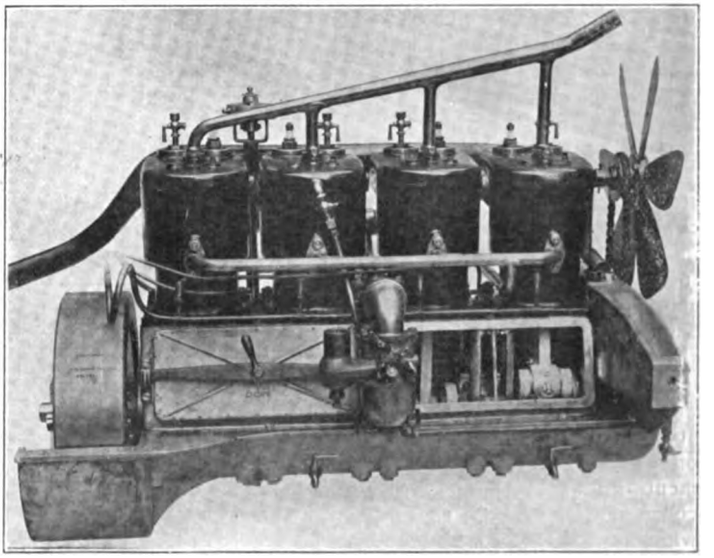
Specifications of the new models of the Corbin car, just announced by the Corbin Motor Vehicle Corporation, New Britain, Conn., reveal a line comprising various applications of body design in current styles to practically the same chassis construction. This is the same as has been employed during the current year in all salient particulars, but reveals differences in a number of minor points, most of these changes being rather more in the matter of dimension than in any other respect.

A brief review of these alterations shows that the motor is the same as the water-cooled type employed during 1908 except that the cam shaft gears have been given an improved housing and the oiling system also has been improved. In the matter of clutch construction the leather faced type of cone member with sub-facing relieving springs is retained. The clutch shaft and transmission shaft directly behind it are connected by means of an oldham coupling, the joint being enclosed in a dust proof casing, which serves the double purpose of protecting the internal parts from the effects of dust and dirt and also of preventing the central and floating member of the clutch from dropping out in the event of a loss of end adjustment between the two shafts. The leverage for operating the clutch is now so designed that a five-pound pull on the pedal is sufficient for declutching. The same principle applied to the re-design of the companion brake pedal permits the locking of the rear wheels with only a slight pressure upon the pedal. A new type of propeller shaft with fully enclosed joints also has been developed, the construction of the housings over the articulations being such as to protect the enclosed parts from dirt without in the least interfering with their action.

In the design of the front axle a new type of pivot bearing has been adopted, which incorporates very large balls working about a 2-inch circle. The front connecting rod of the steering system is now placed back of the axle, while a new design has also been adopted for the steering rod itself which is made from a single piece of cold drawn seamless steel tubing. In connection with the control of the vehicle, the installation of a new foot accelerator in addition to the hand lever mounted on the steering wheel, will be appreciated by the user. The braking equipment remains the same as before in principle, but the emergency brake drums are now placed inside of the foot brake drums, They are of the double-acting, contracting band type, while the emergency brakes are of the expanding pattern.



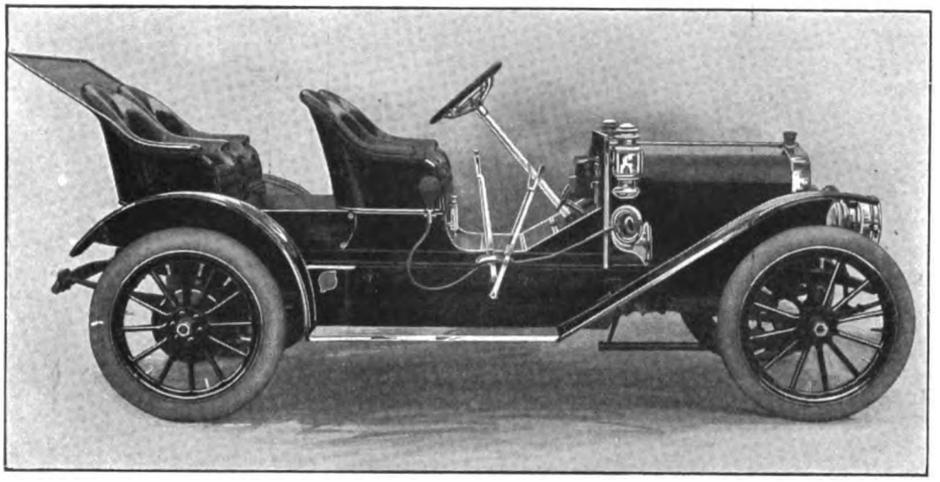
The frame has been reinforced to make it better able to withstand the stresses of heavy road useage. The fenders are similar to those used on the touring car of last year, the edges of the guards being stiffened with drip ribbons. On all models the spaces between the guards and running boards are fully enclosed by a guard fitted over the front spring eye of the rear spring. The radiator now employed affords practically the same cooling effect as the previous form. Though it has a larger area of face, the water capacity has been decreased.



CORBIN BABY TONNEAU, MODEL O²

Body options present three different offerings in the shape of touring car, runabout and baby tonneau designs. The tonneau of the touring body is now made 5 inches wider than heretofore, affording ample room for three persons on the rear seat. The runabout, as formerly, is adaptable to the uses of two, three or four passengers, and is of the same delineation as that used during 1908. The baby tonneau is a light, racy, four passenger car having the same general equipment as the regular touring car.

The general specifications of the chassis call for a quadruple, vertical motor of 30



CORBIN MOTOR, LEFT SIDE

CORBIN MOTOR, RIGHT SIDE

Digitized by Google

nominal horsepower, having a bore and stroke of 4½ by 4¼ inches. The change gear is of the selective type, affording three forward changes of speed. The rear axle is of the semi-floating type, equipped with spur differential gears. The frame is of pressed steel, channel section, with a pressed steel under-pan supporting motor and transmission. The springs are semi-elliptical, 40 by 2 inches in front and 50 by 2½ inches in the rear. The wheel base is 108 inches and the tread 56 inches.

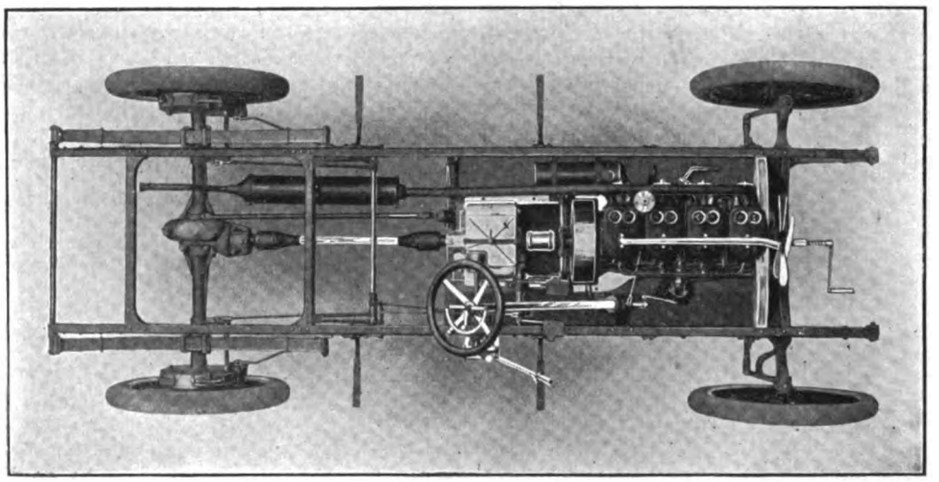
CORBIN RUNABOUT, MODEL O²

Special points to be noted in the construction of the motor are the neat and clean arrangement of the valves and auxiliaries on the left hand side—the commutator, for instance, being located above the level of the cylinder heads in a perfectly accessible position. The interior of the crank case is readily accessible from the right side through the use of a pair of large cover plates which, instead of being bolted in place, are secured by means of a couple of yokes and tension screws, and are so arranged that the adjustment of the "big ends" may be made without exposing the entire length of the crank shaft. The cam housing, it will be observed, carries intermediate levers between the cam faces and the tappets, whereby the action of the gear is "sweetened" and silenced considerably and the danger of wear not a little reduced.

The copper tube inlet manifold and the steel exhaust connections are purposely located with a good elevation above the base in order to provide ample access to the cylinders for the removal of the valves. The spark plugs are located over the inlet valves. The carburetter, which is located on the right hand side of the motor, with intake lead passing between the two cylinder groups is provided with ample water jacketing area. It is the only auxiliary placed on the right side of the motor, the arrangement affording plenty of room for the large cover plates to the case, already noted, which are absolutely unencumbered by the surrounding mechanism.

Another noteworthy point is in the arrangement of the motor suspension. The lower section of the crank case, which forms the continuous bed for the support of engine and transmission parts, is formed at the forward end with a pair of heavily ribbed cross arms, which extend to the sides of the main frame and afford the front support for the power plant. In the rear it is shaped into a semi-housing for the fly wheel, and is extended rearwardly to join the gear case construction in a rigid connection.

Royal Makes Changes in Models.



Changes over former models of the Royal are being made in the 1909 product, which the Royal Tourist Car Co., of Cleveland, O., designates as the Model "M" and which shaft. As an extra equipment a self-starting device will also be supplied.

Trade Name Restrictions in Hongkong.

Restrictions on trade names are imposed in Hongkong, and the registration of a company title will not be permitted, according to Vice-Consul-General S. J. Fuller, if it include the word "Empire," or "Imperial" in such a way as to convey the impression of government support or connection. "The title would not be allowed," he explains, "in connection with schemes for the acquisition or holding of lands, or exploration of new countries or territories, nor to companies formed for the purpose of supplying articles usually employed or dealt with by the state or by some public authority, e. g., ships of war, armaments, explosives, telegraphs, etc.; nor in the case of schemes to be carried out in India. On the other hand, no objection would be raised to such titles as the 'Imperial Tire and Rubber Company,' 'Imperial Electric Supply Company,' or 'Imperial Auto-Car Manufacturing Company,' unless there was reason to suspect that the company was not intended to carry on a legitimate business."

Maxwell-Briscoe Building an Addition.

Continued expansion of the Maxwell-Briscoe Motor Co.'s Tarrytown (N. Y.) plant has resulted in the erection of a new building, work upon which has already commenced, in which will be housed a fully equipped technical laboratory. While the purpose of the automobile plant is sufficiently exacting to require the services of a well stocked laboratory for the testing of materials of construction alone, the new department will be devoted largely to the carrying out of researches in the use of various fuels. Already the name Maxwell has been associated with numerous experiments in this direction, but the work has now progressed to a point where it is deemed expedient to provide special quarters where the investigations may be carried further.

CORBIN CHASSIS, VIEWED FROM ABOVE

the reorganized company is planning to have ready in the very near future. The motor is larger than ever before, being 5½ by 6 inches and developing 65 horsepower. A four speed selective transmission is used and the wheel base has been lengthened. Three sets of brakes are equipped, consisting of two sets applied to drums on the rear wheels and a third operating on the drive

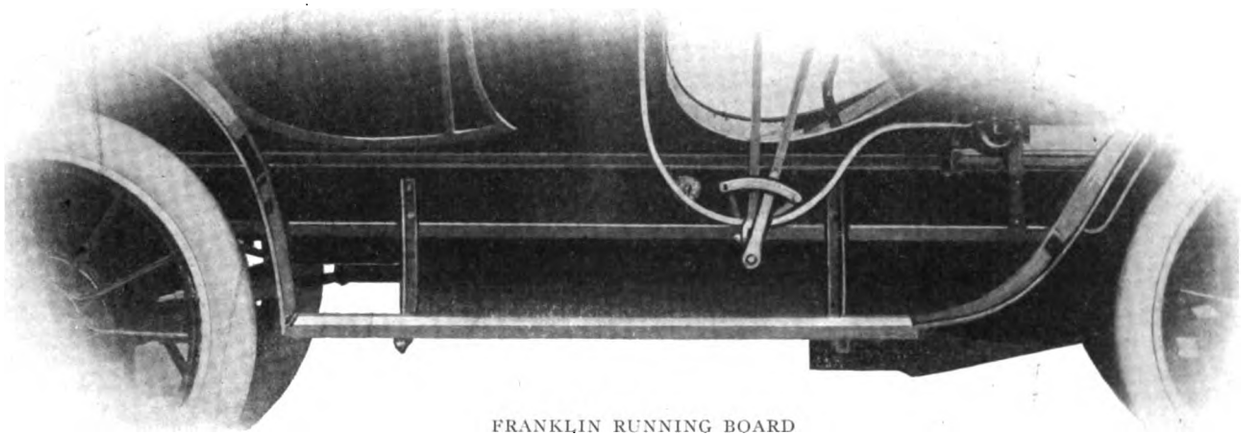
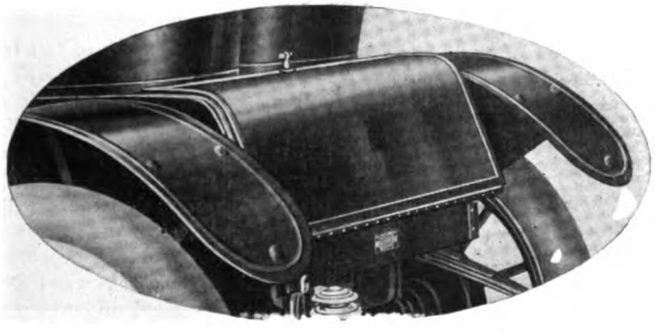
DEVELOPMENT OF BODY DETAILS



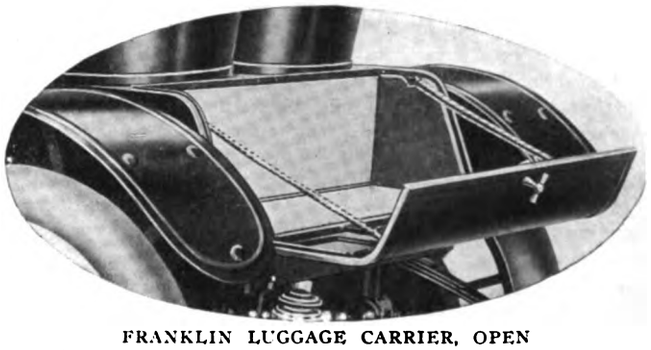
Franklin Improvements in Running Board Shields—New Idea to Facilitate Conveyance of Luggage.

Illustrative of the close attention to detail which the designer of the thoroughly up-to-date motor car is forced to exercise in order to keep abreast of the times, is the development in running board and mud guard construction which has come about within a year or two. Formerly the use of plain guards developed along the familiar lines laid down by carriage builders was considered sufficient. Now, however, the subject is studied with almost as much care and as intimate regard to the treatment of the air-currents beneath and alongside of the machine, as is done in the laying down of the molds for the construction of a ship's hull. Indeed, the methods of treatment must be much the same in the two cases, widely divergent though the actual conditions of use may be.



A case in point is the latest "kink" in the construction of the running board shields which are being fitted to the new Franklin models, one and all. Not content with filling in the space between the frame sills and the board with a dust excluding medium, the H. H. Franklin Mfg. Co. is going a step further in providing against the accumulation of mud and dirt in the angle between the board itself and the shield. The novel feature in its construction is that instead of being closely fastened at the board it turns inward at the base, thereby leaving a small opening. Consequently any dust or dirt which is thrown onto the board from the outside, instead of caking into place and forming an unsightly and even dangerous mass, sifts through between the shield and board and falls back into the road. As a matter of course, the shape of the lower portion of the shield is such as to prevent any objectionable matter from being thrown up and outward from beneath the car. Many otherwise satisfactory running boards have an unpleasant feature of accumulating really astonishing amounts of mud. It is to obviate this drawback that the arrangement which is here illustrated has been conceived and adopted.

Another difficulty which is presenting itself to the designer with increasing insistency is that of providing suitable accommodation for luggage. With the touring car with its more ample lines, this is readily taken care of by the adaptation of some simple form of luggage or trunk rack at the back of the body. With the runabout type of body, however, the problem is less easy to dispose of. In the 1909 model of the 42 horsepower Franklin cars, however it has been taken care readily enough by means of a partially concealed space under the rear seat, the lid of which may be opened out to form a veritable luggage rack, and which, when not in use, does not detract from the generally trim appearance of the car.



The accompanying illustrations show the simplicity of the arrangement. As will be seen from the first, there is nothing abtrusive in the small rounded box behind the seat which merely completes the regular outline of the rear portion of the body. As the second picture shows, however, the lid which opens from the rear, encloses a receptacle of sufficient size to accommodate a surprising amount of luggage, which is thus safely stowed away out of the reach of dust and mud. By opening the lid to its full distance against the chains which hold it, it is transformed into a carrying rack of sufficiently ample proportions to carry several suit cases, or even a small sized trunk, while the up-turned edge of the lid serves a useful purpose as a deflector of dust.

FRANKLIN RUNNING BOARD

FRANKLIN LUGGAGE CARRIER, CLOSED

FRANKLIN LUGGAGE CARRIER, OPEN

Big Total of One Year's Shipments.

Some idea of the volume of business done by one maker in the course of a season of activity may be gleaned from the statement issued by the H. H. Franklin Mfg. Co., that during the last "trade year" no less than 654 freight cars have been filled with automobiles and shipped from the Syracuse (N. Y.) plant. When it is remembered that this includes the period of curtailment of last fall, it may be imagined what a traditional "banner year" would hold in store for the railroads.

DISCUSSING BRIARCLIFF PLANS

Promoters Practically Decide on Holding Another Race—Question of What is a Stock Car Puzzles.

Whether or not a stock car race is a contest in which stock cars are eligible as entrants, is a question that is worrying the Automobile Manufacturers Association, the organization that promoted the Briarcliff race in Westchester county last April. At a meeting held December 2, at the Automobile Club of America, it was practically decided to hold another Briarcliff race next spring, but the inability of the members to agree upon the method of engine measurement for the next contest prevented the association from making definite progress in its plans. The difficulty lies in the fact that several makes of high-powered stock cars now on the market have a cylinder bore larger than the limit now fixed by the new international rule (5.1 inches), and oddly enough the association expresses itself as anxious to prevent the possibility of specially built foreign racing cars being brought over here to compete as alleged "stock cars." At the same time, the makers of cars with a large bore do not want to go to the expense of constructing new models to conform to the new rule, contending that a stock car race should be exempt from rating on a cylinder dimensions basis. Manufacturers of smaller stock cars, on the other hand, are anxious to have the bore limit reduced so that they will not be handicapped in this respect. Neither the date nor location for the race have been determined as yet. Indeed, there is no certainty even that the contest will take place in Westchester county although the name Briarcliff will still be retained. The date will be later than last year.

Dingley Supplies Thrills at Bakersfield.

Bert Dingley, who will be recalled as one of the earlier Vanderbilt cup drivers, and who has been distinguishing himself at numerous western meets this season, went down to take a flyer at a tame track meet at Bakersfield, Cal., on Saturday, 29th ult., and had things pretty much his own way, chiefly through the misfortunes of others. The events on the program were scarce and Dingley won what there were, driving a 40 horsepower Chalmers-Detroit "Bluebird." He reeled off the fastest time that had ever been seen on the local half-mile track, making a lap in 0:40 flat, a mile in 1:20, and 5 miles in 6:54 in various trials.

In the 10 miles race, Frank Free, driving a Sunset, gave Dingley a hot tussle, until the third lap, when the Sunset went crashing through the fence. Free was thrown, but neither car nor driver was badly injured. Dingley kept up his hot pace and circled the 20 laps in the brisk time of 14:00½.

Another 10 miles race was started as a handicap affair, Dingley allowing Murray, a San Francisco driver, a full lap. Dingley began to gain on his opponent from the start, when suddenly Murray's Buick crushed its rear wheel in the first mile and left the race to the Chalmers-Detroit.

Los Angeles Plans a Motordrome.

If the plans of a group of western capitalists are prospered Los Angeles, Cal. will have a cement race track for the exclusive use of automobiles. The proposition to lease Ascot Park for a term of 14 years, has been under consideration for some time and on the first of the month a certified check was posted with the directors of the jockey club that formerly operated Ascot as a horse race track. This deposit is said practically to have closed the deal and the construction of the new course is about to proceed. It will be not unlike the Brooklands track in England, scientifically banked at the turns, although of considerably smaller dimensions. Several members of the Automobile Dealers Association of Southern California will be the directors of the new enterprise and all races held on the course will be under the auspices of this body.

Florida Has the Sandfest Fever Again.

Annual efforts looking toward the promotion of a sandfest on the Ormond-Daytona course are again in evidence, a late date in the latter part of March having been tentatively advanced in a cautious way as being most suitable for various reasons. The Florida East Coast Automobile Association, with headquarters at the Daytona end of the beach and ample local real estate interests at stake, is reputed to be anxious to secure the management of the proposed event in advance of its Ormond neighbor.

Wilkes-Barre Booming Its Hill Climb.

With the hope of definitely making the Wilkes-Barre (Pa.) hill climb the international hill climb of next year and ensuing years for some time to come, G. N. Lee, president of the Wilkes-Barre Automobile Club has been in New York City this week arranging the preliminary details of the contest, and incidentally courting the patronage of the Automobile Club of America for the event. It is announced that the contest will be held on May 31 next, and not May 29, as first planned.

Milwaukee Club Plans for New Home.

At a recent meeting of the Milwaukee Automobile Club, Clarke S. Drake was elected president; W. L. Hibbard, first vice-president, and F. Printz second vice-president. It was decided by the members present to begin the erection of a new club house in the near future and a committee was appointed to inspect various proposed sites with that object in view.

TO KEEP DOWN PERFECT SCORES

Worcester's Endurance Contest to be Run Under Exacting Conditions—Five Blind Trips on the Schedule.

One of the most exacting short distance endurance contests ever planned will take place on Saturday next, 12th inst., when the Worcester (Mass.) Automobile Club holds its 200 miles reliability run. Things are not to be handled in slip-shod fashion by any means and the committee in charge of the contest has inaugurated a novel feature or two in its system of determining penalizations, which are well calculated to keep down the number of "perfect score" contestants.

Besides being run under the regular "sealed bonnet" conditions, with official observers, there will be two examinations of contestants, one before and one after the run, at which times minute measurements of parts will be taken to note any change in alignment, the amount of dish in front and rear wheels, and the "set" of the springs. Each of these examinations will cover the following measurements:

Distance between felloes of front wheels and ground.

Distance between felloes of rear wheels and ground.

Distance between center of right front and right rear wheels at center of hub caps.

Distance between center of left front and left rear wheels at center of hub cap.

Vertical distance from center of right front spring to frame.

Vertical distance from center of left front spring to frame.

Vertical distance from center of left rear spring to frame.

Vertical distance from center of right rear spring to frame.

Before the final examination there will be a brake, clutch, transmission and motor test. In the clutch test the front wheels of the car will be tested against a vertical 8-inch curb, the low gear engaged and the clutch let in. Failure to spin rear wheels or climb curb will signify a bad clutch and 30 points will be docked.

In the transmission test, the cars will be driven on different forward speeds and reverse. Failure to drive on any one speed will cost 25 points. To determine whether the transmission is tight, contestants will have to stop the motor, then engage clutch and low gear and then push the car back and forth, to note whether the transmission case is loose on the frame.

The run will cover five different blind trips about Worcester, of 40 miles each. Cars are to be checked at approximately every 20 miles, with 3 minutes leeway on the prescribed schedule at controls. There will be no postponement of the contest in the event of inclement weather.

DRASTIC JUSTICE IN CONNECTICUT

Chauffeur, Convicted of Manslaughter, Gets Prison Sentence—The Court Mercilessly Denounces Recklessness.

Not less than three nor more than four years in State's prison is the severe sentence that Judge Case in the Connecticut Superior Court imposed upon William H. Phair, a chauffeur who ran down Robert G. Merriman as the latter stepped from a trolley car in Hartford some time ago. The judge pronounced this penalty on Wednesday, December 2, the defendant having been convicted on a charge of manslaughter, partly with the intention of making an example of him. In summing up the case, the judge said:

"It seems to me that this case presents a particularly grave instance of criminal recklessness, and while I am fully impressed with the strong evidence presented here as to this man's previous excellent character, that neither condones his offense nor makes it possible for the court to overlook the public rights in imposing sentence. There is no more room on our public streets for an automobile in the hands of a drunken chauffeur than there is for a loaded rifle in the hands of a drunken soldier; one is hardly less a menace to human life than the other. But while this case is a serious one and calls for a serious penalty, it is well also to remember that an actual criminal intent is lacking. It is the man's gross recklessness that has brought him here, his gross disregard of the rights of other travelers, and his gross abuse of the responsibilities which every reasonable man should feel attends the running of an automobile on the public street, and I trust the lesson which this case suggests will lodge with profit to themselves and with benefit to the rest of the public in the minds of that obnoxious class of automobile drivers, who obey no law that runs counter to their own selfish convenience."

Hartford Forbids Hampering Motorists.

Hartford, Conn., has a new traffic ordinance possessing several good features, at least one of which would prove a fine thing for any other cities. It has to do with the crowding of automobiles by trucks and other vehicles in such a manner as to cause damage, and is aimed at the vicious practices of teamsters which are so common. A few days ago an arrest was made in Elm street, Hartford, under the recent provision and the offender fined for violating the road rules. John Kraftcon, a truckman, was driving on the right side of the road, when he suddenly swung over to the left-hand side in front of an approaching trolley car. His action was so timed that it pocketed an automobile belonging to Max Adler and driven by Samuel Gardner, between the trolley car and the truck. The chauffeur was on the proper side of the street, running in the same direction as the trolley and while he made an effort to prevent a smashup, he could not avoid swinging into a telegraph pole at the curb, breaking a rear mud guard. The truckman declared that his horse had been frightened by the trolley and as there was considerable doubt in this respect, the court fined him only $1 and costs.

Trolley Car Cuts a Cab in Two.

A growing sense of their own importance has led many taxicab drivers into the error of supposing that their career of reckless driving could go on forever unchecked. Occasionally, however, punishment is automatically meted out to them. A favorite pastime among them is that of racing with trolley car motormen to a certain post or "L" pillar and then cutting in ahead of the surface car in a manner that causes the motorman to slam on his brakes hard enough to flatten the car wheels, in order to avoid a crash—for taxicab drivers know full well the timidity of the knights of the controller and gong.

One Pat Cleary, on December 3d, however, suffered his just deserts when he tried this stunt without signaling to a motorman and since then he has been wondering how that Sixth avenue car that jammed his mount against a pillar at Forty-fourth street, New York City, could cut the cab in two so neatly. The trolley made such a clean cut job of it that the cab was divided into two ludicrously even halves. Fortunately, no one was in the vehicle at the time and the driver sustained only slight bruises.

Chicago Questions Taximeter Readings.

Suspicions as to the correctness of taximeter readings have been raised as the result of wide differences in the tariffs asked by different drivers going over the same route. Complaints have recently been pouring into the city hall at Chicago in great number, stating that there is something wrong with the instruments. One man, who uses taxicabs regularly between his office and his home, states that the legal rate is 90 cents, but that sometimes the meter will show $1.00, frequently $1.10, and occasionally $1.20. At present there is no municipal inspection of taximeters in Chicago, but the aldermen are considering putting the instruments in the same class with gas and electric meters, and therefore, subject to examination and test by the city authorities.

Scranton to Have More Cabs.

Scranton, Pa., will shortly have an abundance of taximeter cabs, as two concerns are now preparing to operate there. The Lackawanna Automobile and Taxicab Co. has been formed and will compete with the Scranton Garage and Motor Car Co., which has announced that it will introduce cabs of this type very soon.

CALIFORNIA'S MOTOR CAR CENSUS

Registration for Three Years Shows Total of 18,698 Vehicles—Aggregate Value Estimated at $37,000,000.

That there is about $37,000,000 worth of motor cars in the state of California, is evidenced by the last monthly report of Charles F. Curry, Secretary of State, in which he says that during the past three years 18,698 motor vehicles have been registered in his office. Estimating the average value of each car at $2,000, the large figure mentioned above is not far wrong, and while a number of the registered cars have been destroyed, others have been brought from other States and not registered, so that $37,000,000 is a fair estimate of the value of cars represented within the borders of the Golden Gate State.

The registration at the end of 1905 was 4,727. Taking it on the same basis, it would mean an invested interest of $9,454,000. At the end of 1906 the total registration was 8,764, with a valuation of $8,074,000, showing a decrease of $1,380,000. But this is accounted for to a great extent by the fact that the registration in 1905 took into consideration all the cars in existence at the time the law went into effect.

In 1906 many cars were destroyed by the big fire and were not replaced during the remainder of that six months. In 1907 there were 5,241 cars registered, conservatively estimated to be valued at $10,482,000. This shows a gain of $2,408,000 over 1906, being a net gain of $1,128,000 over the slump of 1905. For the 10 months of 1908 there have been 4,693 registrations, estimated to be valued at $9,386,000.

District of Columbia's Automobile Income.

In its annual report to the commissioners, the automobile board of the District of Columbia states that during the last fiscal year, $2,666 was received in fees from identification and registration tags issued to owners and operators of motor vehicles. During the year 1,050 persons were examined by the board and of this number 1,035 received permits. Since the date of the first automobile examination in the district, held August 11, 1903, 4,366 permits have been granted to motorists.

The report recommends that all persons operating motor cars, other than the owners and members of the owners' families and non-residents, be required to take out a license and pay an annual fee of $1, basing the recommendation on the ground that every State in the Union having motor vehicle laws makes a similar charge.

Dallas Gets Taximeter Cab Service.

"Grand old Texas" is to have taximeter cabs, too. Five machines have been put in service in Dallas, by C. G. Galloway.

The Week's Patents.

897,664. Disappearing Luggage Carrier for Automobiles. Edward T. Robinson, St. Louis, Mo., assignor to St. Louis Car Company, St. Louis, Mo., a Corporation. Filed Feb. 11, 1908. Serial No. 415,357.

1. The combination with a vehicle body, of a luggage frame slidably mounted in said body, so as to be shiftable thereunder, flexible means attached to the forward and rear ends of said frame, and means carried by said body on which said flexible means is operable, substantially as set forth.

897,694. Spring Suspension. William O. Worth, Evansville, Ind. Filed Nov. 21, 1906. Serial No. 344,427.

1. A spring suspension of the class described embracing a long semi-elliptical body spring and a shorter elliptical spring having one section rigidly bolted to the same and the upper section of the elliptical spring connected directly with the axle.

897,701. Detachable Rim for Vehicle Wheel Tires. Edwin A. Baker, New York, N. Y., assignor to Rapid Removable Rim Company, New York, N. Y. Filed Jan. 25, 1907. Serial No. 354,014.

1. A wheel construction, including a tire rim, a platform, one of said members having a recess, and two clamping members in said recess, one of said members being circumferentially adjustable; and the other member being radially adjustable.

897,715. Apparatus for Indicating or Recording Speed. Leonard E. Cowey, Brondesbury, England. Filed Oct. 26, 1905. Serial No. 284,524.

1. In apparatus for indicating and recording the speed of vehicles and other machines, the combination of a record bearing member, means actuated by the speed indicating mechanism of the apparatus for producing a speed-indicating record on said record bearing member, and means whereby said record is automatically obliterated by the working of the apparatus after a predetermined interval has elapsed, for the purpose specified.

897,726. Vehicle Tire. John L. G. Dykes, Milford, Ill. Filed July 30, 1906. Serial No. 328,397. Renewed May 6, 1908. Serial No. 431,162.

1. The combination with a tire body having a longitudinally split outer periphery and radially projecting flanges on either side of said split portion, of metal clamping rings applied to the outer sides of said flanges, the outer edges of said rings constituting in part the tread surface of the tire, and clamping bolts passed through said rings and flanges.

897,811. Automatic Pneumatic Tire Inflater. Robert C. Barrie, Philadelphia, Pa. Filed June 18, 1907. Serial No. 379,673.

1. In an automatic compensative air injector for automobiles, the combination of hub clamps with co-operative bolt fastenings for stable application, a projected lub serviceable to guide and guard the piston rod, a foot piece adjustable to various tire diameters, a piston and inclosing cylinder provided with end and side valves with a flexible tube connection to the air chamber of the wheel tire, substantially as set forth.

897,841. Tire Tool. Gustave Mohme and Aaron V. Hadlock, Chicago, Ill. Filed Feb. 8, 1907. Serial No. 356,457.

1. In a device of the kind described, a bar, a pair of arms pivotally connected to said bar at opposite ends thereof, each arm being provided with a transverse recess at its end, and the face of each arm arjacent its end being in a plane at an angle to the face of the rest of the arm, a wire guide and a wire clamp near the end of each arm, and means for causing movement of the ends of said arms towards and from each other.

897,861. Variable Speed Driving Mechanism. Henry M. Norris, Cincinnati, Ohio. Filed April 13, 1908. Serial No. 426,807.

1. In a variable speed device, a first and second shaft, a driving gear loose on one end of the first shaft, a compound gear adapted to turn with and slide on the intermediate portion of the first shaft, and having a clutch member formed thereon, and a third gear loose on the other end of the first shaft and having a co-operating clutch member for said first named clutch member, a double gear fixed to the second shaft meshing with the driving gear on the first shaft and adapted to be intermeshed with one of the members of the compound gear of the first shaft, a middle gear fixed to the second shaft and adapted to be intermeshed with the other member of the compound gear on the first shaft, a third gear fixed on the end of the second shaft and intermeshed with the end gear on the first shaft, and means for shifting the said compound intermediate with its clutch, substantially as described.

897,880. Wheel Tire. Josiah S. Cushing, Norwood, Mass. Filed Feb. 8, 1906. Serial No. 300,036.

1. In a resilient wheel, a felly having vertical guiding means extending continuously therearound, a flexible tire attached to said felly having radially and inwardly extending guiding means thereon, said tire guiding means extending inwardly beyond and being at all times in sliding engagement with said felly guiding means, whereby the tire is radially guided and laterally supported, and a continuous circular band within the tire, surrounding the felly, at a distance therefrom, which transmits the weight of the load to the tread portion only of the tire, substantially as described.

897,881. Elastic Wheel. Andre Dauvergne, Lyon, France. Filed Nov. 29, 1907. Serial No. 404,337.

1. An elastic wheel comprising in combination a rigid felly, a hub independent thereof, and capable of movement relatively thereto in the plane of rotation, a series of diametric spokes having central portions in sliding engagement with said hub, cushioning means interposed between the outer ends of each spoke and the inner surface of the felly, a central drum and rigid connections between the latter and the felly substantially as described.

897,909. Friction Clutch. Daniel F. Lepley, Connellsville, Pa. Filed July 17, 1907. Serial No. 384,196.

1. In an internal friction clutch, a revoluble disc or wheel having slots in its rim, one wall of one of the slots being concaved, a friction band encircling the rim, a lever pivotally mounted in one of the slots and having a curved seating face resting against the concaved wall of the slot, means for adjusting said lever to compensate for wear of the parts, a second lever extending through a second slot in the rim and engaging the opposite end of the band, and means for operating the second lever to apply or release the clutch.

897,936. Valve Stem Case. Edward B. Sinkler, New York, N. Y. Filed Oct. 1, 1907. Serial No. 395,350.

1. The combination with an engine having a valve stem and an actuating device therefor, of a case extending between relatively stationary parts of the engine and inclosing the exposed portions of the valve stem and actuating device, and a spring engaging the valve stem to seat the valve and also engaging the case to hold it in place.

898,043. Shock Absorber for Vehicles. Chas. K. Foster, Centerville, R. I. Filed June 12, 1907. Serial No. 378,557.

A shock absorber composed of a cylinder and a piston therein, said cylinder having ends provided with inwardly extending flanges interiorly threaded and secured to the cylinder, a plate transversely curved and disposed between said flanges, said plate having right angular ends which are curved and secured to said cylinder, enlarged portions at each end of said plate, each of which is apertured, and a screw in each of said apertures, the wall of said cylinder adjacent said plate being formed with openings aligning with said openings of the plate and adapted to receive said screws therein.

898,054. Projecting Lantern. Charles M. Lungren, Bayonne, N. J., assignor to The Railway Utilities Company, a Corporation of New Jersey. Filed May 20, 1907. Serial No. 374,678.

1. A projecting lantern comprising in combination, a lantern body having a forward lens and an opening intermediate the ends of its upper portion, a ventilating hood overlying said opening, a vapor burner positioned in said opening by laterally extending lugs secured to said body, one or more of said lugs having air channels, an inspirator for commingling with vapor the air from said channels a depending burner tube, a relatively small globular mantle mounted on the lower end of said tube, and a superheating coil arranged above said mantle in the path of the rising products of combustion.

898,057. Wheel. John W. Meixell, Lewisburg, Pa. Filed Feb. 17, 1906. Serial No. 301,596.

1. In a wheel, a rim tubular in cross section and having one edge turned up to form a clamping member and provided below the same at intervals with transverse registering bolt holes, in combination with a removable ring located at the opposite side of the rim at which said turned up edge is located and forming the opposite clamping member, and a series of bolts located in the bolt holes and terminating at one end beyond the rim in angular heads engaging the ring, said bolts being of a diameter agreeing with the space within the hollow rim whereby they reinforce the outer wall of said rim, and nuts for the ends of the bolts.

898,082. Brake for Vehicles. William Wolfe, Patton, Pa. Filed Aug. 22, 1907. Serial No. 389,644.

1. A vehicle brake, comprising a drop frame pivotally connected to the vehicle body in advance of the wheels to be braked and provided with arms extending toward the wheels to be braked, brake-shoe carriers telescopically combined with the arms of said drop-frame, brake shoes secured to said carriers in advance of the wheels to be braked, mechanism operatively connected to the said brake shoe carriers, and means for operating said mechanism arranged to exert its influence from a point in advance of the wheels to be braked, whereby a manipulation of said means operates to telescope

Digitized by Google

said brake shoe carriers, withdraw the brake shoe forwardly from engagement with the wheels and lift the drop frame, substantially as described.

898,107. Heat Dissipating Device for Gas Engines. George S. Hill, Bradford, Mass., assignor to Hill Motor Car Company, Haverhill, Mass., a Corporation of Maine. Filed July 27, 1905. Serial No. 271,449.

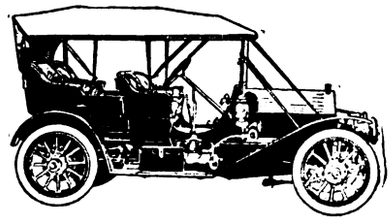
1. A heat dissipating device for gas engines, comprising a fan shaped pin having integral protuberances.

898,139. Internal Combustion Engine. David Roberts, Grantham, England. Filed Nov. 9, 1907. Serial No. 401,487.

1. In an internal combustion engine, the combination with the cylinder and piston, of a vaporizing chamber exterior to but directly communicating with the cylinder, and having a portion of its wall not provided with a water jacket, and other portions provided with a water jacket, said chamber having an aperture on the water jacketed side, communicating with the air inlet and exhaust passages and valves controlling said passages, whereby said aperture serves as the air inlet and the exhaust outlet, substantially as described.

898,175. Power Transmission Mechanism. Wallace E. Belt, Dodge Center, Minn. Filed July 8, 1907. Serial No. 382,752.

1. In combination with the hub of a wheel to be driven, provided with a friction surface, a drive shaft, a system of levers each provided with an eccentric surface, a friction shoe carried upon said eccentric surface, and means carried by said shaft for turning said levers and causing said shoes to impinge against said friction surface and transmit motion from said shaft and for holding said levers inoperative when the driven element rotates at a greater speed than the driving element.



898,238. Radiator. Joseph B. Long and Frank Todd, Chicago, Ill.; said Todd assignor to said Long. Filed May 11, 1907. Serial No. 373,157.

1. A radiator having a plurality of tubes and a plurality of strips of sheet metal having transverse flutes or corrugations, a pair of said strips being arranged between each two adjacent sides of each pair in contact with each other and the flutes on the remote sides of each pair in contact with adjacent

PENNSYLVANIA

1909

Meeting the demand for a small and light car the type "D" "25" has been produced. In every detail but size and horsepower the new type "D" "25" will equal the great Pennsylvania "50."

1909 Type "D" "25" (A. L. A. M. rating 29)
Roadster, $2,000
Baby Tonneau or Touring Car, $2,100

The famous Pennsylvania type "C" "50" remains unchanged, now and forever, price $3,000. All models equipped with magneto and gas tank.

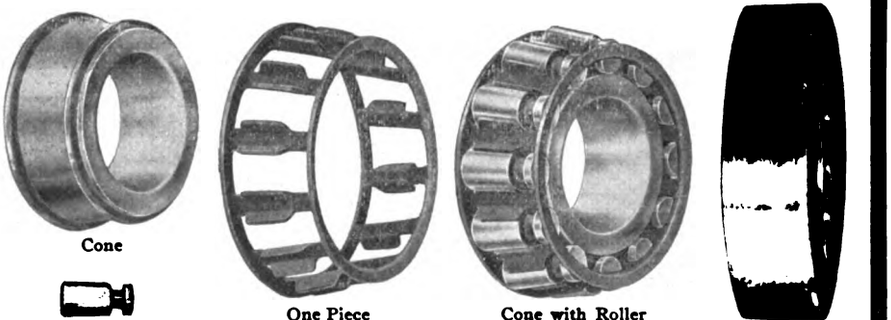
tubes, the summit of one of each two contacting flutes having a groove into which the summit of the other projects.

898,249. Steering Mechanism. James G. Maxwell, Washington, Pa. Filed Dec. 17, 1907. Serial No. 406,848.

1. A steering mechanism comprising the combination with the hubs of a pair of wheels, a pair of supporting plates, an axle mounted in each of the hubs and provided with an inward extension terminating in a bearing and positioned between the plates at one end, means extending through the plates and bearings for pivotally connecting the bearings, a pair of confronting segment shaped racks interposed between said plates and of a length greater than the width of the plates, a pinion arranged between and meshing with the racks, a vertical bearing for the pinion, a pair of connecting members one being between each rack and its adjacent bearing, said members positioned between said plates, an actuating pinion arranged within and engaging with one of the racks and adapted when operated to shift the first mentioned pinion and the racks whereby the bearings are revolved upon their connecting means, and means for operating the actuating pinion.



898,278. Steering Gear. Daniel W. Smith, Oyster Bay, N. Y. Filed Jan. 8, 1908. Serial No. 409,826.

1. Steering gear of the class described comprising in combination with a steering rod shaft, a gear wheel mounted fast on the shaft, an equalizing gear mounted loosely on the same shaft, a driven gear mounted on an exis at right angles to said shaft, and meshing with the fast and loose gears on said shaft, and an oscillatory arm bearing a fixed relation to the driven gear and adapted to transmit motion to the steering connections of the steering wheels.

898,280. Vehicle Wheel. Irving Snell, Little Falls, N. Y. Filed Oct. 22, 1907. Serial No. 398,556.

A vehicle wheel having a felly, a metallic band encircling the felly and rigidly secured thereto and of a width greater than said felly, a resilient band encircling said metallic band and having a plurality of cavities or openings therein, a second metallic band encircling said resilient band and connected to said first-mentioned metallic band, a second resilient band encircling the second metallic band and having a plurality of ridges on its peripheral surface, means carried by said last-mentioned metallic band for engagement with the last-mentioned resilient band and encircling the wheel.

New Series TIMKEN Short Bearings

In offering the Automobile trade our **New Series Timken Short Bearings,** we do so with the assurance that they are made from the same carefully selected steel and subjected to the same severe tests as our standard size Bearings.

The **New Series Short Bearings** are designed for use in axles where the bearings space does not permit the use of our regular series.

These Short Bearings can be used in any axles where Annular Bearings can be used. They carry **a much greater load** than Annular Bearings of the same length, **are smaller in diameter** and in addition will take as much **end thrust** as they do **radial load.**

Every bar of steel entering into **Timken** Products is made to the **Timken** analysis chemically—and tested to the **Timken** test physically—which means a rejection of **45 per cent.** of every ingot before metal of suitable density and soundness for **Timken** Roller Bearings can be obtained. These new Short Bearing Rollers are made from best nickel steel.

This is one reason why **65 per cent.** of the makers of high-grade Automobiles and over **90 per cent.** of the commercial truck builders of this country use **Timken** Roller Bearings. **WRITE FOR CATALOG AND PRICES**

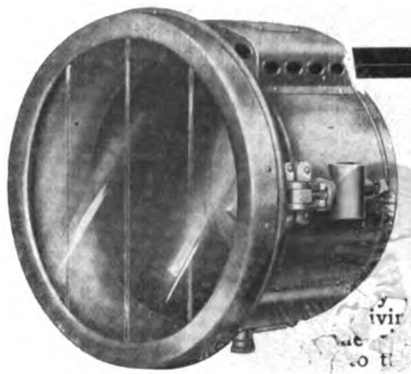
WEED CHAINS

Positively Prevent Skidding



They grip and hold the road wheels in mud and sand without injury to the road. All possibility of slipping or skidding on wet or greasy pavements is eliminated. They preserve tires and enable the heaviest automobile to climb hills easily. They reduce gasolene consumption by preventing lost traction.

We exhibit at Grand Central Palace' January 1, and Madison Square Garden' January 16.

A COURTEOUS REQUEST

The Rich, Mellow Tones of a

1909 Gabriel Horn

act as a courteous request not a shrill demand. It warns without frightening and always secures for the user the right of way. The 1909 model has an ingenious device which allows its sweet three note tone used for city purposes to rise in unison at the will of the operator as a penetrating warning for country roads.

1909 Cut-Out and Horn Valve

When used for cut-out purposes, remove disc in main channel, thereby relieving back pressure from muffler through additional opening of 1¼ inches. Made to fit exhaust pipes 1" to 2½" outside diameter. Warranted not to stick under any condition. ¶ *Write for Catalog and prices.*

SUPPLEMENTARY SPIRAL SPRINGS

¶ If every driver had to ride in his own tonneau, every car would be quickly equipped with Supplementary Spiral Springs. Owners are not intentionally selfish—many of them just thoughtless. Usually driving or sitting beside the driver, the riding qualities of the tonneau are to them practically unknown.

¶ Not so with the passengers. Rear springs must be strong enough to resist severe shocks under a full load. That means stiff springs under ordinary loads, with the shocks and jars transmitted to the passengers—guests whose comfort ought to be a first consideration.

¶ **SUPPLEMENTARY SPIRAL SPRINGS** take up all the average bumps and road inequalities and come into real action with the jolts and jars encountered at speed.

¶ With the S. S. S., your springs never whip or touch. They prevent breakage and are the most economical and useful accessory ever provided for a car. Every live dealer carries them and their attachment is a matter of a few hours' time. Do it NOW.

SUPPLEMENTARY SPIRAL SPRING CO.
Motor Mart, New York 4555 Delmar Ave., St. Louis, Mo.

Gasolene—Electric—Steam

How the "goodness" is put into Morgan & Wright Tires

1—By using only the best grade of pure Para rubber and finest quality of long Sea Island cotton fabric it is possible to buy.

2—By employing the most experienced help to be had, going on the principle that with materials of a high grade the quality of a completed tire is dependent upon the amount of brains put into its making.

3—By making them in the light of twenty-eight years' experience in the manufacture of rubber goods.

4—By making them in the newest and best equipped rubber plant in the world.

5—By adhering to this unvarying rule: That *every* tire that leaves the factory shall be as perfect in material and construction as money and skill can make it.

If you want your tires made that way, why not specify Morgan & Wright's on your car for next year? They cost no more than other brands.

MORGAN & WRIGHT, DETROIT

The Largest Automobile Supply House in America

WINTER SUGGESTIONS

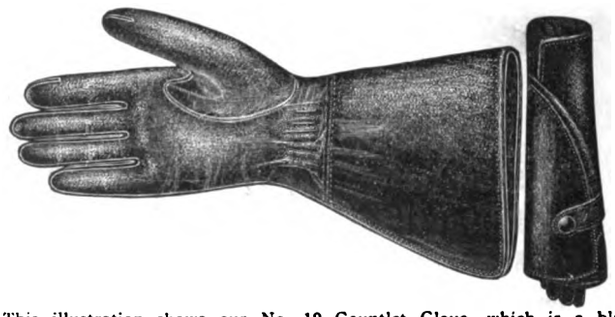
We have a large line of Leather Clothing, Caps, Gloves, Wool Vests, Wool Boots, Ways Mufflers, Storm Coats, Lap Robes, Etc.

ARGYLE AUTO BOOTS

Worn over Shoes for Comfort in Cold Weather Motoring.

The ARGYLE Auto boots are designed to give the motorist's feet complete protection from the elements during winter weather motoring. They are worn over the ordinary shoes and can be pulled on or off very readily. They will keep your feet warm and dry during the longest ride in coldest weather. You cannot realize the comfort they give in frigid weather, till you have worn a pair.

Every man, woman and child who motors in cold weather needs a pair of ARGYLE Auto Boots, no matter whether the time of exposure is a half hour or a whole day.



They are made of fine flexible leather, have strong leather Goodyear welted soles and are warmly lined throughout with genuine lambs-wool.

Made in all sizes, with long or short leg. Length of the long leg is 13½ inches,, and the short 10½ inches.

PRICES:

Long, per pair $9.00
Short, per pair 8.00

NO. 19 AUTOMOBILE GAUNTLET GLOBE

This illustration shows our No. 19 Gauntlet Glove, which is a black, seamless knit lined Automobile Gauntlet with extra large flexible cuff with 2 fastenings. This Gauntlet is made from the best selected imported black cape leather. It has a 7-inch Gauntlet with extra large cuff, 20 inches in circumference, which may be adjusted to smaller sizes. The cuff is lined and is guaranteed not to crack, and is stitched with genuine silk.

It will also be noted from the illustration, that the wrist is fitted with an elastic band, which will keep the Gauntlet tight, and comfortable on the wrist, and prevent it slipping down over the fingers.

The cuff is also flexible, and can be rolled into a small space, as shown in the small illustration, for carrying in the pocket. This is the finest Gauntlet Glove on the market.

Price, seamless knit lined, per pair $3.50

STEVENS-DURYEA

LIGHT SIX MODEL U

It has been a source of gratification to us to be the recipients of a number of unsolicited testimonials regarding our Light Six Cars.

Because of the great pressure individual owners exerted to have us build an additional quantity of these models, we were obliged to materially increase our output for 1909. The Light Six Automobiles we will market, considerably exceed in number the volume we had originally planned to construct.

The third consecutive year of the existence of the Stevens-Duryea Light Six Model U demonstrates how the popularity and consequent wide spread demand for this car is undiminished and unabated.

"Firestone"

NON-SKID TREAD

Composed entirely of rubber. Formed by the raised lettering "FIRESTONE NON-SKID" arranged obliquely across the tread surface.

Contains more angles, edges and points of road contact than any other non-skid.

Spaces in and between the letters cause a suction that grips the road and prevents slipping.

The wear-resisting quality of this tread is a revelation to motorists accustomed to the quick wearing down or tearing out of the ordinary non-slip devices.

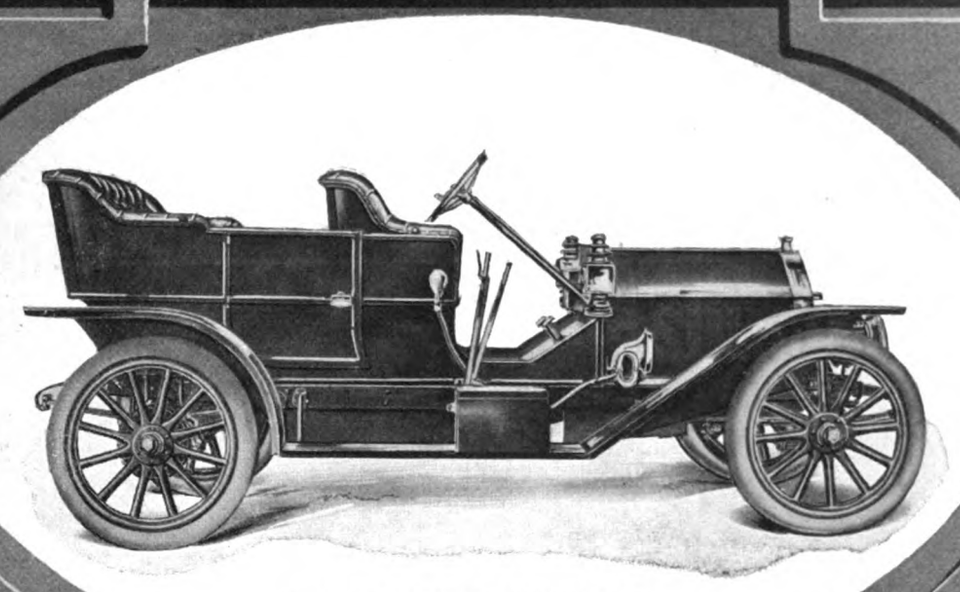
New Series TIMKEN Short Bearings

In offering the Automobile trade our **New Series Timken Short Bearings,** we do so with the assurance that they are made from the same carefully selected steel and subjected to the same severe tests as our standard size Bearings.

The **New Series Short Bearings** are designed for use in axles where the bearings space does not permit the use of our regular series.

These Short Bearings can be used on any axle, transmission, or other places where Annular Bearings can be used. They carry **a much greater load** than Annular Bearings of the same length, **are smaller in diameter** and in addition will take as much **end thrust** as they do **radial load.**



Every bar of steel entering into **Timken** Products is made to the **Timken** analysis chemically—and tested to the **Timken** test physically—which means a rejection of **45 per cent.** of every ingot before metal of suitable density and soundness for **Timken** Roller Bearings can be obtained. These new Short Bearing Rollers are made from best nickel steel.

This is one reason why **65 per cent.** of the makers of high-grade Automobiles and over **90 per cent.** of the commercial truck builders of this country use **Timken** Roller Bearings. **WRITE FOR CATALOG AND PRICES**

THE INTER-STATE TOURING CAR
Model 25, $1750.00

The Inter-State

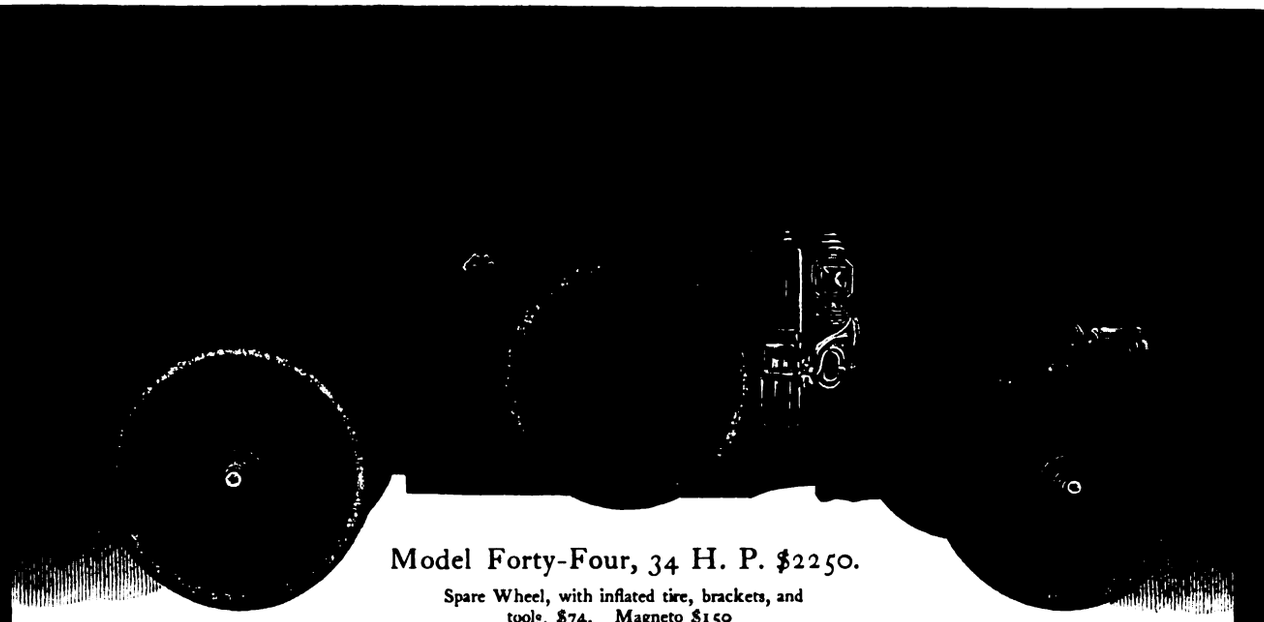
THE INTER-STATE Automobile is built for the intelligent purchaser who wants the high quality which heretofore has been found **only** in **high-priced** cars, but who does not want to pay from twenty-five hundred to five thousand dollars.

The INTER-STATE makes it unnecessary for such purchasers to pay such prices.

It is a **permanent** car, embracing every essential factor of worth in automobile design, style, comfort, speed, endurance, dependable materials and workmanship. And it is sold at a price—$1,750 complete, including Eiseman Magneto — but little higher that the cheap good-enough-until-later cars.

There is no economy and most assuredly no automobile satisfaction in buying a car that you will want to discard the second season for a **real car.** Especially since you can buy the **real** car, the **satisfying permanent** car **this** season for just a little more money than a temporary car.

In justice to your own best interests, let us urge you not to **think** of spending your money for a "cheap" car, or even a higher-priced good car, until you have seen the INTER-STATE. We are glad to let you be the sole judge as to its worth at $1750.



Dealers and Agents will appreciate the opportunities opened to them by the INTER-STATE. Write for our attractive proposition.

Inter-State Automobile Co., 126 Willard Street, Muncie, Ind.

AT THE SHOWS

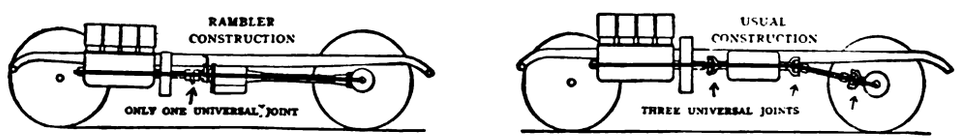
The full line of Inter-State automobiles, including Standard Touring Car, Demi-Tonneau, Double Rumble Roadster, Single Rumble Roadster and Tourabout, will be exhibited at Grand Central Palace, New York, December 31-January 7, and at the Coliseum, Chicago, February 6-13.

Digitized by Google

Model Forty-Four, 34 H. P. $2250.

Spare Wheel, with inflated tire, brackets, and tools, $74. Magneto $150

THE STRAIGHT-LINE-DRIVE



Power cannot be carried around a corner without great loss, due to friction. In the ordinary automobile much energy is wasted in transmitting the power from the engine to the rear axle through universal joints, or, in other words, around corners.

In the Rambler the driving shaft, when the load is in the car, is in direct line with the crank shaft and the angle found at one of the universal joints in most other driving systems is eliminated. The drive is thus accomplished in a direct line.

The Rambler straight-line-drive delivers the maximum power—saves energy—prevents wear—reduces cost of upkeep.

Rambler

The Car with the Offset Crank Shaft

Seven passenger Model, forty-five horse power, with offset crank shaft, $2500. Other models $1150 to $2500. Write for catalog describing in detail Rambler offset crank shaft, Spare Wheel, straight-line-drive and other exclusive features of the new Rambler models.

THE MOTOR WORLD

Volume XIX. New York, U. S. A., Thursday, December 17, 1909. No. 12

ANOTHER POPE COMPANY IS BORN

Makes Ready to Take Over Business from Receivers—Creditors to Get Payment with Interest Added.

Marking the final period of reorganization, a new Pope Manufacturing Co. was incorporated on Saturday, the 12th inst., which is to take over the property and business from the receivers. While bearing the same name as the old company, the new corporation differs from the old in that the papers were taken out under the laws of Connecticut instead of New Jersey. The incorporation is preliminary to the almost immediate transfer of Pope affairs to the reorganized concern, and indicates an early payment of a final dividend to all Pope creditors with approved claims. The receivers, Albert L. Pope and George A. Yule, further promise that 6 per cent. interest will be paid to the creditors on their claims for the period that payment was delayed, in addition to the satisfaction of the full face amount.

In accordance with the reorganization plan made familiar some time ago, the new company is capitalized with $2,500,00 preferred stock and $4,000,000 common, the shares having a par value of $100 each. The incorporators included Albert L. Pope, George Pope, Charles E. Walker and Wilbur C. Walker. At the meeting which was held in Hartford, Conn., on Saturday, there was present with the four incorporators, Attorney Lewis H. Freedman, of New York, representing beside himself, Harry Bonner, August Hockscher, Frederick H. Ecker, Albert Stickney, Henry V. Poor, Arthur W. Pope and Milton Ferguson.

Directors for the new company were chosen as follows:

For one year, Harry Bonner, Frederick H. Ecker and August Heckscher; for two years, Lewis H. Freedman, Albert Stickney and A. W. Pope; for three years, Henry V. Poor, A. L. Pope and Milton Ferguson. At a meeting of these directors, to be held shortly, the president and other executive officers will be chosen.

Bank Forecloses on Rainier Notes.

Notes aggregating $53,000 and secured by $100,000 in mortgage bonds covering real estate and other property of the company, were not taken up by the Rainier Motor Car Co., of Saginaw, Mich., when payment was due, and as a consequence the Bank of Saginaw, the holder, conducted an auction of the bonds on the court house steps, on the 4th inst., to satisfy the judgment. The notes represented an original loan of $50,000 to the company on July 29, 1908, together with two subsequent notes of $1,500 each given in lieu of interest payments.

Hardy Moves to Brooklyn Factory.

The R. E. Hardy Co., which makes "Sta-Rite" plugs and accessories, has moved its factory to Brooklyn, N. Y., taking space in the Bush Terminal buildings at Thirty-seventh street and New York Harbor. Three times the former factory area is provided by the change and further expansion is arranged for if necessary. The new factory address is 201 Thirty-seventh street, Brooklyn, while the office in Manhattan continues at 25 West Forty-second street.

Trenton Rubber in the Metropolis.

New York City headquarters for the Trenton Rubber Mfg. Co., of Trenton, N. J., have been established at 1997 Broadway. The office and salesroom will carry a large stock of the factory's products for the accommodation of the Metropolitan trade, including the company's inner tubes and Thermoid brake lining.

Morgan & Wright on Broadway.

Morgan & Wright have taken a long lease on a location at 1849 Broadway, to which the New York City branch, now on Forty-seventh street, will remove as soon as alterations can be completed. The building is above Columbus Circle, and is at present occupied by the C. G. V. Import Co.

PREPARE FOR THE TARIFF HEARING

Conference of Manufacturers' Committee—Miles' Statements Challenged—To Show Wage Comparisons.

Motor car tariff matters had a threshing out at a meeting on Saturday, the 12th inst., when the special committee having in charge the presentation of the domestic makers' case before the ways and means committee of the House at Washington, gathered in the board room of the A. L. A. M. headquarters in New York to perfect their plan of campaign. As a result of the meeting the American manufacturers will rest their objection to any reduction of the automobile tariff on the fact that they are paying more than twice as much as the foreign makers for corresponding labor and that a lowered tariff either means a lowered wage scale for employes here or a greatly lessened production, thereby endorsing the sentiment of the original brief published in these columns two weeks ago.

Those attending the conference were A. L. Riker, of the Locomobile Co. of America; Benjamin Briscoe, of the Maxwell-Briscoe Motor Co.; Alfred Reeves, general manager of the American Motor Car Manufacturers' Association; E. P. Chalfant, general manager of the Association of Licensed Automobile Manufacturers; H. B. Joy and E. H. Parkhurst. They went into session at about 1 o'clock in the afternoon and did not emerge until long after dark. The members of the committee had evidently been stirred to some resentment against H. E. Miles, of the National Association of Manufacturers, by his statement before the ways and means committee recently to the effect that he had information that a considerable portion of the domestic industry is in favor of a tariff reduction on automobiles. After the meeting a telegram was sent to Miles, challenging him to produce any dispatches or other evidence which he claimed to have in support of his state-

Digitized by Google

ment that ht had communications from makers entertaining this view.

Light was thrown on the question as to who could have supplied Miles with any such impression as he seemed to entertain, by the fact that on Monday, the 14th inst., an attorney for the Buick Automobile Co., which recently obtained much enviable notoriety by failing to pay its current obligations to the A. L. A. M., appeared before the ways and means committee in Washington and indicated that his company was agreeable to a reduction to 30 per cent., as against the present 45 per cent., intimating also that a prominent company in Lansing, Mich., in close touch with his clients, was likewise willing that there should be a reduction. The inquisitors of the committee, however, soon discovered the milk in the Buick cocoanut. They elicited the information that the attitude of Buick and the Lansing company in thus running counter to the otherwise unanimous opinion of the trade, was due to the fact that they had automobile factories in Canada, where they enjoyed a low manufacturing cost and could under a reduced tariff sell their Canadian products in the United States.

Indicating the general character of the pleading before the committee at Washington, at the hearing next Saturday, the 19th inst., Benjamin Briscoe, president of the Maxwell-Briscoe company, issued the following statement on behalf of the committee of automobile manufacturers, after its session:

"The automobile makers have no desire to ask for an unfair rate of tariff, or for any special treatment. While the figures of wages in this country and Europe indicate that 60 per cent. duty would be necessary for adequate protection in the matter of labor, they do not ask for anything more than the existing rate of 45 per cent. As automobiles have come into use since the passage of the Dingley Bill, they now come in under the classification of manufactured metals, and it is our desire to have them properly classified under the heading of automobiles and parts thereof.

"It is our belief that the tariff on automobiles should be one to protect the American workman against the low wages paid abroad. This is in accordance with the principles actuating a protective tariff, and is consistent with the doctrine of the party now in power. There can be no dispute as to the meaning of these principles and this doctrine, as set forth in the platform of the Republican party, and voiced time and again by President-elect Taft, who said 'that the Republican party is unequivocally for a revision of the tariff by a special session of Congress immediately following the inauguration of the next president.' and laid it down as 'the true principle of protection that such duties be imposed as will equal the difference between the cost of production at home and abroad.' And moreover, 'to establish maximum and minimum rates to be administered by the president under limitations fixed by the law, the maximum to be available to meet discriminations by foreign countries against American goods entering their market, and the minimum to represent the normal measure of protection at home; the aim and purpose of the Republican policy being not only to preserve, without excessive duties, that security against foreign competition to which American manufacturers, farmers and producers are entitled, but also to maintain the high standard of living of wage earners of this country, who are the most direct beneficiaries of the protective system.'"

As indicating how close the foreign markets are to American trade, Briscoe points to the statement made by the representative of the importers when he appeared before the ways and means committee, in which he stated that even a 12 per cent. reduction from the present tariff would be entirely satisfactory to the foreign makers. This statement was taken to imply that this small reduction was all that was needed to give the foreigners absolute control of the American automobile market.

Rowland the Second Typhoid Victim.

John B. Rowland, president of the Publicity Press, New York City, died at his home Friday night, the 11th inst., of typhoid pneumonia. His death, following that of A. B. Elliott on Thanksgiving Day, marked the claiming of the second victim of the disease with which five men well known in the trade were stricken following a lunch on November 4 at a prominent New York hotel, where oysters were served, and of which they all partook. Mr. Rowland was 31 years old, and was born in Washington, D. C. He attended Georgetown University, at which time he was conspicuous in rowing. His commercial career was chiefly spent in building up an advertising agency business, a field in which he met considerable success. Although he had been married several years, he had no children.

The three surviving victims of the fever, including T. J. Wetzel, L. A. Hopkins and Herbert Lytle, are reported to be improving rapidly. It is thought that they will all soon be restored to good health.

Sues Craig-Toledo Stockholders.

Stockholders in the bankrupt Craig-Toledo Motor Co., Toledo, O., are being sued by Joseph W. Lane, the trustee in bankruptcy, for approximately $30,000, to pay the debts of the concern in full. The action has been begun in the common pleas court, against 23 defendants. The trustee alleges that the debts of the company aggregated more than $45,000, while the proceeds from the assets amounted to only $16,000 or less. He asks that the court ascertain the solvent stockholders and the amount of unpaid stock subscriptions due from each, in order that they may be assessed enough to enable him to clear the company's indebtedness to the creditors. The company was organized with a capitalization of $100,000, and Lane alleges that $51,000 in stock was issued to John Swindeman for the assets of the Maumee Motor Car Works, later estimated as not worth more than $1,500.

Plan Jobbing Business in Pueblo.

Tempted by the prospects of a jobbing business in the Southwest, a new wholesale house is opening in Pueblo, Col., to be known as the Pueblo Automobile Goods Co., and located at 214 Pope block, on Fourth street. The concern is capitalized at $25,000. W. L. Anderson, of the Anderson Coal Co., is president; L. H. Walker, vice-president; F. H. Bullen, president of the Pueblo Bridge Co., treasurer, and Ralph Cruzen, secretary and manager.

Organize to Make Self-Starters.

Grand Rapids, Mich., is shortly to have a factory devoted to the manufacture of a self starting device for automobiles invented and patented a year ago by J. Watson Fitzgerald. The concern will be known as the Starter Mfg. Co., and is capitalized at $40,000. The owners of the company include W. W. Annabel, president, and J. Watson Fitzgerald, secretary-treasurer, holding $15,000 in stock each, with L. J. Clark, vice-president, holding $10,000.

To Make Tire Cements in Toledo.

All of the cement machinery, trade marks and trade names of the bankrupt National Cement & Rubber Co., of Toledo, O., having been bought by the Sterling Cycle Sundry Co., of the same city, the latter concern will engage in the manufacture of tire cements on a large scale. Emile Haberstock, general manager of the Sterling company, was formerly superintendent of the National business.

Will Blossom as the Sunflower.

The St. Joe Motor Car Co., of Elkhart, Ind., is to blossom out as the Sunflower Motor Car Co., after it moves to Hutchinson, Kan. It will raise its capital from $50,000 to $100,000, and residents of Hutchinson will be permitted to buy stock. Charles S. Conover, of Kansas City, is president; O. G. Sellers, of Elkhart, Ind., vice-president; and W. F. Feckler, of St. Paul, secretary and treasurer.

Lindsley to be Reorganized.

Plans to reorganize the insolvent J. V. Lindsley Auto Co., of Dowagiac, Mich., are on foot. It is proposed to ask for a receiver to straighten out the affairs of the old company, after which it will be reorganized with $50,000 capital and will take a location in Seymour, Ind.

Mossberg Takes Control of Auto-Cle.

The Frank Mossberg Co., of Attleboro, Mass., will in the future manufacture the Auto-Cle automobile wrench. This well known device has in the past been made by the Quincy, Manchester, Sargent Co., but hereafter the Mossberg factory controls it.

Rambler Show at New York Branch.

During the period of the New York automobile shows Thomas B. Jeffery & Co. will conduct a Rambler show of their own at their spacious New York branch recently established at 38-40 West Sixty-second streets. All Rambler dealers and friends will be entertained at the branch, and such conveniences provided as will make them feel at home. All of the 1909 Rambler models will be on exhibition and demonstration, and certain of the new features will be displayed in an attractive and convincing way. The Rambler spare wheel, which carries a fully inflated tire and can be substituteed for a regular wheel in three minutes, will also be shown.

Give Luncheon to the Garden Staff.

A luncheon to the staff of the Madison Square Garden was given by the management of the Association of Licensed Automobile Manufacturers, on the 15th inst., at the Hotel Breslin, New York, with the object of promoting a united spirit in making the coming Licensed automobile show at the Garden a complete success. The Garden delegation, headed by James C. Young, the secretary, and C. M. Schroeder, the business manager, included about 18 of the chiefs of various departments, while the Licensed contingent numbered about 14, headed by General Manager E. P. Chalfant, who presided.

Buffalo to Have Only One Show.

Buffalo's show situation promises to have a peaceful solution through the holding of but one show next spring. The annual election of the Buffalo Automobile Trade Association, just held, resulted in a victory for those favoring the one show plan as against the ticket whose platform advocated a separate exhibition from that given by the local automobile club. W. C. Jaynes headed the successful ticket as president.

Johnson Enjoins a City Purchase.

On the ground that the city did not issue a general call for bids, the Johnson Service Co., of Milwaukee, Wis., has obtained an injunction against the municipality restraining it from buying the car selected for the police department. The machine chosen was offered at $4,000, but the complaining company urges that more bids should have been invited.

Convention for Maxwell Dealers.

Maxwell dealers attending the Grand Central Palace show in New York will gather in annual convention on Tuesday, January 5, at the Hotel Manhattan. The new sales organization under which they are operating will be discussed.

Chase Reorganizes and Expands.

The Chase Motor Vehicle Co., of Syracuse, N. Y., has been reorganized and expanded. The plant in South West street is being remodeled and enlarged, while the working force is being increased to 500 men.

Midland Makes Capital Increase.

Increase in the capitalization of the Midland Motor Car Co., of East Moline, Ill., has been effected. The raise is from $100,000, at which the company incorporated last January, to $150,000.

Jeffery Branch in Cleveland.

Thomas B. Jeffery & Co. intend opening a branch in Cleveland, O. A choice of a location will be made in a few days.

In the Retail World.

Frank Z. Ames plans an automobile agency in Ottawa, Ill. He has leased the Ward building on Main street for the purpose.

W. S. Birnie, of Rome, N. Y., has built a new garage. In addition to carrying supplies, he will do machine shop and repair work as well.

H. M. Covey, of Portland, Ore., is in new quarters in the Wemme building, Seventh and Couch streets. Two floors accommodate his agency, repair and garage business.

The Deere & Webber Co., of Minneapolis, Minn., large dealers in agricultural implements, have added automobiles to their lines. They will handle the Velie, built in Moline, Ill.

A northern New Jersey branch of the Oldsmobile Co., of New York, has been opened in Newark, N. J. The formal opening took place at 88 Washington street this week.

The Central Pennsylvania Automobile Co., handling the Franklin at Harrisburg, Pa., has taken new quarters at Fourth and Chestnut streets. The building is 50 by 210 feet.

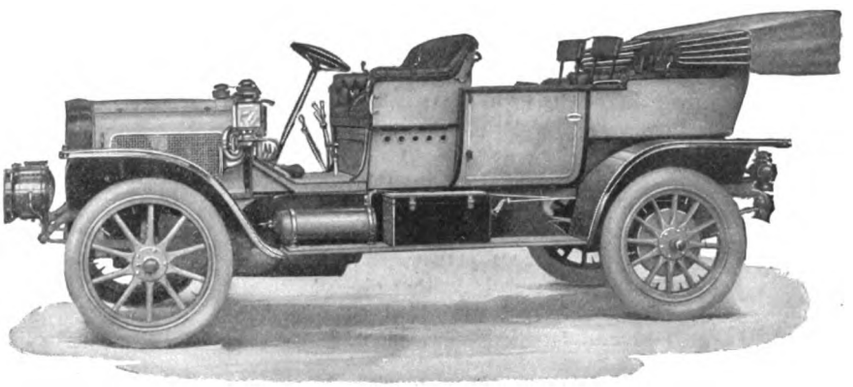
The Cameron Motor Co., of New York City, has taken a lease of the building at 231 West Fifty-fourth street. It will be made the Metropolitan headquarters for Cameron cars.

Charles Wentz and P. Miller, the latter a local theatrical manager, have opened an automobile agency in Dayton, O. It is temporarily located on Hannah lane, handling Jackson and Maxwell cars.

E. J. Wall, who until recently acted in the capacity of traffic manager for the Pope Mfg. Co., has joined the sales department of the Boston branch of Thomas B. Jeffery & Co. He will assist Manager C. P. Rockwell.

Rene A. Brassey, agent for the Thomas in Los Angeles, Cal., moves from Seventh and Olive streets to new quarters this month. The building prepared for him is at 846 South Olive street, and has all modern garage conveniences.

Racine Requires More Men and Space.



Increased business in the building of touring car, limousine and taximeter cab bodies, together with tops, dashes and other fittings, has led the Racine Mfg. Co., of Racine, Wis., to enlarge its factory. Two large, four story buildings have been prepared for occupancy and foundations for a third one are now being laid, while extensive purchases have been made of surrounding land, looking to future additions. A large number of expert body builders will be added to the force.

Worcester Will Try Taximeter Cabs.

John S. Harrington, of Worcester, Mass., believes that he can institute a successful taximete cab service there. He will install three as an experiment.

THE
MODEL "M" WHITE STEAMER
Is The Most Luxurious Car On The Market

The luxury of the White Steamer is unequalled by any other machine. There is no car, however expensive, which has better upholstery, better springs or better finish. Owing to the compactness of the mechanism, the body is much more commodious than in any car of similar wheelbase, (122 inches). Few other makes have such a liberal tire equipment (36x4 on the front wheels and 36x5 on the rear wheels.)

The luxury of any car, however, depends largely upon its riding qualities and here the White is "in a class by itself." It is the only car where starting and changes of speed can be effected without jerks or jolts. It is the only car which runs noiselessly under all conditions. It is the only car which is free from vibration, because it is the only car where the power is applied evenly and continuously, and not spasmodically.

Just as our Model "M," priced at $4,000, is the most desirable of the higher-priced cars, so our Model "O," at $2,000 predominates among moderate priced machines.

Write for descriptive matter.

Cable Address, "MOTORWORLD," NEW YORK.

Entered as second-class matter at the New York Post Office, November, 1900.

NEW YORK, DECEMBER 17, 1908.

The New York Show Numbers of the Motor World will bear dates of December 31st, January 7th, 14th, and 21st, respectively. The first two will interestingly and comprehensively forecast and describe the exhibition of American Motor Car Manufacturers Association, and the other two do similar duty for the show of the Licensed Association of Automobile Manufacturers. As usual, the Motor World's reports of both shows will deal with goods actually exhibited and will not comprise mere trade puffs or extracts from catalogs written weeks before the doors of the exhibition halls are opened.

The Multiple Jet Idea.

That peculiar compromise, the multiple jet carburetter, apears to have "come to stay," in common with all the more approved forms of mechanism now recognized as permanent features of the average car. Though still found to only a limited extent, its use is still adhered to by so many makers of good repute and of successful practice in other respects, that it seems bound to continue to hold the position it has assumed, if not to grow more popular as time goes on. That it is not more prevalent at the present time is evidence of how near the single jet arrangement can be brought to yielding the desired results. That that type never yet has been absolutely satisfactory, however, also is evidenced by the continual shifting about of designs by even the best established manufacturers.

The conditions so familiar and puzzling to the designer are these: that the carburetter must yield a uniform quality of gas at all times, regardless of any conditions affecting the motor; that in order to do so, its action must be unaffected by the position of the throttle, little if any affected by weather or temperature conditions, and unaffected by minute variations in the density or fluidity of the fuel.

Thus far, the conditions are relatively easy to fulfil. The difficulties of carburetter design hinge about the facts that the suctions of the various cylinders are intermittent, that the cylinders are located at different distances from the mixing chamber, and that the gas requirements vary with both the speed of the crank shaft and the load which is being carried.

Because the engine may be running fast under only a very slight load or no load at all, or very slow under no load or a very heavy load, it is very difficult to standardize the service conditions of the carburetter in such a way that the intermediate points may be met with proper regulation under all possible circumstances. For any single set of coincident requirements, absolutely satisfactory results may be obtained with the ordinary type of plain jet and venturi mixing tube. Outside a limited range on either side of that point, whatever it may be, the compensation now possible must be more or less of a compromise. On this account it is particularly difficult to obtain good results at very low engine speeds with the ordinary carburetter when working on nearly a closed throttle, and also on this account, the introduction of the secondary and auxiliary jet has been deemed expedient.

Tinkering with the Tariff.

It was not the tariff that so quickly built up the automobile industry to its present size in this country. It was the popular fascination of the automobile itself. But the tariff undoubtedly assisted and protected the establishment of American makers by shielding them from the competition of foreign manufacturers enjoying a very much lower cost of labor. Important as this protection has been in the past, it is even more vitally important now, because of the change in the European product to a greater similarity to the American types, resulting in a competition based less on engineering ability and commercial cleverness in discerning the desires of buyers than on beating down the scale of wages to the minimum.

In placing the tariff issue squarely on the basis of comparative wages at home and abroad, the automobile manufacturers have acted with wisdom. The comparison is an absolute and convincing answer to proposals for a reduction.

No complaint can be made of lack of competition among the domestic makers. Every benefit that competition can bring to the public is observable in the industry at the present time, with the one exception that the element of cheap European labor is partially held in check by the import duty. Adequately to meet the difference which this European labor presents in manufacturing cost, the duty should be raised considerably from its present figure of 45 per cent. But the domestic makers do not ask for such an increase, being willing that the tariff should remain as it is, with some corrections in the manner of classification.

The competition among the American manufacturers themselves is bringing the cost of motor cars down to the minimum under which they may be produced while paying the liberal American wage scale. Nothing could be further from the truth than that the automobile business in this country is in the hands of a trust or trusts. There are probably not more than two makers in the United States who have anything like a reciprocal agreement on production or prices, and who are not fighting their battle for existence absolutely alone and against the most lively kind of competition. To have to turn and face cheap European labor as well, is more than enough to occasion dismay.

If public welfare demands that the purchasers of automobiles be supplied with their machines at the low price commensurate with the scale of wages paid to labor in Europe, then it were a sad mistake to have given the domestic manufacturers the tariff encouragement to build their factories and train their men. The lowering of the price to the motor car user would not seem to be quite enough to compensate for reductions in domestic pay rolls and production.

Digitized by Google

Popular impression to the contrary, notwithstanding, the profits of the automobile manufacturers as a whole have been exceedingly small, considering the hazards of the new business, the capital invested, and the energy and enterprise expended. In fact, if the total amount lost in experiments and "dead work" by American manufacturers, including the vast army who have failed and gone out of business, could be arrayed against all the true net profits, it is more than doubtful whether the latter would even equal the former.

While the automobile industry is already very large, yet when compared with other lines of vehicle manufacture it is small, and the possibilities of future expansion are enormous. It is still an "infant industry" in the sense of tariff discussion. If it is to be protected so that it may thrive and grow, there is occasion for rejoicing, but if it is to be exposed to the malady of pauper labor it might best die young. Fortunately, however, an inquiry into tariff conditions does not necessarily mean a reduction in the tariff.

Winter and the Motor Clubs.

In almost every automobile club there are fellows who through inclination or compulsion assume the arduous burden of stimulating the interest and keeping "something doing" with a view to making the organization a success and swelling the membership roll. Heretofore the winter months have loomed up with no more attractive possibilities than "smokers" or discussions on automobile legislation to draw the members together, but latterly there has appeared almost an embarrassment of riches in the things available for attractive winter programs. In fact, winter now seems to offer a season quite equal or superior to summer for the purpose of making an automobile club useful and entertaining to its members.

While comparatively a small proportion of the membership of the clubs can attend the big races like the Vanderbilt and the Grand Prize, when they actually occur, yet they can during the winter months arrange to see these affairs run over for their benefit in the comfort of their own club assembly rooms. The enterprising moving picture concerns have "canned" all the big automobile races, both here and abroad, and "canned" races, if properly served, are not half bad.

With a magic touch the spectator is transported from one place on the course to another, always just in time to see the most exciting incidents and the biggest accidents. Furthermore, after having seen the cars get away from the starting line and having been wafted around to the various points on the circuit where the best views could be obtained, he is returned to his position in front of the grandstand just in time to watch the finish. Had he actually attended the race in person, in all probability he would at that time have been compelled to remain at practically one point, and would have been "shooed" away from the line at the start and finish with a bayonet.

Two or more of the big races can be combined for the one evening. To fill the program to overflowing, the moving picture people themselves have devised automobile race films enacting a thrilling melodrama, which if not convincing is entertaining.

In almost the same class come the illustrated talks describing around-the-world trips, picturesque runs and the like. Some of these have been found much more interesting than they even promised to be. The presence of the car which figured in the adventure shown in the pictures in some cases adds to the effect.

There is a growing willingness on the part of manufacturers to lend good talkers who can hold an audience of motorists in their spell in explaining the construction and merits of particular features of design or construction. Also there are other subjects, like autogenous welding and similar wonders, which lend themselves to platform work and demonstrations. The commercial interests backing some of these things are very glad to have them exploited, and supply all the talent and accessories necessary to make an evening successful. Exhibitions of famous racing or touring trophies can sometimes be arranged, as minor attractions between times.

Where road building has received any attention from a club, there are possibilities in the illustrated expositions on highway construction methods, which experts from governmental sources are glad to give, since it presents an opportunity for them to interest the public in their work. In some instances the chief of police or the mayor may be invited to address the automobilists, and no matter how roundly he intends to score them, he is pretty sure to feel better disposed toward them than before he met them in the pleasant surroundings of the club.

The awarding of prizes for competitions that the club itself may have promoted, such as season mileage or repair cost contests, may properly be put off until some night during the winter, when the award will serve as a good reason for requiring the presence of the members. Local dealers now get their sample cars sufficiently early to exhibit them during the winter, and a series of club room shows, giving each dealer a chance to display and talk about his car, is possible.

Little complaint, therefore, can be made that the clubs having their foundation in motoring must look upon winter as a season for hibernating or for lessening activity. Whether a club be deadly serious or lightly frivolous in its general character and purpose, it can, under the newer order of things, find meat to its liking and on which it will thrive. All that is necessary is a bit of enterprise on the part of those whose duty it is to arrange for the "doings." The present tendency suggests the possibility that before long some shrewd enthusiast will organize a bureau or agency for supplying clubs with the best talent in the classes indicated, to make still easier the task of keeping up club interest in the winter.

COMING EVENTS

December 31-January 7, New York City—American Motor Car Manufacturers' Association's annual show in Grand Central Palace.

January 1, 1909, Los Angeles, Cal.—Automobile Dealers Association's 24 hours race, Ascot Park.

January 1-2—Quaker City Motor Club's two days endurance run, Philadelphia to Wilkes-Barre, Pa., and return.

January 16-23, New York City—Association of Licensed Automobile Manufacturers' annual show, Madison Square Garden.

January 21-31, Los Angeles, Cal.—Automobile Dealers Association's show.

January 27-February 3, Philadelphia, Pa.—Automobile Trade Association's eighth annual show, Second Regiment armory.

February 6-15. Chicago. Ill.—National Association of Automobile Manufacturers' Show, Coliseum and First Regiment Armory.

February 15, Detroit, Mich.—Detroit Automobile Dealers Association's show, Wayne Pavilion.

February 15-20, St. Louis, Mo.—Automobile Manufacturers and Dealers Association's annual show.

March 6-13, Boston, Mass.—Boston Automobile Dealers Association's (Inc.) seventh annual show, Mechanics Building.

RELIABILITY IN A STRENUOUS TEST

Rough Roads and Severe Weather Mark the Worcester Run—Eight Apparently Perfect Scores Made.

As is usually the case with reliability contests in which a technical committee is called upon to decide the scores of the various contestants by a process of minute hair-splitting examination, the final decision regarding the winners of the Worcester Automobile Club's 210 miles run has been delayed. Up to yesterday (Wednesday) the number of actual perfect scores was not yet announced. Eight cars, however, survived the preliminary ordeal and the stresses of the contest itself.

Starting out on the morning of Saturday, the 12th, in a dreary, dull rainfall which turned into a snowstorm and threatened to become a blizzard, fourteen contestants began the contest at 6 a. m. When the competition finished in pitchy darkness that night, the eight successful drivers reported that their scores were to external appearances, perfect. This, of course, did not necessarily mean that all of these would be adjudged absolutely free from penalties at the technical examination. In fact, the chances were that in most cases, the cars which had been put through such a hard, straining test, would have their scores materially chipped. Not only did the technical committee have to investigate the condition of the motors and mechanism, but also to measure various parts of the external portion of the cars, to ascertain if they were at all out of alignment. Various relative distances between wheels, springs and frame were taken and had to be compared with the same set of measurements made in an examination made previous to the start of the run. The contest, to be sure, was a most exacting one, and before many weeks, the exact results will be made known.

The octette who pulled through the entire distance without repairs or adjustments calling for obvious penalizations, were the following:

Ray McNamara, Premier; A. M. Lloyd, American; H. M. Cobe, Lozier; C. S. Carris, Franklin; B. E. Robinson, Rambler; H. E. Wilson, Lozier; A. E. Dennison, Knox; H. J. Murch, Cadillac.

The others, who either dropped out, or were fined to a greater or lesser degree, were:

E. B. Belcher, Berkshire; J. Oswald, Studebaker; George Stowe, White; William Bourque, Knox; E. P. Blake, Jackson; E. W. Williams, Rambler.

The contest was held over five different routes of approximately 42 miles each, beginning and ending at Worcester. Thus as the entire contest radiated from Worcester, local persons who were interested in the affair were enabled to get the returns and news of the run at the close of each lap. The five courses were laid out so as to include the worst roads around Worcester and the contest committee made all arrangements possible to make the run a strenuous one. As a whole, the cars performed remarkably well and the drivers did good work and clever driving, the breakdowns and penalizations that occurred being due to the snow and slippery road conditions, rather than to mechanical defects in the cars.

Of the six who met with trouble on the run, William Bourque, driving the Vanderbilt Cup Knox car, was the first to withdraw. On the second lap, while trying to avoid the American Gadabout which was skidding down hill on slippery pavement, Bourque ran his mount into a ditch, smashing a mudguard and stalling his motor. On the next round, his hoo-doo continued to follow him and after breaking his valve gear, he withdrew.

E. P. Blake, at the wheel of a Jackson, was the next to come to grief. He was passing Holden, on his way to Princeton, when on a turn in an ice-covered stretch, his car began to slew "around, around, around." After making three complete revolutions, it crashed into a woodpile and upset, throwing the passengers out into the snow. None was hurt to any extent, but a broken axle ended the car's usefulness. At Quinapoxet, E. W. Williams had the misfortune to go out with rear axle trouble, and at North Brookfield, George Stowe, driving the White entry, the only steamer in the contest, broke a piston rod and began to slide down hill backwards. Several other drivers had to scurry out of the car's way to avoid being hit.

One of the hard luck stories of the day was that of J. Oswald, the Studebaker pilot, who suffered a penalization because his gasolene supply gave out and made him late at a control. The Berkshire car was another to meet with trouble on one of the hills. When it failed to get sufficient traction to carry it to the summit of one of the steep grades on the last run, its passengers got out and pushed and this spoiled the car's otherwise perfect score.

Among those who were more fortunate in not meeting with breakdowns on the road, were some of the veteran drivers. Ray McNamara, who was the "pathfinder" of the Glidden tour, carried the Premier through in good shape; C. S. Carris, who has piloted the Franklin to victory in so many competitions, sent the little air-cooled car over the ground to the queen's taste, while Al. Dennison, in the second Knox entry, had better luck than his team-mate, Bourque. Harry M. Cobe, who has distinguished himself in 24 hours races, came very near getting arrested when he started out to beat the rest of the field to the controls. He drove as though he were in a race and only let up in his grandstand play when warned by the Worcester chief of police to stop. Wilson, who handled the second Lozier, was another among the leaders. A. M. Lloyd, in the American "Gadabout"—that car with the new name, and Birney Robinson, in the Rambler, pulled through without difficulty, while Harry Muren, in the little Cadillac, kept up with the high-priced cars, as far as

H. J. MURCH, CADILLAC

while Harry Murch, in the little Cadillac, kept up with the high priced cars, as far as good going was concerned.

Some of the drivers lost their way shortly after the start, which was made in the dark at 6 a. m. They had climbed Dead Horse hill without any trouble and had passed through Spencer, when several failed to follow the confetti and took the beaten path toward Oakham. These went three or four miles out of their way before they discovered the mistake. All managed to make up time, however, and reached the 8 o'clock control at Worcester on schedule time.

The second flyer of the contest went over a route through Holden to Hubbardston and back, and the third, or last run of the forenoon, was through Princeton, Sterling and Boylston, a distance of 37½ miles, with 1 hour 45 minutes allotted to cover it. A rest of an hour was given at noon for luncheon and the contestants then set out through Trowbridgeville, Oxford, Webster, Douglas, Wilkinsonville and Millbury. This was the hardest trip of the day and for a while it was feared that the cars would not reach the control on time, but most of them succeeded in doing so. The last lap was the longest of any, 46½ miles. It took the cars out through Paxton, Coldbrook Springs, Oakham and back via North Brookfield, Spencer and Leicester, 1 hour and 15 minutes being the time allowed. By this time several of the drivers were commencing to feel the effects of the extreme cold and were glad when the contest was over that they might get a chance to thaw out.

It was originally intended that the technical examination should be made immediately after the cars checked in for the last time, but it was deemed advisable at the last minute, to wait until daylight. Upon the unanimous consent of all contestants, the clutch, brake and transmission tests, which were to have been made at the close, were eliminated. Distinguished talent was arrayed for the examination of the cars in Charles M. Allen, D. L. Gallup, and J. C. Harvey—all from the Worcester Polytechnic Institute.

C. S. CARRIS, FRANKLIN

B. E. ROBINSON, RAMBLER

Chattanooga Man Agitating for a Race.

Having heard such glowing tales of the success of the Grand Prize race at Savannah, Randolph M. Rose, a citizen of Chattanooga, Tenn., is highly enthusiastic about holding an automobile race in his own city and expects to promote one. He is confident that a much better course can be built around Chattanooga and believes that a big road contest can be gotten up that will equal, if not eclipse Savannah in importance. While a race of these dimensions would be quite an undertaking, there are numerous citizens of Chattanooga who join Rose in his enthusiasm.

TAME CIRCUS AT TANFORAN PARK

Seyfried Makes Oldfield-Christie-Soules Troupe "Look Like Thirty Cents"—But Barney Wins Sweepstakes.

A crowd estimated at 10,000 persons swarmed to Tanforan Park, San Francisco, Cal., on Sunday, 6th inst., to see an automobile race meet in which sensations and thrills were expected in abundance and was compelled to witness one of the tamest, milk-and-water style of automobile meets ever held in the country. The affair was held under the auspices of the Automobile Dealers Association and proved to be a futile attempt composed chiefly of circus acts and "exhibition" events, the element of competition lacking throughout. There were few entries to begin with and for this reason, half of the proposed program was omitted. Of the crowds that packed the grandstand and paddock at the start, fully half went away early, disgusted with the meet and the management.

Apparently the trackfest was held for the benefit of that trio, Oldfield, Christie and Soules, whose performances were to constitute the features of the day. When E. A. Moross, manager of this outfit went to San Francisco some days before the race to arrange his entries, he wanted to have a sweepstakes event gotten up for a $2,000 purse and have the event open only to the hippodrome company mentioned above. This would guarantee good sport, he assured the promoters, for there would be the keenest competition between Oldfield, Christie and Soules to gain that $2,000. No outside entries would be needed to make the race a crackerjack. But some of the local dealers could not see things this way. Some of them had doubtless been studying the adventures of the "Noble Three" during the past few weeks, and the San Franciscans who have a few speedy cars of their own, refused to let Moross have his way. After a couple of dealers who desired to enter cars in this event told the "Noble Three" that they were circus performers, Oldfield agreed to let C. A. Hawkins enter a White steamer, and Frank Free a Comet.

While it was the misfortune of the White entry to catch fire in the sweepstakes, Oldfield may have wished that the car had burned up altogether, for it caused him to "sing small," when, with Gus Seyfried at the wheel, it covered a mile in 59 seconds flat, while the best that Oldfield could do was 1:03. Seyfried's time was the fastest ever made on that track, and beat the former record of Oldfield considerably.

The opening event, scheduled as a five miles contest for cars costing $2,000 and under, saw only one starter, a White steamer. The second event, for the $4,000 class, was also a case of "all White"; two cars of that make being entered, and a single Buick the only other competitor. Don Whalley drove the winning steamer 3 miles in 3:24, while Seyfried in the other White was second.

Then came four not over exciting exhibition events, during which Seyfried made his 0:59 mark. The best Free and Soules could do was 1:05, and the annoyed Oldfield, 1:03, as before stated. The Christie car, with G. H. Hughes at the wheel, cracked a cylinder and could make no showing in the contest.

In the sweepstakes, Oldfield hesitated about meeting Seyfried in a preliminary heat, so he made Moross stack him and his six-cylinder car up against Free in the little Comet, and, of course, Oldfield took the heat. When Soules and Seyfried went at their trial, Seyfried's pilot light went wrong and flames caused him to drop out. That left the final 5 miles heat to Soules and Oldfield, with the usual result. Soules, as a matter of course, let the star win by a good safe margin in 5:21.

What promised to be a good brush between J. Seeley in a Peerless and a Packard car, fell flat, when the latter withdrew in the third mile. The only semblance of excitement was furnished in the final 5 miles handicap. Moross was the handicapper and some of the contestants did not like his system, Hawkins withdrawing his White and claiming that he did not receive a fair start. Two Comets, driven respectively by Earl Cooper (45 sec.) and Frank Free (10 sec.); Frank Murray in a Buick (60 sec.), and a Stearns, fought the race out, Cooper winning in 6:20, with Free second. Then what was left of the crowd trailed homeward, sighing for the days of old when horses used to gallop around that dusty track, in real contests.

The summaries:

Three miles, stock cars costing $4,000 or less (stripped)—Won by Don Whalley, White steamer; second, Gus Seyfried, White; third, Frank Murray. Time, 3:24.

Exhibition mile by Frank Free, Comet Time, 1:05.

Exhibition mile by Charles Soules, Stearns. Time, 1:05.

Exhibition mile by Gus Seyfried, White Flyer. Time, 0:59.

Exhibition mile by Barney Oldfield, 6 cylinder Stearns. Time, 1:03.

"Sweepstakes" event—First heat, 3 miles, won by Oldfield; second, Frank Free, Comet. Time, 3:05⅘.

Second heat, 5 miles—Won by Charles Soules; Seyfried, White Flyer, did not finish. Time, 5:26.

Final heat, 5 miles—Won by Oldfield; second, Soules. Time, 5:21.

Three miles, fully equipped touring cars—Won by G. H. Seeley, Peerless. George Hoff, Packard, did not finish.

Five miles, free-for-all handicap—Won by E. P. Cooper, Comet (45 sec.); second, Frank Free, Comet (10 sec.); third, Frank Murphy (60 sec.); fourth, Charles Soules (scratch). Time, 6:20.

MAY BOYCOTT THE GRAND PRIX

Reported Agreement of Prominent Foreign Makers Not to Enter the Contest—Surmises Concerning the Reason.

Though the Paris Salon is proving practically barren of sensations in the mechanical sense, it has brought forth one announcement which is sufficient in itself to cause the promoters and patrons of the great foreign racing events to catch their breaths in dismay. Directly after the opening of the Salon it was announced that no less than eleven manufacturers of prominence had signed an agreement boycotting the Grand Prix race of 1909. Of these, seven are French, two German and two Italian. While no cause has as yet been assigned for this alleged action, it is suggested that with the restrictions already decided upon for the forthcoming contest, that is to say, a reduction of the bore limit to 130 millimeters, the feeling is that the results of entering would not justify the expense, or, in other words, that without the possibility of using huge engines, the foreign builders hesitate about trying their strength in a competition with the manufacturers of the world at large, the results of which would be so universally studied.

The names connected with the announcement were those of the Panhard, Renault, Peugeot, Lorraine-De Dietrich, Bayard-Clement, Brasier and Darracq makers of France; Mercedes and Benz, of Germany; and Itala and Fiat, of Italy. While in some quarters it was stated that all of these firms had agreed to withhold their support of the 1909 Grand Prix, it was affirmed elsewhere that only five of the above named had actually signed the agreement. Furthermore, as some of those connected with the firms in question were active in framing the new racing rules, and as the typical European fickleness has before given rise to such announcements as that some of these firms were not going to exhibit at the Salon, which afterward were ignored completely, the seriousness of the situation is regarded as being somewhat tempered. It is, however, another instance of the wavering condition of the European industry at the present time.

New Year's Run for Ford Owners.

Following the custom of two previous winters, the Chicago branch of the Ford company will hold a New Year's Day run over the Chicago-Elgin-Aurora course. While this run has been for Ford owners exclusively in the past, this year members of the Chicago Automobile Club will be invited to join in the outing regardless of what make of cars they drive. At 10 p. m. on December 31, a dinner of the entrants will take place at the C. A. C. club house and promptly on the stroke of twelve, the motors will be cranked and the cars will start westward on their first run for the year 1909.

BEAUDETTE BAGS MOST HONORS

He Makes Fastest Time at Los Angeles Hill Climb and Captures Three Events—Dingley Twice a Winner.

Preceding a cloud of angry steam, T. J. Beaudette mounted in a Stanley car, shot up the mile course with its 18 per cent. grade at Riverside, Cal., on Saturday, 5th inst., and made the fastest time at the annual hill climb of the Los Angeles Automobile Dealers Association. He covered the distance in 1:12, which was better than any of the gasolene machines could do, Bert Dingley being the nearest competitor with a Chalmers-Detroit in 1:20. Everybody expected Beaudette, who had the only steam car, to win and the real contest was between the other drivers. Owing to a scarcity of entries, and particularly those of high-powered cars, a considerable portion of the program was omitted. This was due largely to the fact that the contest was postponed from Thanksgiving Day, the originally scheduled date and interest in the event was somewhat lacking. Two thousand or more spectators turned out to watch the sport and had an opportunity to see one or two thrills at the turn about the middle of the course alarmingly known as "Death Dip."

In the gasolene class, Bert Dingley, with the Chalmers-Detroit, and Frank Siefert at the wheel of a Stoddard-Dayton, were the favorites, and the interest of the spectators centered chiefly in this pair. When they got ready to fight things out in the $2,000-$3,000 class, Siefert tore up the hill at a hot pace and when the timers announced 1:22⅗, which was better than the earlier performance of the steamer, the Stoddard-Dayton rooters went wild with joy. This exuberance of spirits, however, was short-lived, for Dingley got his motor firing and plunged up the elevation to the tune of 1:20⅕, taking a long, dangerous chance in not throttling down ot the turn. Then the crowd applauded Dingley. In this event, C. A. Cowan was third with his Rambler in 1:38.

Dingley and Siefert went at it again in the free-for-all roadster event, Dingley winning for the second time in 1:20⅗, slightly slower than his first trial. Siefert got second place in 1:22⅖, one-fifth of a second better than his first attempt. Cowan got third place, with L. B. Harvey fourth.

Of the lighter gasolene cars, the best showing was made by George Kussman with a 22 horsepower Tourist in the $1,500 and $2,000 events, both of which were won by Beaudette with his steamer. In the former, Kussman's time was 1:48⅗ against the steamer's 1:24⅕, and in the latter the Tourist covered the distance in 1:42⅖, as opposed to Burdette's 1:12—the fastest of the day. L. B. Harvey was third in this with a Rambler in 1:50.

William Foberth captured the $2,500-$3,000 touring car event, in which each contestant had to carry a load of five passengers. He made the ascent in the good time of 1:25, Beaudette's Stanley steamer breaking down and failing to finish. The latter, however, made off with the event confined to the fastest cars in each of the other events, Siefert scoring second with the Stoddard-Dayton, and Dingley third, with the Chalmers.

The summaries:

Touring cars, $1,000 to $1,500, four passengers—Won by T. F. Beaudette, Stanley steamer; time 1:24⅕; second, George Kussman, Tourist, 1:48⅗.

Roadsters, $1,000 to $2,000, two passengers—Won by T. F. Beaudette, Stanley steamer, 1:12; second, Kussman, Tourist, 1:42⅖; third, L. B. Harvey, Rambler, 1:22⅗.

Roadsters, $2,000 to $3,000—Won by Bert Dingley, Chalmers-Detroit, 1:20⅕; second, Frank Siefert, Stoddard-Dayton, 1:22⅗; third, C. A. Cowan, Rambler, 1:38.

Roadsters, free-for-all—Won by Dingley, 1:20⅗; second, Siefert, 1:22⅖; third, Cowan, Rambler, 1:33; fourth Harvey, Rambler, 1:46⅖.

One mile exhibition, by T. F. Beaudette, Stanley steamer. Time, 1:18⅖.

Touring cars, $2,500 to $3,000, five passengers—Won by William Foberth, 1:25.

Special event for fastest cars in preceding events—Won by Beaudette, 1:18; second, Siefert, 1:22⅖; third, Dingley, 1:24⅕.

Los Angeles Cards a 24 Hours Race.

Following the consummation of the deal to turn Ascot Park, Los Angeles, Cal., into a motor racing track exclusively, comes the announcement that provided the course can be put into proper condition by the latter part of this month, a 24 hours race will be the opening event of the new autodrome, starting New Year's eve. The contest will be held under the auspices of the Automobile Dealers Association, the organization that expects to have direct charge of all future speed contests at this course. It is planned to make a cement track of the old horse track ultimately, but for the New Year's Day affair, merely the turns at each end will be banked with concrete to permit high speed.

Providence Talks of a Motordrome.

Plans are under way to build another cement motordrome. Narragansett Park, Providence, R. I., will shortly be transformed from a horse track, into a banked course for the exclusive use of automobiles, if the arrangements of the corporation which now owns the track do not fall through. Frederick E. Perkins, president, and Albert H. Moore, secretary, want to spend $50,000 on the venture and bank the turns to a height of 25 feet, believing that if such a course could be made safe for speed contests, the enterprise would prove a paying one. The fact that horse racing is practically barred in Rhode Island by law, has led the park owners to favor the idea.

PRESENTATION OF THE GRAND PRIZE

The Golden Trophy Formally Handed Over and Accepted—Mayor Tiedeman, of Savannah, Assists in Ceremonies.

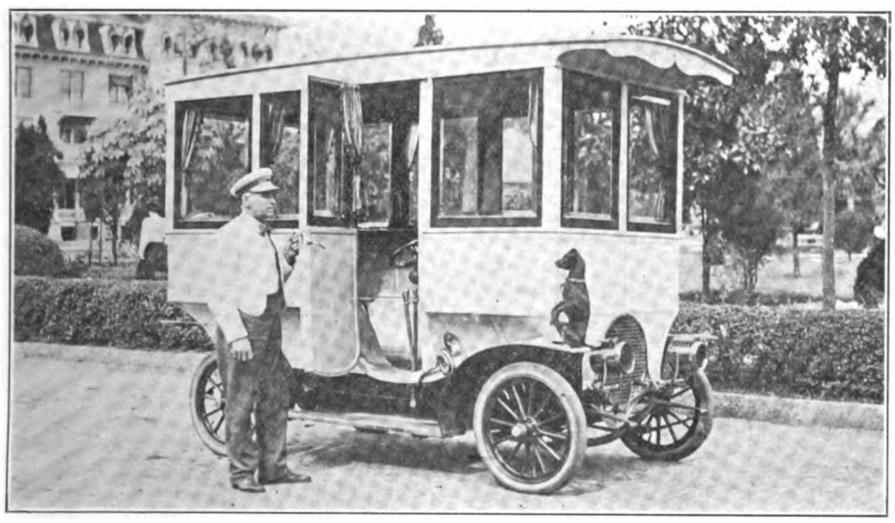
More than two hundred members and guests of the Automobile Club of America waited patiently for several hours on Tuesday evening last, for the arrival of Judge E. H. Gary, president of the club, who was to present the grand prize to the representative of the Fiat Automobile Co., whose car, driven by Louis Wagner, won the Grand Prize race at Savannah on Thanksgiving Day. But the Judge failed to appear and Robert Lee Morrell, chairman of the contest committee did the honors. In beginning his presentation speech, Mr. Morrell was modest and did not want to mount the platform, but the guests insisted upon it, that they might get a good view of him, and after making a few remarks about the race, praising the people of Savannah and those connected with the southern club who helped make the affair a grand success and likewise praising E. R. Hollander, of the Fiat Company, the speaker presented the trophy. Mr. Hollander, who accepted it in behalf of the company he represented, expressed his thanks amid loud applause.

Among the guests were Mayor Tiedeman, of Savannah; Frank C. Battey, president of the Savannah Automobile Club; Harvey Granger, W. B. Stillwell and William Lattimore, who made the trip from Georgia especially for the occasion, all of whom made addresses. Stereopticon views and moving pictures of the race were shown.

Planning a New York to Seattle Race.

Officials of the Alaska-Yukon-Pacific exposition, to be held at Seattle, Wash., next year, have commenced to agitate a transcontinental race for next summer. Application has been made to Robert Guggenheim, of New York, to use his efforts as a director of the Automobile Club of America, to stir interest in a race from New York to Seattle. Guggenheim, who was interested in the Elkwood Park meet July 4th last, is said to have expressed his willingness to comply with the request, and has announced that he will enter an American car should such a contest materialize. He has even gone as far as to say that the race will be promoted by Thomas Francis Moore,—who disclaims all knowledge of it—and that Wm. K. Vanderbilt, Jr., will act as official starter.

Motoring Grows Popular in Monterey.



With gasolene selling at $4.20 for a five-gallon can in their city, the residents of Monterey, Mexico, would hardly be expected to be enthusiastic in taking up motoring, but despite this drawback the number of owners is constantly increasing.

HIS CAR A HOME AND WORKSHOP

Razor Man Lives, Toils and Travels on "The Sharp Edge"—That is What He Calls His Novel Vehicle.

Combination three-in-one folding bed, bath-tub and piano contraptions have been placed on the market by house furnishing manufacturers occasionally during the last decade, but one of the most interesting "combination" outfits ever built is that of N. H. La Grand, of Jacksonville, Fla., who has a modern adaptation of the house car principle that is about equivalent to a residence and office building on wheels. Working on the theory that it is "cheaper to move than pay rent," La Grand has made of his car a place of business and temporary abode, and he explains that within a few seconds he can change it successively into a working car, a dining car, a sleeping and a touring car.

RAZOR MAN AND HIS HOME, "THE SHARP EDGE"

Taking a Franklin chassis, La Grand built upon it a car body suited to his purposes, doing the work himself and spending upon it half of his time each day for 15 months. Completed, the vehicle weighs only 2,300 pounds, and the cost has been $3,664.98. A general idea of the car's appearance is given by the accompanying illustration, showing the man and his novel home.

In constructing this vehicle, La Grand did not confine himself to conventional design in the least. As will be noticed, the body is made to run the full length of the chassis, while it also overhangs to the full width of the tread. It carries large convenient lockers and a refrigerator and the interior decoration with its maple and mahogany finish has something of the effect of a Pullman sleeper. The windows are of beveled plate glass, the curtains of green silk. It is fitted with electric lights throughout and is a most up-to-date piece of craftsmanship. The designer, who is in the razor business, calls his car "The Sharp Edge," which he thinks is a most appropriate title.

Motor Car Delivery for Detroit Suburbs.

Two Wyandotte (Mich.) men have embarked upon an enterprise to run a suburban motor car service between Detroit and towns as for north as Trenton, the idea being to cater to the trade of merchants along the line. When the plan gets into smooth running order, it is the intention of the promoters to have three fast motor car deliveries daily, carrying goods from the concern's depot in Detroit direct to the door of retail business men. The advantageous feature of the line will be that dealers in the various towns can get rush orders delivered with great promptness, by telephoning for same to Detroit. One car has already been ordered and the company will probably start the business in operation about January 1.

Automobile Doubles Stage Line Traffic.

In view of the fact that Rhodes Bros., of Paoli, Ky., believe an automobile can do twice the work of several horses, they have made application to the authorities to change the schedule of their stage line betwen Paoli and New Albany,, Ky., so that a round trip can be made daily between the two places, instead of the present single trip. They intend to discontinue the use of horses and instal a motor car and also to establish another motor line between New Albany and Corydon, a distance of 20 miles, making two trips a day.

Taxi Service Profitable in Boston.

The Taxi Service Co., of Boston, Mass., is so pleased with the prospects of the taximeter cab business in the Hub that it has increased its capitalization. The increase is from $120,000 to $350,000, and precedes the issuance of $40,000 additional common stock and $190,000 preferred.

ANOTHER CLAIM TO PIONEERSHIP

Boston Bobs up with Elijah Ware's Steam Automobile, Produced in 1861—Its Construction and Achievements.

One more has been added to the already large family of those who claim to be the original inventors of the motor car. Inventors of this sort are about as numerous as the many surviving members of the "original Florodora sextette." It has just been recalled that Elijah Ware, of Boston, Mass., a well known railroad construction engineer in his time, invented a steam automobile as early as 1861 and ran it on the streets of Boston.

According to persons who recall it, the car ran remarkably well for such an early attempt and the fact that at one time Elijah used to race his invention against race horses on the old plank road near Bayonne, N. J., where he lived for a while, is evidence that he must have been able to cover some little distance at creditable speed. It was while he was in charge of the temporary repair shop for steam shovels in Boston, during the filling-in of the Back Bay, that Ware decided he wanted a horseless carriage and constructed a clumsy four-wheeled affair, with a vertical boiler and oscillating engine of small horsepower. The car was steered with a wheel and steering post, and the ordinary carriage shoes acting on the solid tires answered the purpose of brakes. The car ultimately was sold for $300 to a clergyman who lived in Prince Edward Island, who is said to have become quite an automobile enthusiast.

Schools for Military Motor Car Drivers.

Schools for motor car drivers recently have been organized by the Spanish military authorities in connection with several regiments, with the object of developing a corps of skilled operators who are members of the military. The schools are said to be well equipped in the way of machine tools and other facilities necessary to the performance of extended repairs and are conducted under the auspices of the Central Electrical School. A corps of motor volunteers also has been organized by the Spanish Royal Automobile Club.

Newark Club Planning a Metallic Garage.

The New Jersey Automobile and Motor Club is considering the plan of building a metal garage in Newark, N. J., in place of the half-completed frame one, upon which work was stopped recently. The original scheme of constructing a wooden garage was carried forward enthusiastically until the Bureau of Combustibles and Fire Risks announced that it would not permit the storage of automobiles in such a building in a congested part of the city. That put a stop to the proceedings.

PROBLEMS OF AUTOMOBILE REPAIR

How They Trouble the Carriage Maker Who Undertakes the Work—One of Them Specifies the Difficulties.

That it is practically impossible to forecast the amount of expenditure which will incident to the upkeep of a commercial car, that it cannot even be run along strictly "business lines," is the deduction which an exponent of the carriage trade makes on the basis of current practice. That these unhappy conditions are likely to be ameliorated in process of time, he does not acknowledge in his treatment of the problem of motor car repairing as presented to the carriage builder. Another of the drawbacks of the automobile business in its present stages which he touches upon with some little melancholy is the commission evil. In this connection, he points out that the "regular 'auto' repairers allow this amount (5 to 10 per cent.)" by adding it to the owner's bill, and so long as the owners are willing to stand for the imposition, he fails to see why the carriage men should hesitate to fall in line. Discussing the matter further, he says:

"Since the advent of the automobile for pleasure driving and business purposes, also since the introduction of the commercial truck into the every-day business sphere for transportation, many very unsatisfactory features have been connected with the various repairs of cars and trucks. The diversity of the work and the different problems which present themselves almost on every job to be repaired has been one of the most difficult problems to solve in the repair departments of the various carriage and wagon shops.

"That they cannot be run on strictly business lines, and that their real cost of repair cannot be calculated in advance, as is done with other well tried work, is an insurmountable drawback to the carriage and wagon builders and their customers. In the first place the automobile user will not and cannot wait as long as demanded by the repairer. On the other hand, the carriage and wagon builders having been connected with new work and its repair, and their long association with this business where the carriage or wagon is left in the shop as a matter of course as long as needed, for a thorough repair, has malfitted them for automobile work which must be done quickly, and for which the regular automobile repairer is better fitted to do such work, because he is taking advantage of minor details, which saves time and money, and which the carriage and wagon builder has not yet acquired.

"Beyond question the repair of horseless carriages and truck work, also the repair of the machines, is of the most importance to the carriage and wagon builders. It is a real question of merit to pay considerable attention to this part of the business as a source of revenue. It is of a profitable nature, and when operated and managed on business principles in connection with the wants and the necessary condition of the present times, repairing the horseless carriages, wagons and trucks as an adjunct to the other departments, if managed properly, is profitable. The other question, "how much is in it?" for the chauffeur when running up to the carriage repair shop can be best solved by adding a certain percentage to the repair item, which, of course, the owner must pay as long as he allows his chauffeur to exact a certain percentage on the cost of repair to go in his pocket. This one question has been a source of dissatisfaction, and many carriage and wagon builders will not stoop to such practices, and have lost a great deal of repair work which would have been theirs had they allowed 5 or 10 per cent. of its cost to the chauffeur to keep in good relation with him. The regular automobile repairers allow this amount, and as they do the work in almost half the time that the carriage and wagon builders require, the excuse is the short time it can be done, is one of the best possible reasons why the repairers are doing the work, and all are busy, while the carriage and wagon builders are waiting for something else to turn up in their shops since the introduction of the horseless vehicles.

"The repairers, who are generally agents of several automobile manufacturers, of course take considerable pains to hold the patronage of all automobile owners who come along, or who have their machines stored at their garages. It is a matter of business on the part of the repairer and garage owner who has one or several good machines which he handles, sells and repairs, to keep in close touch with the owners. By this means the owners of the automobile, being one of the ones he sells, and with which the mechanics in the repair shops are thoroughly familiar, are well fitted for the repair of the machines, which puts the carriage and wagon builders greatly to a disadvantage unles they hire a competent mechanic to do this work; but the carriage and wagon builders again have the advantage over the repairer by doing the repair body work, painting and trimming far more thoroughly and of a far more satisfactory nature than the repairer can. He has not the facilities nor, generally speaking, the experienced mechanics, which the carriage and wagon builders have and need to do the new work.

"The result of this is, if the repair work is handled with sufficient tact and business enterprise, all these shortcomings above related to can be bridged over satisfactorily. The repair work in automobile bodies has been extensive and of almost infinite variety. The bodies have been lengthened, cut in half, and another seat added, replaced with any variety of tops with which the carriage mechanic is thoroughly familiar."

AUTOMOBILES SAVE FOR FARMERS

Colorado Agriculturist Shows by Figures Their Economical Value—More Efficient and Cheaper than Horses.

What economy results from keeping an automobile instead of a team of horses on a country estate is given in a demonstration by figures prepared by T. H. Proske, whose home is near Denver, Col. Some time ago he decided that as a substitute for the family carriage, used chiefly between farm and city, he would thoroughly test the motor car. The test he made a matter of bookkeeping. Buying his automobile, he made a record of its upkeep for about 18 months. This record, with the original cost of the vehicle, is as follows:

One set of tires	$130.00
Less credit for old one taken in exchange	35.00
	$95.00
One overhauling and varnishing	35.00
Average cost of gasoline, oil and batteries per month, $12—18 months	216.00
Original cost of motor car	3,040.00
Total	$3,386.00

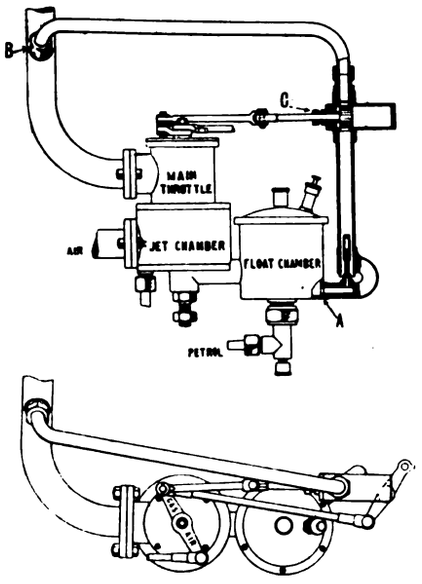
This is based on a daily average travel of 35 miles, running with his 28 horsepower Franklin. Later he decided to buy a 42 horsepower machine of the same make. He finally sold the original car at the end of the 18 months for $2,250, thus bringing the net cost down to $1,136, or a little more than 5 cents for every mile traveled.

Satisfied that the original cost of horses and carriages to do the same amount of travel would exceed the original cost of the automobile, Proske figures the upkeep for horses and coachman as follows:

Feed for two horses, per month $35—18 months	$630.00
Coachman, boarding himself, per months, $75—18 months	1,350.00
Total	$1,980.00

"This," he remarks, "is not making any allowance for repairs to carriages or depreciation or possible death of horses. It will be seen from this that even if there was no sickness or death of horses and no depreciation in equipment I am still $844 ahead on the deal." This result is reached by deducting from the $1,980, which maintenance of a carriage would cost, the $1,136 which the automobile actually cost for 18 months. Incidentally the second experiment developed the fact that the upkeep cost of the second and larger car exceeded that of the first by not more than 10 per cent.

Another Ajax Girl Appears.



Another "Ajax" girl has made her debut, quite as beautiful as her predecessors. She is fathered by the Ajax-Grieb Rubber Co., of New York, and is a herald of the 1909 season for Ajax tires.

NEW DEPARTURE IN CARBURETTERS

"Pilotjet" Affords the Advantages of Multiple Jet Type—The Device Attachable to Any Existing Design.

So much difficulty has been found in securing a method of carburetter regulation which shall permit of equally good results regardless of whether the motor is running slow or fast under load, or slow or fast without load, that many designers have had recourse to the simple expedient of duplication, so to speak, or in other words, to the adoption of the multiple jet type of carburetter, in which the several distinct-

ive conditions of service are catered to independently. So great have been the benefits derived in this way that a firm of British manufacturers, Messrs. W. H. Bailey & Co., Ltd., Albion Works, Salford, have devised a system for modifying the ordinary type of single jet carburetter by the addition of a secondary jet and mixer system which under suitable throttle control may be brought into action to supplement the work of the main jet at times when its natural characteristics fail to yield the desired service to the motor.

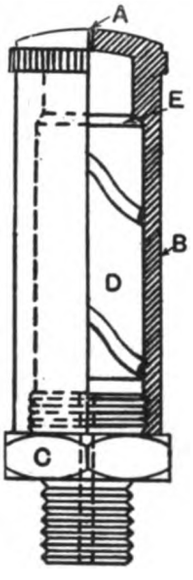
As will be noted from the accompanying plan and elevation outlines of the device, it is simple, readily attached, and in no way different in principle from the ordinary simple types of single jet carburetter. The arrangement is known as the "Pilotjet," and may be fitted to many present types of carburetter by simply tapping the intake manifold for one connection and the float chamber for another, the mechanism of control being even more readily attached. The resulting contrivance is a complete dual carburetter with the smaller of the two jets intended to serve only for slow and light load running.

In the accompanying illustration it is shown attached to a carburetter of the Longuemere type. The connection made at A, with the float chamber, serves as the fuel supply to a small jet located at the base of a small, straight, mixing tube, with a fixed air inlet. This tube leads directly to the main intake manifold connection, at B, and obviously serves to by-pass that leader when the main throttle is closed. When running under full throttle opening, however, the by-pass arrangement is cut out to afford the benefit of full suction to the main jet. To permit this, and also to allow for uniform gradations of speed and power from the idle-running to the full load, full speed, conditions, a piston throttle, C, is provided in the by-pass tube itself, and is interconnected with the main system of throttle control by the simple leverage and linkage shown. Additional permanent regulation also is permitted the auxiliary throttle so that when the main throttle is closed, it will stand at a point which will just permit the engine to turn over smoothly without gagging or missing explosions.

The design of the arrangement has been so carefully carried out that it is claimed the engine may be jumped directly from the slow, idle condition to full speed without staggering or missing, while the ordinary conditions of road running are in no way affected by the additional mechanism. The most commendable feature of the system, it would appear, is that it is available to the owner of a car equipped with a faulty carburetter, who does not care to go to the expense and risk of trying various new carburetters supposed to remedy the difficulties and who yet is desirous of bettering the ordinary performance of the motor.

Long Road Trip to Test Tires.

In order to make various tire tests on a long road trip, which would not be possible in or about a factory, and equipped with instruments for studying the temperatures created in tires at various speeds ranging from 25 to 60 miles per hour, as well as other technical points, Joseph M. Gilbert and James Patterson of the Continental Caoutchouc Co., started on a trip from New York City to Buffalo and return, on Saturday, December 12, in a specially equipped car fitted with their tires.



In addition to heat data, an effort will be made to ascertain the expansion of tires under service over a route of 1,000 miles, and also to determine the amount of air lost from tires through road contact. It is a well known fact that while a tire may look all right to the eye under certain circumstances, it may be shy some 25 pounds of air pressure, owing to the loss of vitality of the air. The trip will doubtless afford ample opportunity for the study of technical weaknesses of tires by the investigators.

That the 1909 Franklin engine is capable of delivering at the rear wheels 93 per cent. of its developed power, is claimed by its makers. This has been demonstrated by a series of tests made at the Syracuse factory.

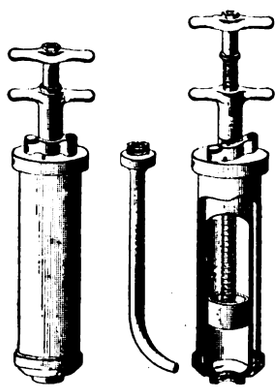
JET WITH A ROTARY PLUNGER

Peculiar Adaptation of the Whirling Spray Idea to the Atomization of Fuel—Construction of the Appliance.

Unlimited schemes have been advanced for the improvement of the ordinary type of carburetter, as well as for the development of types depending on principles which are wholly or partially new. In this connection, no little stress has been laid on the performance of the common form of plain jet, which, it is fully admitted, does not always yield the direct and readily responsive

flow which is required. Another failing of the plain jet is that if large enough to furnish a full delivery to the motor when full load and speed conditions obtain, it tends when subjected to conditions of lower speed and lighter load, to yield a spasmodic or "lumpy" flow of fuel. To remedy this, a recent British invention has been introduced which follows the analogy of the mixing wheel or vaporizer which has been applied more than once to mixing chamber construction.

The detailed construction of the device is made plain by the picture in which A-C represents the body portion of the jet; E, a recess in its upper portion, and D, the rotry plunger, which, it may be observed, is capable of a slight longitudinal, as well as rotary motion. The jet opening to the mixing chamber is at A, in the center.



It is claimed by the makers, who are Messrs. S. de Beer, that several rather unexpected attributes are developed by the use of the jet. Not simply is the flow of fuel so well regulated that smooth running qualities otherwise undeveloped may be secured, but that the power and rate of acceleration is considerably improved, while the amount of fuel consumed per horsepower output at the fly wheel also is noticeably reduced.

NOVELTY IN GREASE GUN DESIGN

The "Tuckahoe" Distinguished by a Cylinder within a Cylinder—Charging Requires Only Three Motions.

However effective it may be in other respects, and however well made and nicely polished, the average grease gun is a dirty thing to handle, because it is practically impossible to fill it without soiling the hands. That this operation also is sometimes accompanied by the mixing of small amounts of grit with the lubricant is an even more valid objection. In the new "Tuckahoe" grease gun both of these objections are eliminated by the adaptation of

a principle suggestive of that of the familiar "students lamp." In other words, there are two concentric cylinders, the outer of which serves merely as a retaining shell which may be kept clean at all times, and which never is inserted in the grease pot. The inner cylinder, in which the piston slides, is removable from the body of the device, and may then be plunged bodily into the grease.

When this is done it is completely filled at a single operation, and may be at once replaced in the outer cylinder, when the device is ready for use. The outer and inner parts, the former carrying the nozzle and the latter the working cylinder, are secured together by a screw attachment which is released by giving the handles a third of a turn. The plunger stem is threaded and engages a nut latch at the top thereby providing ample power for discharging even a very stiff compound through the nozzle. By releasing the latch, the plunger may be moved freely in the cylinder, this being useful in filling the receptacle, or in handling oils. As the gun is designed for use with either oil or grease, two separate nozzles of different size are provided. The device has just been put on the market by the Rubly Mfg. Co., Tuckahoe, N. Y.

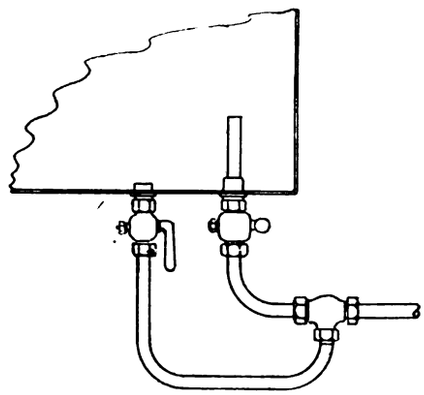
Safeguarding Car in Hill Stops.

Cautious drivers who are forced to stop their cars on a sloping or hilly bit of road will do well to leave them standing with the front wheels slightly "cramped" so that should the machine be started with no guiding hand at the wheel, its course would be checked almost at once by the curbing or gutter. Although the ordinary forms of emergency brake are adequate to hold the machine under all ordinary circumstances there is considerable danger of their being released suddenly and even without outside interference when the teeth of the ratchet are worn, while there always is the peril of the inquisitive bystander who is overwhelmed with a desire to pull a lever or two in that meddlesome spirit which afflicts so many people in the streets.

New Series of Timken Bearings.

One of the possible objections to the use of tapered roller bearings in the past has been the overall length of bearing space necessary to get in the required size of roller. This feature has now been eliminated in a new series of short bearings which is being marketed by the Timken Roller Bearing Axle Co., Canton, Ohio., which are exactly the same in principle and detail of construction as the former types, except in such features as affect the total length, which alone have been modified to suit the requirement. Consequently these new bearings are adapted to parts which heretofore could not be adapted to their use.

Besides containing all the improvements which are embodied in the other latest types of Timken bearing they are made from the best grade of steel, carbonized and heat treated, and finally ground to size with a tollerance of only 0.0005 inch, on the mid-point diameter. The fundamental characteristic of ribs on the cone, of course, is retained. The space required for the new bearing is only 1 1-32 inch in the smallest sizes, and but 1 9-16 inch in the largest. This decrease in length, coupled with the use of a relatively small diameter of cup, greatly enlarges the possible application of the bearing. As in the larger sizes, the rollers are retained by the new type of pressed steel, one-piece cage, which is advantageous in reducing the number of parts in the bearing, as well as in affording better opportunities in the way of lubrication.



Keeping Emergency Brake in Shape.

Particular care should be taken on cars which have seen considerable use, to make sure that the teeth on the ratchet of the emergency brake are not worn dangerously low. Where this is the case, there is great likelihood that the lever will "jump" when the motor is started, sometimes greatly endangering the machine. Whatever wear occurs is most apt to be on the outer teeth which are engaged when the lever is in the full "on" position, and as this is the most critical section of the segment it should be reshaped to its original profile just as soon as the ends of the teeth begin to show any signs of turning over or wearing down.

SUBSTITUTE FOR AUXILIARY TANK

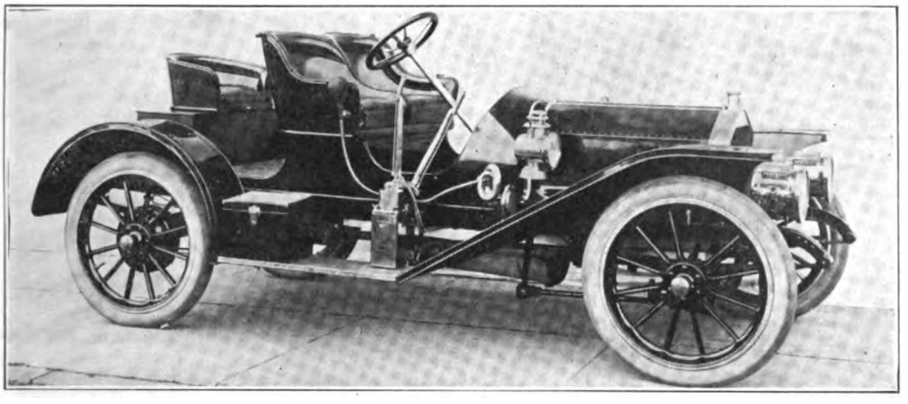
Utilizing Lower Portion of Fuel Receptacle for Extra Storage—An Ingenious Method of Piping Employed.

Force of circumstances, when the fuel supply has become suddenly and unexpectedly exhausted has caused many a motorist to bemoan his fate; and to prevent such periods of despair and the long tramps over lonely roads while the car is left in a ditch, which so often follow, a number of manufacturers have taken to fitting their cars with one or another of the several systems of compartment tanks which give ample warning when the supply begins to run

short. That these contrivances are more complicated and extensive than the circumstances really demand, is proved by the accompanying sketch of an ingenious method of piping, which is adaptable to any fuel tank, and which involves in addition to the introduction of one extra T-fitting in the pipe line and a short additional length of piping, one additional opening in the tank.

The suggestion, which is made by a foreign correspondent, is in a word, merely that of utilizing a very small part of the lower portion of the tank as an extra fuel storage space, drawing the main supply through an outlet which is raised by three or four inches above the bottom under ordinary circumstances. Thus, the reduction of the supply to a point where the main feed pipe no longer affords fuel to the motor is signalized at once and unmistakably, while the additional fuel remaining may be utilized by merely opening the secondary outlet and closing the main one. The system is applicable to gravity or pressure systems.

Descriptive Name for Raybestos.



"Raybestos,' the asbestos-copper wire fabric which is being used so extensively by motor car makers just at present in lining the working faces of brakes, is to have a new and explanatory sub-title. Hereafter, as the Royal Equipment Co., its makers announce, it will be known as "Raybestos Friction Facing."

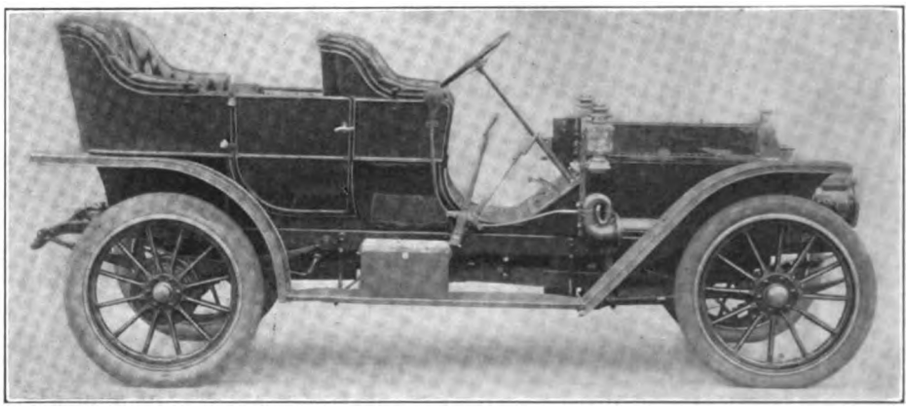
TWO NEW PULLMANS FOR 1909

Line for the Coming Season Offers Wide Range of Choice in Design and Power —Specifications of New Models.

With two new models and two others brought up to date from their 1908 standing, the York Motor Car Co., Inc., York, Pa., is well fortified for the business of 1909. The models include in the way of chassis and horsepower, the Model "L," 20 horsepower, runabout; Model "K," 30 horsepower five-passenger light touring car; Model "6-30," high speed runabout; the Model "4-40," gentleman's roadster, and the Model "M," which is a 40 horsepower, seven-passenger touring car. Of these, the newcomers are the Model "K," and the Model "M." With these distinct models as a basis, however, a range of option in body construction is offered which makes possible to the purchaser choice from a line of practically ten different models, included among which is a neat little taximeter cab, mounted on a 20 horsepower chassis and possessing a number of qualifications all its own.

YORK PULLMAN MODEL "L," 4 CYL. 20 H. P. ROADSTER



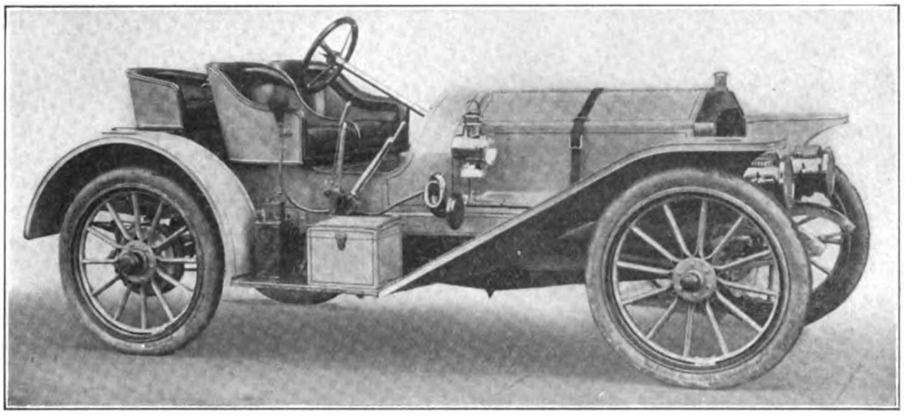
Model "K," is propelled by a vertical motor, four-cylinder, like all the Pullman motors with a single exception, and also in common with several of the other motors of its family of "squared" dimensions. The cylinders measure 4½ by 4½ inches. The cylinders are cast independently with heads and water jackets integral, and the valves, which are interchangeable, are located on opposite sides. Ignition is by jump spark with Bosch, high tension magneto, distributor, single coil and switch. Lubrication is by a system of integral distribution, newly developed, and so devised as to permit of regulation by valve adjustment to a positive oil level properly indicated. The speed range of the motor is from 150 to 1,800 revolutions per minute.

The master clutch is of the plain cone type, leather-faced and fitted with cork inserts. The change gear system is of the selective type affording three forward speeds. The gear shafts are mounted entirely on imported annular ball bearings, and the gearbox is of oil-tight construction, and designed to be packed with grease by way of providing for lubrication. The final drive is through a propeller shaft to the lixe axle which embodies a pressed steel housing, nickel steel shafts and gears, and the V-type of torsion rod. The front axle is of I-beam section, drop forged. Timken holler axle bearings are employed. The frame is of pressed steel with a substantial subframe carrying the entire power plant. The spring suspension is by semi-elliptic members at both ends of the chassis, the front ones being 40 inches long and those in the rear, 50. Both sets are 2 inches wide. The overall dimensions are: tires, 34 by 3½ inches; wheel base, 106 inches; tread, 56 inches; clearance, 10 inches, and weight somewhere in the neighborhood of 2,250 pounds.

In the second of the newcomers less difference from the current product of the company will be noticed. In fact, with a few comparatively slight changes, the car is much the same as already is produced. Of these alterations it may be noted that the wheel and tire sizes have been changed from the 1908 specifications to insure maximum comfort for general touring and now are 36 by 4 by 4½ inches. The frame and suspension construction is much the same in principle as is used on the Model "K," just described, except that the rear mounting of the chassis is reinforced by a semi-elliptic cross member shackled to the forward ends of the side springs. The gearset affords four forward speeds, instead of three, as in the former instance, and the direct drive connection is on the third instead of the fourth speed, the latter thus being "geared up" for sigh speed work under the occasionally excellent conditions found in ordinary touring. The drive and rear axle construction of this model is followed out in the same line as that of Model "K," including the floating system of mounting and the Timken bearings for the wheels.

The motor also is of regular Pullman design, having individually cast cylinders, of 5 by 5½ inches dimensions, and rated to develop 40 horsepower at 900 revolutions. As will be observed from the accompanying illustration of the chassis, the cylinder construction here perpetuates an original and rather peculiar system which has been employed on former models of these cars, in which the cylinders are cast with large core openings on the sides facing fore and aft of the chassis, the openings being flanged liberally and extended far enough so that the faces of adjoining cylinders may be bolted together—the effect thus secured being essentially that of the block casting, without the latter's drawback of high initial expense and high cost of replacement. The method secures for the cylinders a degree of rigidity which cannot be expected except in a battery of block cast cylinders, or those which are heavily braced together.

The Bosch ignition system is employed on this model, as is also the new oiling system. The clutch is leather faced, conical and fitted with cork inserts. The braking equipment is mounted entirely on the rear wheels, and is of the double, expanding-contracting type.



YORK PULLMAN 4 CYL. 30 H. P. MODEL "K"

To meet the demand for a high-powered runabout, the "4-40" model is continued over from the current line. In general its specifications are the same as for the Model "M," the chief difference between the two hinging about the construction of the body, and whatever minor alterations in the arrangement of the control mechanism may be involved.

The smallest car in the line, formerly known by its 20 horsepower rating, now is

Digitized by Google

dignified by the letter "L," but otherwise remains practically unchanged either in status or mechanical formation. The slight process of alteration it has undergone has involved the adoption of the new oiling system, and the placing of the water pump alongside the magneto, where it is driven from the same shaft which actuates the ignition device. This model has 32-inch wheels all around, three speed, selective change gear, annular ball bearings for the entire transmission, shaft drive, 102-inch wheel base, 10½ inches clearance, and

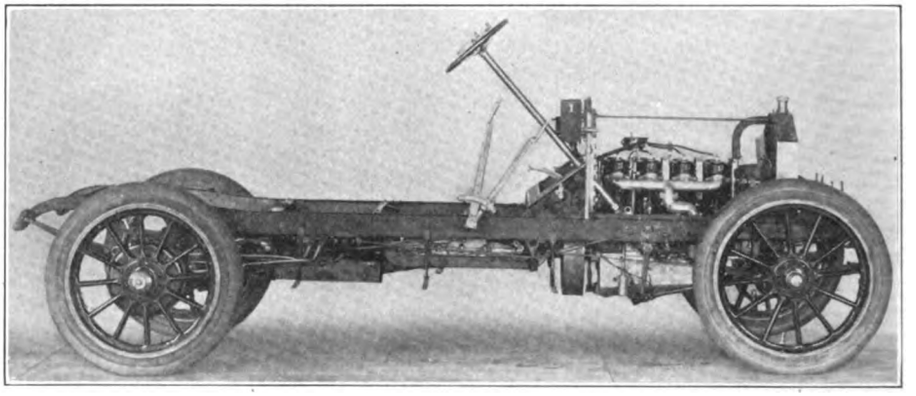
YORK PULLMAN 6 CYLINDER, 30 H. P. LIGHT SPEED CAR

weighs somewhere about 1,750 pounds. It is put out in both runabout and "toy tonneau" forms.

The final member of the regularly catalogued line is the Model "6-30" light roadster, which is continued over into 1909, but under the inducement of a reduced price. Its motor is rated at 30 horsepower when turning at 1,000 revolutions per minute, though its speed range is said to run from 200 to 2,000 revolutions. The cylinder dimensions are 3⅛ by 3⅛ inches, and it has the opposite, interchangeable valve arrangement.

The taxicab specifications call for the 3¼ by 3¼ inch engine, mounted in the usual pressed steel frame with sub-frame transmission and engine mounting, slung on 40 by 48 inch semi-elliptical springs, front and rear, both sets being 2 inches in width; running on 32-inch wheels, shod with 4-inch tires and having 102 inches wheel base and 56 inches tread. The clearance of the vehicle is 10 inches, and the weight complete something like 2,250 pounds. The chassis throughout has the improvements which are newly embodied in the other models of the line, including the new method of oiling the engine and the use of the Bosch magneto and coil. The brakes, however, are applied to the transmission shaft and the rear wheels, respectively, the latter being of the expanding type and actuated by the foot pedal for service use. The emergency lever applies the transmission brake.

The body design is of the landaulet order, with folding top but without the hood extension over the driver's seat. The latter extends the full width of the vehicle and may be used for the accommodation of an extra passenger. The rear seat is placed well back of the rear axle which, as the radiator is brought flush with the forward axle, and the driver's seat located with an eye to ample foot room, gives a luxurious air to the vehicle which is frequently lacking in machines designed for commercial passenger service alone. The interior accommodations provide for four passengers and are designed with due regard to bodily comfort quite as much as to complete the styles of the vehicle. The vehicle is finished in dark blue, with upholstery also in blue.



Advantages of the Thermo-Syphon.

"Even before the automobile became a factor in everyday life, when the intricacies of clutches and differentials were but indefinitely understood, engineers had largely solved the important problem of keeping the temperature of cylinders within working limits. Water cooling, that is by circulating water through specially designed chambers or "water jackets," has finally become the generally accepted type, but here designers disagree as to the best method of circulation," remarks J. D. Maxwell, of the Maxwell-Briscoe Motor Co.

"In 1901 and 1902, I made a series of experiments on both the pump and the gravity system, often referred to as the Thermo-Syphon system. As a result of these experiments, the thermo-syphon system has been a feature of Maxwell cars since 1904. Yet this system is not new; its earliest manifestation was the drawing up of water into the clouds by the sun.

"The advantages of the thermo-syphon system are several—the circulation is directly proportional to the heat developed and is independent of motor speed. In this respect, it differs materially from pump circulation, where the cooling effect is directly proportional to the speed of the engine. Secondly, unfailing reliability, since all mechanical devices such as the pump, gears and other connections, are eliminated. And lastly, the cooling effect is continued after the motor is stopped, until the cylinders and the jacketing water are of the same temperature.

"There seems to be a general impression that for equal horsepower, the thermo-syphon system is heavier than the pump system. In fact, this question was agitated last year in both the news and trade papers and at that time, the Maxwell-Briscoe Motor Co. submitted figures, showing that the amount of water carried in each case was pracically the same.

CHASSIS OF YORK PULLMAN 4 CYLINDER, 40 H. P. MODEL "M"

Internal Combustion Engineers Organize.

A new addition to the roster of engineering societies is the Internal Combustion Engineers Association, which has just been formed in Chicago, and which aspires to become a national, or even an international body. At present it has membership representation in the States of Ohio, Indiana, Illinois, Iowa, Wisconsin, Missouri and California. The association aims to advance in the broadest possible manner, the interests of internal combustion engineers, although it is neither a fraternal organization nor a union. In addition to assisting its members to obtain the most fitting positions and enable gas engine manufacturers to get more reliable and efficient service from their equipment, it will endeavor to develop greater uniformity of detail in design, material and workmanship among the various factories. The officers of the association are: President, H. R. Linn; vice-president, I. J. Bent; treasurer, I. J. Babcock, and secretary, Walter A. Sittig, all of Chicago.

FEATURES OF THE PARIS SALON

What It Revealed of the Trend in Foreign Design—New Things Seen in the Show of Accessories.

In the words of an American visitor, the Paris Salon which closed its doors on Sunday last, "was a pretty poor exhibition as a show of automobiles." Shorn of its former glory, it limped to a rather humble termination on Sunday last, after a period of strenuous effort to assume the important aspect of other Salons. It suffered first, from the fact that it had been subdivided, the commercial vehicle and flying machine exhibits which have graced it in former years, and which have served to expand it into the greatest exhibition of its kind known to the world, now being grouped by themselves in a separate exhibition to open next week. It suffered second from the ticklish state in which the European and particularly the French section of the industry now finds itself. Notwithstanding, a very brave face was put upon matters by all the car manufacturers and the usual atmosphere of gaiety pervaded the Grand Palais. In nearly every case the individual decorations on the stands were the same or nearly the same as were used last year. Happily for the general effect, some of them were so elaborate and costly as to be well worth seeing several times, and they served to bring up the effect of the ensemble.

In the matter of attendance, the early days revealed the usual crowd of sightseers, the Salon still maintaining its former prestige as a social function pre-eminent. Though the exterior of the show was subdued and reduced to the decoration of the single exhibition hall, though even the lottery which hitherto has been one of the big features of the show was suppressed and no more voiturettes "given away," the crowds continued to surge about the stands and present all the appearance of real business activity. An outlet for the press was furnished by the vacant spaces left by the several unoccupied stands which had been assigned to firms which later sunk under financial difficulties.

A general impression of the show, following the line of the forecasts published a couple of weeks ago revealed some little disappointment in the case of the cars exhibited, but an even more surprising improvement in the displays of accessories which, in variety, quantity and ingenuity outrivaled anything which has yet been seen. Small cars were in abundance, innovations scarce, and among even the more progressive manufacturers, significant changes a rarity. As for trend, it was observable that firms which continue to adhere to the policy of building large and expensive cars are inclining even more than formerly to the use of the sextuple motor, and that in many instances this principle is now carried down to cars of moderate power. Indeed a census of the show revealed a total of no less than 96 cars of this type as against 57 a year ago and only 23 in 1906. The light four-cylinder models, however, predominated. Of freak designs —once so prominent and diverting a feature of the Salon—there were practically none among the exhibits of cars. In the accessory section, however, this phase of the exhibition was renewed in the displays of motors designed for air-ship use, many of which are now produced by long-time automobile makers.

In the finer points of design about which such sharp controversies used to wage, there is now little diversity. Those makers who have settled upon systems which are more or less unusual, continue to adhere to them. Questions of the relative advantages of cone and multiple disc clutches, shaft and chain drives, thermo-syphon and pump systems of circulating the cooling water, high and low tension ignition, selective and progressive methods of actuating the change gear, and pressed steel and armored wood frames are no longer discussed to any great extent on the floor of the show. At the same time it is observable that certain of these questions have been settled by the makers themselves, not by the universal adoption of a single system, but by the use of different ones on different models.

Thus, with the idea that low tension ignition gives better service in the hands of skilled drivers than when placed under the control of the private owner or the novice, several of the makers, among them the producers of the Brasier, Berliet, Mercedes and Lorraine-De Dietrich cars, are now fitting that system on their larger powered machines, while for the medium and low powered models they use the high tension system with its advantage of greater simplicity.

Simplification of dashboards, so noticeable in this country a year ago has now taken hold in France to a more evident degree. The newer Panhard cars, for instance, instead of the coil lubricator and other accessories which formerly adorned them, now have clean dashboards with only the switch and sight-feed glass of the lubricator in sight. The coil has been placed under the bonnet and the lubricator also is located on the front side of the dash. In the case of the Berliet cars, the abandonment of the pressure system of feeding the fuel has permitted the elimination of the several adjuncts to that arrangement, while even the two sight-feed glasses on the rear axle and transmission lubricator lines, have been relegated to a place of concealment under the bonnet. The Renault cars now have the sight feeds of the lubricator let into a special and very neat form of panel on the dash, and are enclosed under a glass plate which is flush with the face of the dash. The lubricator is lodged in front of the dash, and the filling cap is placed directly beind that of the radiator, which continues to occupy its former position straddling the front of the dash. Oddly enough, on this stand is to be seen the only survivor of the numerous self-starting devices which cropped up so plentifully a year ago.

Several makers other than Renault are coming to like the placing of the radiator on the dash, the Berliet cars now having a top and bottom tank so mounted, while several smaller firms have copied the same idea. On the new C. G. V. cars the gilled tube radiator is not carried clear across the dash, but is cut away to admit the placing of the fan directly within its enclosure.

Among improvements in engine construction several instances in which the valves had been suitably encased were noted, as with the Bollée, and Delahaye, the latter also adding a casing for the gas intake and exhaust and the water inlet connections. In general, however, changes in this quarter were scarce and not remarkably significant. Practically the only strikingly novel exhibit was that of the Europeanized, American Silent Knight engine, which was shown on two different stands by concessionaries of the Daimler company, one of them exhibiting a gasolene-electric chassis which mounted it. The Panhard firm, which also had been expected to display this motor as a feature, failed to produce it on any of its models.

A brief scanning of the exhibits with regard to transmission construction, revealed a noticeable disappearance except in rare instances of the expanding ring clutch, which is regarded as having numerous shortcomings; and a continuance of the struggle between the cone and disc types, with many changes of dimensions in the latter to indicate that practice in its design is even yet very unsettled. Change gears are no longer remarkable as an attraction to the seeker after novelty, and but one of the many "mixed" systems which have been shown in former years, is now in a flourishing condition. Live axle constructions continue to multiply on cars of all types except those of the highest power.

The international character of the show has dwindled in keeping with its shrinkage in other respects. While the usual number of other European makers were in evidence, England contributed but a single exhibit, while America had but two. Of these, that of the Ford Motor Co. figured most noticeably.

Inventors Invited to a Competition.

In an effort to secure an effective appliance for preventing any splashing from their vehicles upon their patrons and other pedestrians, the Companie Générale des Omnibus, of Paris, is organizing a competition for contrivances of this nature. Among the specifications on the entry blanks are that competitors shall state the price at which the devices may be had, and also the amount of royalty which would be demanded in the event of the company's deciding to manufacture them on their own account.

YOUNG HOODLUMS AROUSE PROTEST

Buffalo Police Department Requested to Stop Boyish Attacks on Motorists—Their Outlawry a Menace.

Because a solicitous mother pointed a gun at a representative of the firm when he undertook to remonstrate because her offspring had snowballed him while driving a car, the E. R. Thomas Motor Co. has filed a protest with the Buffalo (N. Y.) police department, pointing to the rapid growth among the youth of the surrounding territory of amusing itself by throwing things at passing motorists. This is the second time the Thomas company has resorted to this measure, a former attempt to secure protection from the police having proved of no avail.

"Some time ago," says the letter, "an out-of-town customer was riding in one of our cars when a boy threw a hard snowball which hit our customer in the eye, breaking his glasses and a part of the lens entered the eyeball and nearly caused the loss of sight.

"A few days ago the writer was struck in the eye by a snowball thrown by a boy. The pain was very intense and for a time there was serious danger of losing the sight of the eye.

"The writer succeeded in catching the boy as he was entering his home and intended to explain to the mother what the boy had done so that she might make an effort to stop his habit, but instead of making any effort to chastise the boy she rushed to the window with a revolver and threatened to shoot the writer, which she probably would have done if the boy himself had not had presence of mind enough to stop her threatened action by explaining the deed.

"It seems impossible to get the parents to make any effort to stop the practice so that we have nothing left but to appeal to your department. We trust you will appreciate the extreme seriousness of this rapidly growing habit and the extent to which it exists to-day, and sincerely hope that you will find some means of stopping it."

Chicago May Offer More Trophies.

At the annual meeting of the Chicago Motor Club on Tuesday, 8th inst., besides re-electing F. C. Donald president, the idea of adding two more trophies for the annual A. A. A. tour was agitated. The club is anxious to hold, under its own rules, in connection with the tour, a gasolene consumption contest and a non-repair competition. Some weeks ago, Col Studebaker offered a $5,000 cup for a no-repair test in this tour and if he sees fit to award this trophy under the Chicago club's formulated rules, that will prove highly satisfactory; otherwise, the club wants to put up its own trophy.

As one of the C. M. C.'s aims is to promote economy among drivers, it is willing to put up a cup to be contested for under its own gasolene consumption formula by Glidden tour entrants, and believes that such a contest would please manufacturers.

In the election, in which there were three tickets, Donald's rival candidate, Thomas Hay, backed out at the last moment and gave the winner a clean sweep, the third ticket also including Donald's name. The slate for the coming year is as follows: President, F. C. Donald; first vice-president, Charles P. Root; second vice-president, David Beecroft; secretary-treasurer, F. H. Trego; directors, F. E. Edwards, Paul Picard, Louis Geyler, J. V. Lawrence, H. P. Branstetter.

Women to Hold Reliability Test.

On December 20 and 30, if all goes as is proposed, there will be a road contest from New York to Philadelphia and return that will have at least one novel feature. It will be the first run of the Women's Motoring Club of New York and women drivers only will be eligible as contestants. Entry blanks have been issued by W. J. Morgan, who is to manage the affair and who believes that he can make the run a success. The cars will start at 9 a. m., Tuesday, December 29, from Columbus Circle and make a stop along the route in New Jersey, for luncheon. Upon arriving at the Quaker City the local women's motoring organization that bears that pretty name, La Manigata Klaubo, will receive the contestants at the Walton.

While the rules require that women must drive the entire distance, male mechanics will be permitted, to attend to the heavy work of cranking and changing tires. While no official observers will be appointed in the usual manner, all passengers of each contesting car will be required to sign each day's card and jointly report repairs and adjustments, thereby being placed upon their honor. All types of automobiles will be eligible.

Harrisburg Announces Four Days Contest.

Having conducted a few very successful reliability contests in the past, the Motor Club of Harrisburg, Pa., announces a four days reliability run for the first week in May, 1909. As it is generally understood that next year's Glidden tour will start from Chicago and proceed westward, the Harrisburg Club will aim to make its contest the chief eastern reliability tour of 1909. The Harrisburg body is now planning to ask the co-operation of several of the larger eastern clubs, which will be requested to appoint a number of the officials of the contest. The rules will provide for a schedule well up to the legal limit, with observers on all cars; also a technical examination at the finish. One of the proposed features will be an actual tire record giving a practical contest for tire manufacturers.

RIDICULE KILLS A BRIGHT IDEA

Card System for Identification of Motorists Looks Good to St. Louis Police Chief—But the Public Kicks.

Some time ago a bright idea originated in the heads of certain members of the Automobile Club of St. Louis for a novel card system that was calculated to do away with much of the annoyance occasioned when members were arrested for speeding. The arrangement was for drivers to carry cards issued by the local club and countersigned by the chief of police. If placed under arrest by a policeman, all that would be necessary for them to do, would be to display the passport, giving the cop the number and then the motorist might proceed upon his way in perfect peace. He would merely have to appear in court the next day to answer the charge.

Chief of Police Creecy considered this plan a good one at first, but he changed his mind later when citizens of St. Louis who were not members of the club set up a howl and as a result, the card system will not materialize. As soon as the idea was made known, the newspapers and comic supplement editors took it up and made it the butt of numerous jokes, some suggesting that the chief extend the system to benefit those who could not afford the luxuries of automobiles, such as recognized professionals among the porch-climbers, highwaymen, confidence men and lady shop-lifters, to save them the annoyance and embarrassment of being arrested at inconvenient moments.

In reply to the objections of those who were not members of the automobile club, the Chief declared that he intended no discrimination regarding non-members, but that the idea would have held good for any motor car owners who cared to make application to him for cards. Inasmuch as the people seemed to have the idea that the club was being favored, however, he decided not to inaugurate the plan.

Thespians Abandon Trains for Automobiles.

While it is the usual custom for theatrical companies to use the railroads as a means of transportation from place to place, or more often to walk, up-to-date methods are now being employed by a number of Broadway favorites. Walter Hale, who owns a 40 horsepower Studebaker car is so disgusted with the disagreeable features of train travel that he has practically abandoned that style of transportation and with a few of the leading members of "The Wolf" company, uses his car almost exclusively. The railroad is graciously permitted to carry the trunks, scenery and the minor members of the cast, but Hale no longer has to worry about time table schedules.

JAIL SENTENCE FOR JOY RIDER

Court Regrets that He Cannot Make the Term a Year—Maximum Fine Added to Thirty Days' Imprisonment.

"It's almost a pity you weren't killed. Thirty days and $250 fine is the heaviest sentence we can give you, I regret to say. I wish I could give you a year," declared Justice Wyatt in the Court of Special Sessions, New York City, one day last week, when Felix Droit, a French chauffeur, was being tried for speeding. This penalty is the heaviest ever imposed upon a driver in that court for breaking the speed laws, and if Droit is unable to pay the fine, he will be confined in jail 250 days in lieu thereof.

According to the testimony of Policeman Rickert of the motorcycle squad, Droit was speeding up Broadway at a rate of 40 miles an hour on the morning of August 28 last, at about 5 o'clock. At Fifty-second street, Rickert gave chase and Droit swung into Fifty-first street and up Seventh avenue and then amused himself by zig-zagging in and out of various streets on the West side between Thirty-fourth and Fifty-seventh streets, with the motorcycle cop in pursuit. It was not until the driver hit an "L" pillar at Fifty-first street and Third avenue that the chase ended. Rickert declared that Droit turned corners in the most dangerous fashion and added: "Half the time he was on the sidewalk. He ran two blocks on the sidewalk on Thirty-fourth street. I fired five shots at his tire during the chase, but I couldn't hit it. It was the most daredevil driving I ever saw. Even when he hit the pillar and his left rear wheel came off it didn't stop him. He stuck to the machine and it slid a whole block, it was going at such speed."

After hearing other witnesses, who testified that on the date of the chase, the owner of the car, H. P. Wilson, was in California and that the chauffeur was "joy-riding," the court decided to make an example of him and held that the fact the speeding was done at an hour when there was little traffic in the streets, did not alter the case any.

Following the decision, District Attorney Jerome said he would endeavor to have Droit's chauffeur's license revoked and if he finds that the law as it now stands, does not provide for such revocation, he will try to have a bill passed in the Legislature that will enable the District Atorney's office to revoke licenses after a third offense.

New York Leads in Road Building.

According to the statement issued on December 12, by State Engineer Frederick Skene, of New York, 820 miles of good roads have been constructed in New York State during the current year. This is considably more than was accomplished in 1907, when only 311 miles were built. Skene also points with pride to the fact that while Massachusetts and New Jersey formerly were leaders in good roads work, New York State is now far in advance of these in highway improvement.

"There are at present approximately 500 miles under contract," he states, "and over 1,000 miles awaiting contract. Of the $50,000,000 State money voted by the people for this work, $11,000,000 has been appropriated.

"If the roads completed during the last season were placed end to end they would reach from New York City to Buffalo, via Albany and Rochester, and from Buffalo to New York City, via Elmira and Binghamton."

Owners Who Drive Must be Licensed.

Because many New Jersey automobile owners who employ chauffeurs to drive their cars, are careless about obtaining licenses for themselves to cover the infrequent occasions when they care to drive their own machines, the State commissioner of motor vehicles has issued a warning to this class of motorists. The department expects to keep close watch on owners who are careless about the matter of their own driving licenses. In a word, a man owning a high-powered car, which ordinarily is driven by a chauffeur, has got to pay $28 or more annually instead of $14, if he himself cares to take the wheel occasionally.

Virginia Motorists Want to be Taxed.

Virginia motorists are making an effort to get the State to tax each automobile owner within its borders the sum of $10, instead of not taxing them at all, as is now the case. The motorists want to be taxed so that good roads can be built, over which they may drive in comfort. It is estimated that there are now about 500 cars owned in the State and that a taxation at the rate proposed would raise an annual fund of $5,000, which is used to augment the State's small appropriation for good roads, would be of considerable benefit. Several of the automobile associations in Virginia hope to introduce a bill in the legislature.

Maxwell-Briscoe Owners Getting Together.

Clubs composed exclusively of the owners of certain makes of car are finding a useful purpose in amalgamating the common interests of the members, who are bound together by ties altogether different from those which exist in the more ordinary form of motoring organization. The latest association of this type to be conceived, is the Mexwell-Briscoe Motor Club, which is now in process of formation. An annual tour of two or three weeks' duration is to be one of its allurements to prospective members.

Three Cities Ready for Taximeter Cabs.

Denver, St. Louis and New Orleans are all promised taximeter cabs in the near future. In each case the tentative date for the installation is about the first of the year.

LAW SAID TO INJURE BUSINESS

New Jersey Automobile Trade Association Alleges a Boycott of the State—Demand for More Liberal Legislation.

Claiming to feel the resentment of motor car owners and manufacturers at New Jersey's automobile law, in a decline of business and a withdrawal of orders by individuals and companies outside of the State, the New Jersey Automobile Trade Association appointed a committee, on the 10th inst., to take steps for a modification or repeal of the law. The resolutions accompanying the appointment of the committee recited that many automobilists are avoiding New Jersey altogether, thus lessening the revenue of the residents, and that the fifty or more lines of trade within the State which are more or less directly concerned in the automobile industry are "seriously menaced owing to the arbitrary laws enacted and now in force" relating to the motor car traffic.

At the meeting a number of letters were read, wherein the New Jersey recipients were told that they need not expect further business from the writers until the State's attitude toward automobiles was changed for the better. Instances were given where visiting motorists were fined for coming within the State without a license, yet who, because of holiday regulations, were not able to obtain licenses to proceed after paying their fines. Altogether the law came in for a severe scoring, and the trade interests of the State purpose to see that it is remedied.

Long Island Club Elects Officers.

At the Long Island Automobile Club's election, held on Wednesday, 2d inst., at the club house, Frank G. Webb was chosen president, William Schlimpf proving victorious for vice-president, and C. C. Cluff for treasurer, while Herbert Andrews is to be the new secretary. When the election started two tickets were in the field. Three new members were chosen to act on the board of governors: Alfred Weimarth, Charles Jerome Edwards, and Dr. A. C. Howe. Announcement was made of the annual club dinner to be held Thursday evening, December 10. The secretary's report showed a gain of 50 members during the past year.

Chicago Club Auxiliary Issues Bonds.

A 6 per cent. bond issue to the amount of $25,000, has been underwritten by the Western Trust and Savings Bank for the Chicago Automobile Club Auxiliary Association. The bonds are due August 1, 1913, and the property consists of the leasehold and improvements of the southeast corner of Jackson Boulevard and Plymouth Place, together with other real estate.

WHEN THE TARIFF WALL HELPED

How Importers Clambered Over It to Paths of Opulence—Typical Transactions Before Tribulation Began.

Efforts on the part of the importers of foreign made cars to gain the advantages of a tariff reduction serve to call attention to the comparative straits in which they now find themselves by contrast with the former palmy days when they were in no way surrounded with any of their present difficulties either in securing a market for the product they represented, or in exploiting it at almost any price they cared to name. Indeed, the days are not long past when the "tariff wall," now become so onerous, was welcomed as an excuse for raising the price of the European product, and was accepted by the opulent purchaser almost as a matter of course, and without protest. In reminiscent mood, a man who has long been familiar with the operations which have characterized the foreign market in New York City, recently gave an instance or two as typical of some of the methods which were so profitably carried on a few years ago, when the most palatial and exclusive establishments along upper Broadway were those conducted by the importers.

"It was not enough to add item after item to the cost in those days," he said, "until the sum which the buyer paid for a car of pretentious appearance soared way up into the thousands beyond its legitimate value, but occasionally the dealer resorted to the most brazen trickery in his zeal for swapping the foreign made automobile for the American-made dollar. Here is a case in point which came to my knowledge a while ago, and which concerned an importing company then well known, if not notorious for the lavish display of its establishment and the huge prices asked and received for the famous car which it handled.

"One of the 'gilded youths' of the town took it into his head to buy one of those particular cars, and was accordingly mulcted to the tune of $16,000 or thereabouts for the car and its complete equipment. A few days later, becoming hard pressed for money, he was forced to dispose of his new possession, and approached the manager of the same concern with a proposition to stand the car on the floor in the hope that the company could secure a buyer for it. The offer was accepted with the usual assurances that only the most nominal figures were allowed for "second-hand" cars, and that the company would require a liberal commission in return for its efforts at disposing of the undesirable property when it had plenty of newer and therefore better cars of its own to offer the purchaser. Needless to say, the terms were readily agreed to and the car was polished up and put in the show room.

"Not many days afterward there appeared at the office a wealthy creamery operator from Pennsylvania who wanted a fast car to take him daily between his office in Philadelphia and his country home. He wanted a 90 horsepower car, he said—one that would go '60 miles an hour.' He was advised by the suave manager that they had no 90 horsepower cars just then, but they had a 60 horsepower car which ought to just about satisfy his requirement. Accordingly, the storage car was taken out, and he was given a speedy demonstration over the road to the City of Brotherly Love at a rate which fairly took his breath away, and actually made him beg the driver to save his life by slowing down. The car having thus proved satisfactory, a sale was agreed upon, and this second purchaser was taxed the full $16,000 for the car and its original equipment before he became possessor of it.

"The young New Yorker who had owned the car for a brief space of time, but not long enough to mar its finish, was then approached with the glad tidings that the assiduous management had at length succeeded in disposing of his machine, and at a very gratifying figure, too. By great good fortune the car had been sold for no less than $9,500, which, deducting the firm's commission of $1,000 for the transaction, would net the happy near-bankrupt exactly $8,500. He was even congratulated on his 'luck' in getting so much for the car, and I daresay the congratulations were sincere, for I don't know why they gave him as much as they did.

"But there were two sides to the importers' story then, as there are now," he continued. "In one instance, this same company gave a long series of most promising demonstrations to a young man of apparently wealthy circumstances, who for a period of not days, but weeks, ordered the demonstrator to meet him at the Waldorf Hotel late in the afternoon each day, and thereupon went for long rides with his charming lady friends, and had very gay times indeed. He was pleased with the car, he announced at length, but still questioned it in one or two respects. Finally, some question having been raised as to whether he actually lived at the Waldorf, a salesman hopped on the car one night, and pointedly offered to 'take him home.' This failing to bring about the desired result, a quiet investigation was commenced, when it was learned with some alarm that the supposedly good 'prospect' actually resided in a very limited uptown flat under the tender solicitude of his mother, that he had hardly enough money to pay for his elaborate motoring apparel, and that he was in the habit of meeting his Waldorf appointments by riding downtown on a trolley car.

"You will see from this that the importers were forced to exercise self-protective and retaliatory measures sometimes. Though you can judge for yourself whether they managed to keep themselves afloat," he concluded.

LIGHT ON ENGLAND'S PATENT LAW

How Far It Binds Foreign Inventors to British Manufacture—Assemblage of Machines Apparently Sufficient.

Doubt and anxiety as to the interpretations under which the new patent act in the United Kingdom will be administered, has led numerous American manufacturers to address inquiries to the American consuls stationed in Great Britain, particularly as to the extent to which the provision for manufacture in the United Kingdom is binding. In this connection Consul J. N. McCunn, at Glasgow, replies to a New York inquirer as follows:

"With regard to the clause 'to an adequate extent,' I am informed that it would appear to be perfectly in order, in the meantime, to manufacture the parts of a machine in the United States and have them assembled in the United Kingdom. The ground on which this view is taken is that each part of the machine, taken separately, is not a patented article, the patent merely applying to the machine as a whole. No test case has yet been taken in the British courts, and I am informed that the above is the generally accepted reading of the law until such a test case is brought.

"A company has recently been started in Glasgow," he concludes, "having for its object the safeguarding of the property of foreign patentees selling in the British Isles, and one of their pamphlets, which gives excerpts from the patent act, is forwarded and may be obtained from the Bureau of Manufactures."

Growth of the Industry in Germany.

It is difficult to appreciate the rate of growth of the automobile industry, so rapid has been its expansion during the past few years, and so absorbing have been the details of technical improvement which have attracted attention almost to the exclusion of all consideration of its business development. Its rate of increase the world over, however, is aptly reflected in the case of Germany where the dozen automobile factories of 1901 had been increased to 24 in 1906, while the value of the total product had increased nearly ten-fold in the five years. The German official statistics are quoted by American Consul William Thomas Ree, of Bremen:

"In 1901 there existed in Germany 12 automobile factories employing 1,589 persons, while in 1906 this number had increased to 34 factories with 10,347 employes. In 1901 $431,873 in wages were paid by the factories, or $272 per workman, while in 1906 $3,171,012 were paid for wages, or $307 per workman. The total value of production shows nearly a tenfold increase in the five years. It amounted in 1901 to about $1,340,000, and in 1906 to $12,200,000."

Digitized by Google

The Week's Patents.

898,317. Explosive Engine. Varnum F. Carpenter, Cleveland, Ohio. Filed Dec. 21, 1907. Serial No. 407,527.

1. An engine having an explosion chamber and a piston therein, a duct for the charge leading to said chamber, a rotatable valve in said duct, means to rotate said valve and open and close the same at alternate strokes of the piston and means to retire said valve from said duct and leave the duct unobstructed, whereby a two-cycle engine is obtained.

898,361. Carburetter. Frank H. Heitger, Indianapolis, Ind., assignor to Speed Changing Pulley Company, Indianapolis, Ind., a Corporation of Indiana. Filed March 31, 1906. Serial No. 309,195.

1. In a device of the class described, a mixing chamber having an air inlet opening at the bottom and an outlet at the top, in combination with a liquid reservoir adjacent to said chamber and having a duct extending beneath the opening in the latter, a nozzle rising into said chamber from said duct, an air valve concentric with said nozzle for regulating the admission of air at the inlet opening, and a vapor tube within said chamber and forming a guide for said valve, substantially as described.

898,402. Elastic Vehicle Tire. William Brameld, Paterson, N. J., assignor of one-tenth to James T. Jordan, Paterson, N. J. Filed Aug. 14, 1907. Serial No. 388,449.

1. An elastic unitary tire member having cells arranged in lines radiating, in the cross section of the member, from substantially a common center, each cell extending short of the exterior surface of said member but having its radial dimension equal to the major portion of the corresponding dimension of said member, substantially as described.

898,427. Igniter for Explosion Engines. Henri Benoist, Paris, France. Filed Sept. 24, 1907. Serial No. 394,334.

1. In a device of the character described, the combination with a main supporting member, of an insulated stem extending therethrough, an auxiliary supporting member designed to be telescopically, removably secured to the main supporting member and terminating in an electrode, an insulating member contained within said auxiliary supporting member and a pin passing through said insulating member and terminating in an electrode, said pin being designed to contact with said stem to conduct current to the said electrodes.

898,436. Vehicle Wheel. Herbert Clifford, New London, Conn., assignor to Ralph Clifford, Monson, Mass. Filed April 20, 1907. Serial No. 369,353.

1. A vehicle wheel comprising a hub, spokes and felly, and a rim formed from convolute springs and ends of which are bent inward beyond said felly to which the ends of the springs are secured, substantially as described.

898,438. Engine Starter. Clyde J. Coleman, Rockaway, N. J., assignor to Conrad Hubert, New York, N. Y. Filed Aug. 13, 1904. Serial No. 220,648.

An engine starter comprising power applying means engageable with the engine, a pressure applying chamber, the power applying means being actuatable by pressure in the chamber to move it in one direction to start the engine, means opposed to such movement and operative to return the power applying means to starting position when the pressure in the chamber is relieved, pressure storage means, and a pressure and exhaust valve controlling the communication from the storage means to the chamber, and also controlling an exhaust from the chamber.

898,483. Spout for Cans. Charles F. Kellom, Philadelphia, Pa. Filed March 16, 1907. Serial No. 362,661. Renewed June 20, 1908. Serial No. 439,599.

1. In a can, a nozzle and a spout pivotally and invertibly supported adjacent said nozzle and adapted to be brought concentric with relation to and to coact with said nozzle, said spout having means embracing said nozzle whereby the contents of the can may be poured therefrom without leaking or spilling.

898,494. Carburetter. Louis P. Mooers, Cleveland, Ohio. Filed June 30, 1905. Serial No. 267,679.

1. In an explosive engine a plurality of independent sets of carburetting means, one of the carburetting factors being the same in each set, other carburetting factors being different in each set, a mixing chamber, an engine throttle and means operating simultaneously with the closing movement of the throttle to cut off that carburetting set having the least carburetting effect for a given volumetric rate of flow of the mixture therefrom.

898,495. Carburetter. Louis P. Mooers, Cleveland, Ohio. Filed June 30, 1905. Serial No. 267,680.

1. In an explosion engine, a plurality of independent sets of carburetting means having different permanent carburetting factors, an engine throttle, and means operating simultaneously with the throttle for throwing any individual one of said carburetting sets out of operation, and bringing a second set having a different permanent factor into action.

898,497. Automobile Tire. William Muller, Philadelphia, Pa. Filed Sept. 27, 1907. Serial No. 394,782.

In an automobile wheel, a split rim formed with opposing and inwardly curved jaws, one jaw being integral with the wheel spoke and the other jaw being removably secured to said wheel spoke, a spring chamber recessed in said split rim and formed partly in the integral and partly in the removable jaw thereof, a tire having an enlarged tread and base and a narrowed neck, a tire sheath secured to and inclosing the neck and base of said tire, a plunger secured to said tire sheath and slidably mounted in said spring chamber, a spring coiled in said spring chamber, and a tension bolt mounted in the end of said spring chamber, whereby the tension of said spring may be regulated, substantially as described.

898,567. Gasolene Filter. John Ellis, Lynn, Mass. Filed April 28, 1906. Serial No. 314,141.

1. A gasolene filter and separator comprising in its construction a casing provided with a passageway extending longitudinally therethrough and having an inlet and an outlet orifice, said casing provided with a filter chamber adjacent to said inlet orifice, there being a precipitation chamber located beneath said passageway between said filter and said orifice.

898,608. Vehicle Wheel. Christian Seewald, Williamsport, Pa. Filed April 22, 1907. Serial No. 369,540.

1. A vehicle wheel having a hub, spring spokes with their inner ends secured to said hub, a rim to which the outer ends of said spokes are fastened, discs at the end of the hub bearing respectively against the opposite sides of the spokes near their outer ends for transmitting driving stress to said spokes near their outer ends.

898,665. Lens. Geo. A. Macbeth, Pittsburg, Pa., assignor to C. T. Ham Manufacturing Company, Rochester, N. Y., a Corporation of New York. Filed May 21, 1908. Serial No. 434,076.

1. A lens comprising a concave convex ringed refracting portion and an integral surrounding plain annulus of greatest thickness at its inner edge and tapering therefrom to the outer edge.

898,678. Casing and Cylinder Construction for Gas Engines and the Like. Charles R. Piggins, Racine, Wis., assignor of one-half to Frederick Piggins, Racine, Wis. Filed Feb. 26, 1908. Serial No. 417,837.

1. A gas engine casing, comprising a base having a cylinder seat, a water conduit and a gas conduit within the base each having an opening leading to the top of the base, an engine cylinder mounted on the cylinder seat of the base and provided with a water passage and a gas passage within its walls adapted to register with the openings of the water conduit and the gas conduit respectively, a water jacket communicating with the water passage, and an intake valve chamber communicating with the gas passage.

898,714. Anchoring and Tension Device for Tire Protectors. Samuel C. Wolfe, Angola, Ind. Filed Nov. 14, 1907. Serial No. 402,121.

1. In a tire protector of the class described, the combination of a tire receiving sleeve having free edge portions, means for securing said sleeve to a wheel and comprising rigid split rings detachably applied to the free edge portions of the sleeve, means for adjusting the connection between the ends of the split rings, and tension devices connected with the split rings, each consisting of a housing, windlass shafts mounted in said housing, flexible members connected with the windlass shafts and with the split rings, and means whereby the flexible members may be wound on the shafts for the purpose specified.

898,798. Shock Absorber for Automobiles. Irving Stanley, New York, N. Y., assignor to Merritt S. Middleton, Brooklyn, N. Y. Filed Aug. 8, 1907. Serial No. 387,584.

In a shock absorber, an integral casting comprising a hollow casing and an attaching plate having bolt holes, whereby the structure may be rigidly attached to the car, a cylinder closed at one end and threaded into the casing, a piston in the cylinder provided with an unobstructed passageway of permanent and uniform capacity, whereby the material in the cylinder may pass from one side to the other of the piston, a rock shaft journaled in the casing, two cranks on the rock shaft, one within and the other without the casing, means connecting the crank within the casing with the piston and other means connecting the other crank with an appropriate part of the car.

898,807. Valve Mechanism for Engines. William L. Wayrynen, Dolph, S. D. Filed June 25, 1907. Serial No. 380,762.

1. In an engine, a cylinder having an inlet valve, a valve stem carried thereby and extending to the exterior of the cylinder, a casing inclosing the outer end of said valve stem and having an opening in the side

Digitized by Google

thereof, a lever pivoted to said casing and having a portion thereof adapted to enter said opening to engage with said valve stem, an exhaust valve, a valve stem therefor, and engaging with said lever to intermittently move it into and out of engagement with said inlet valve stem, and means adapted to engage with said lever to cause the latter to lock the inlet valve in its closed position when the engine exceeds a predetermined speed.

898,832. Elastic Tire for Wheels. Felix J. Chary, Paris, France. Filed Jan. 13, 1906. Serial No. 295,920.

In a tire for vehicle wheels, the combination, with the rim, of a plurality of frames of parallelogrammic form secured in said rim independently of each other, each frame having a groove at its under part on all sides, and inwardly projecting tongues intermediately of the length of all of the sides, and tread blocks secured within said frames by means of base flanges which extend beneath said tongues and into said grooves, the grooves or spaces between adjacent blocks extending obliquely of the tread surface.

898,850. Pneumatic Tire. William Drury, Swansea, Wales, England. Filed April 14, 1905. Serial No. 255,520½.

1. In a pneumatic tire, the combination of an inner strain cover divided longitudinally upon its outer part, an outer tread cover divided longitudinally upon its inner part, interlocking means intermediate between said covers, such means acting to interlock the parts under inflation, said interlocking means comprising longitudinally extending recesses and interlocking projections.

898,903. Rotary Gasolene Engine. Chas. W. Lindsay, Anthon, Iowa. Filed Aug. 23, 1905. Serial No. 275,448.

1. In an engine, the combination of a pair of sections each comprising a cylinder and half a crank chamber, bolts for connecting the sections together, bearings formed on the sections and lying in the plane of division thereof, a crank shaft mounted in the bearings and having a bore extending short of the inner end thereof and provided with a plurality of transverse passages leading out of the bore, sleeves in one of the shaft bearings leading out of the bore, sleeves in one of the shaft bearings and arranged in spaced relation to form a chamber into which the said passages discharge, pistons in the cylinders, connections between the pistons and crank shaft, a valve chamber on each cylinder, an inlet valve in each chamber, an exhaust valve in each chamber, stems on the exhaust valves extending parallel with the cylinders and disposed on opposite sides of the crank shaft, bearings on the cylinders for the valve stems, secondary shafts disposed parallel with the crank shaft, bearings on the cylinders for the inner ends of the secondary shafts, oppositely disposed bearings on one of the crank shaft bearings for the secondary shafts, a pinion on the crank shaft, and gear wheels on the secondary shafts meshing with the pinion.

898,907. Tire for Vehicle Wheels. Tod J. Mell, Youngstown, Ohio, assignor to The Republic Rubber Company, Youngstown, Ohio, a Corporation of Ohio. Filed May 25, 1908. Serial No. 434,915.

1. A tire for vehicle wheels provided with outwardly projecting circumferentially arranged elongated studs each having inwardly diverging walls, a flat outer surface, and a relatively large base, substantially as described.

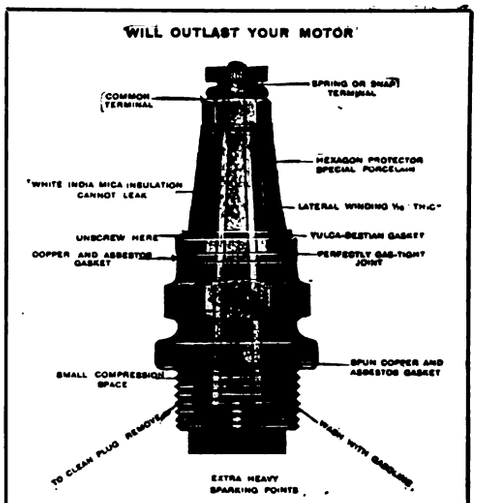
898,920. Carburetter. George S. Pierson, Kalamazoo, Mich. Filed Oct. 7, 1907. Serial No. 396,228.

1. In a carburetter; the combination of a fuel reservoir; means for maintaining the fuel in said reservoir substantially at a constant level; a main air passage; a chamber or well opening upwardly into said air passage and depending into said reservoir; a fuel opening in the bottom of said well communicating with said reservoir; an air tube hanging in said well, said tube supplying air to the bottom of said well independently of said main air passage, said tube being adjustable to vary the space between its lower end and the bottom of said well for the purpose of regulating the discharge of mixed air and fuel through said space and upwardly through said well.

899,055. Speedometer. Joseph W. Jones, New York, N. Y. Filed Nov. 5, 1907. Serial No. 400,787.

1. In a speedometer, the combination with a shaft adapted to be driven by the mechanism or vehicle the speed of which is to be measured, of a device movable longitudinally on said shaft, means for imparting movement to said device proportionately to the speed of the shaft, means operated by said longitudinally movable device for indicating the extent of its longitudinal movement and thereby the speed at which said mechanism or vehicle is being operated, and means intermediate the said longitudinally movable device and the said indicating means adapted to adjustably operatively connect the same together; said indicating means comprising a shaft bearing an index or pointer; and said intermediate means comprising a slotted disc fast on said index shaft, a pin operatively connected with said disc in the slot thereof and also operatively connected with the said longitudinally movable device on the driven shaft, and means adapted to move said pin in said slot toward or away from the index shaft.

899,056. Non-Skidding Device for Wheels of Vehicles. Henry H. Kenshole, Ilford, England. Filed Jan. 8, 1907. Serial No. 351,384.



1. A non-skidding device for wheels of vehicles comprising a dummy wheel mounted alongside the vehicle wheel, means allowing of lateral motion of said vehicle wheel upon its axle, a rising and falling bearing carrying said dummy wheel, and automatic operating and connecting means between said bearing and said vehicle wheel to raise and lower said dummy wheel.

899,061. Vehicle Tire. Robert M. Merriman, Youngstown, Ohio. Filed March 13, 1907. Serial No. 362,167.

The herein described reinforcing cable for rubber tires, the said cable consisting of a plurality of metal and textile strands, the metal strands being twisted together and the textile strands being twisted and interwoven so as to completely cover the metal strands, the cable being saturated with a rubber cement which penetrates the textile strands so that when the cable is embedded and vulcanized in the tire the reinforcement and tire are practically inseparable from each other.

899,109. Carburetter. Frank H. Heitger, Indianapolis, Ind., assignor to Speed Changing Pulley Company, Indianapolis, Ind., a Corporation of Indiana. Filed May 16, 1906. Serial No. 317,162.

1. In a device of the class described, a reservoir containing a central vapor tube

Common Sense Plug

Said to be the best plug made. In all threads. Price, $1.00.

opening through its bottom and extending above its top, in combination with a suitable nozzle communicating with the reservoir and located in the lower part of said tube, a suitable cover or top for said reservoir through which said tube extends, a mixing chamber having an opening in its bottom and arranged above the top of the reservoir, said mixing chamber having a suitable outlet, and an automatic air admission valve arranged about the upper end of said vapor tube for closing the inlet opening in said mixing chamber, substantially as described.

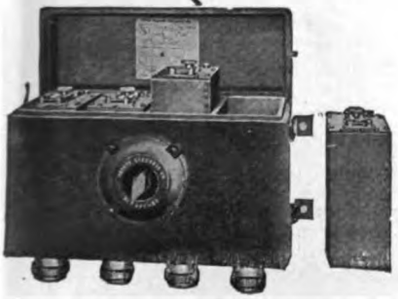
899,126. Spare Tire Holder. Leo P. McKinney, Boston, Mass., assignor of one-half to John L. Snow, Boston, Mass. Filed Dec. 31, 1907. Serial No. 408,768.

1. A spare tire holder provided with a head having a tire engaging portion presenting a broad tire engaging surface, and means for securing the tire against said surface comprising a strap passing directly and completely around both the tire and said tire engaging portion.

899,139. Cushion Tire. John G. Smith, Wahoo, Neb. Filed March 18, 1907. Serial No. 352,898.

1. A cushion tire comprising a rim having a series of radially movable spring cushioned tread elements arranged thereabout in openings therein, and each comprising an outer approximately U shaped member with an inner reinforcing member secured thereto, and a plurality of spring pressed plungers secured at one end to each of said tread elements and operable at their other ends in said rim.

899,283. Power Transmission Device. Stead A. Asquith, Waterloo, Iowa. Filed July 27, 1907. Serial No. 385,855.



1. A device of the character described, comprising in combination, a rotatable driving shaft, a friction wheel mounted thereon, a rotatable driven shaft, a main friction disc slidably but non-rotatably mounted thereon, side friction disc rotatably mounted with their inner faces in juxtaposition to the circumferential bearing edges of both said friction wheel and main friction disc, and means for causing said side friction discs to bear equally upon the edges of said friction wheel and main friction disc.

Cure Ignition Trouble!

The Remy 1909 high tension Magnetos can be installed with almost any standard automobile motor without difficulty. We furnish fittings for many of the leading automobiles.

The Remy 1909 Magneto provides for a double system of ignition with one set of spark plugs. The Magneto switch furnished with the Magneto is fitted with a push button for starting the motor upon the spark without cranking, where dry batteries are wired in connection with the Magneto.

The Remy 1909 Magneto excels particularly in that it is more simple than any other ignition apparatus. Satisfactory results are assured with it, whether the user of the car be an experienced mechanician or knows nothing about his car. It will stand more abuse from water, oil, etc., on account of its broad margins for safety and its less delicate and less sensitively adjusted parts.

On account of the extra hot spark furnished by this Magneto and the perfect timing of the gear driven Magneto, from 5 to 25 per cent. more power is secured than where a vibrator coil and storage batteries are used.

More Remy Magnetos Sold for 1909 Cars Than All Other Makes Combined

Expense has not been spared in the construction of our Magneto to make it thoroughly high grade and the best apparatus of its kind on the market. This is proven by the volume of business we are doing and the successful cars with which our Magnetos are regularly equipped.

The following are some of the regular quantity users of our Magnetos:—

Buick Motor Co.	**Overland Automobile Co.**	**Olds Motor Works.**
Maxwell-Briscoe Motor Co.	**Cameron Car Co.**	**Kissel Motor Car Co.**
Apperson Bros. Automobile Co.	**Midland Motor Co.**	**Nordyke & Marmon Co.**
Model Automobile Co.	**Regal Motor Car Co.**	**Buckeye Mfg. Co.**

The Remy Magnetos are not only used upon automobiles, but upon almost all kinds of explosive engines. They are used upon the powerful engines operating the big gang plows in the West, with the 200 horsepower gasoline cars of the Union Pacific Railroad, and upon many other big motors that are entirely dependent on the reliability of the motor for their success.

Write us for illustrations and full description of our new high tension Magneto. We are building them in such large quantities that we can make you attractive prices. We can very likely furnish you fittings for attaching the Magneto to your automobile, or almost any garage could install it without the fittings. Ask for it upon your new car if you want the best.

Remy Electric Co.

The MAGNETO It's FUN TO OWN

UNTERBERG & HELMLE

THE SELF-STARTING DEVICE OF THE UNTERBERG & HELMLE MAGNETO.

What It Means

It means a spark of maximum intensity—the same spark as at racing speeds—on the slowest turn of the starting crank.

It means that this intense starting spark is automatically retarded past the dead center. No matter what the position of the spark lever, the spark occurs at the same safe point. Back kicks and broken wrists are impossible with the U. & H. "Type LE."

It means, not simply an easier start than is possible with the ordinary sort of magneto, but a surer start as well. When the engine is warm, you start on the gas already in the cylinders—you don't have to pump it out by spinning and take your chance on what the carburetor may give you. Half a turn and you are off.

And the Self-Starting Device is absolutely simple and rugged. It is built to last as long as the rest of the magneto.

Type LE—the Self-Starting Magneto.
Type LB—without the self-starting device.
Type CB-4—for 4-cylinder motors up to 30 H. P.

New Series TIMKEN Short Bearings

In offering the Automobile trade our **New Series Timken Short Bearings,** we do so with the assurance that they are made from the same carefully selected steel and subjected to the same severe tests as our standard size Bearings.

The **New Series Short Bearings** are designed for use in axles where the bearings space does not permit the use of our regular series.

These Short Bearings can be used on any axle, transmission, or other places where Annular Bearings can be used. They carry **a much greater load** than Annular Bearings of the same length, **are smaller in diameter** and in addition will take as much **end thrust** as they do **radial load.**

Every bar of steel entering into **Timken** Products is made to the **Timken** analysis chemically—and tested to the **Timken** test physically—which means a rejection of **45 per cent.** of every ingot before metal of suitable density and soundness for **Timken** Roller Bearings can be obtained. These new Short Bearing Rollers are made from best nickel steel.

This is one reason why **65 per cent.** of the makers of high-grade Automobiles and over **90 per cent.** of the commercial truck builders of this country use **Timken** Roller Bearings. **WRITE FOR CATALOG AND PRICES**

The car you cannot afford not to own—

"The Maxwell"

"The aristocrat of moderate priced cars"

The Car with the 5 Bearing Crank Shaft

Model D. A. 30 H. P. $1,750. One of the five Maxwell models.

You see them everywhere these Maxwells—the car with the brass band across the radiator.

What has caused this success, for surely 12,000 Maxwells running from Maine to California is indisputable proof of popularity. This season brings its quota of new makes—yet to be tried—but the Maxwell stands proved—stands squarely on its reputation of making good. Three factories representing one million and a half dollars worth of equipment will this year make 9,000 Maxwells.

NO OTHER CAR THAN THE MAXWELL COMBINES ALL THESE FEATURES IN A SINGLE DESIGN.

Thermo Syphon Cooling. No pump.
Unit Construction.
Three-Point Suspension.
Multiple Disc Clutch.
Shaft Drive.
Indestructible Metal Bodies.

These were originated in the Maxwell and have been an integral part of its construction since 1904.

I want to get in personal touch with you to recommend one of the five models which fits your case.

A postal will bring our catalogue. Send for it to-day —NOW.

Benj. Briscoe
President.

Maxwell-Briscoe Motor Co.

P. O. Box 106, Tarrytown, N. Y.

Factories: New Castle Tarrytown Pawtucket

"Firestone"

NON-SKID TREAD

Composed entirely of rubber. Formed by the raised lettering "FIRESTONE NON-SKID" arranged obliquely across the tread surface.

Contains more angles, edges and points of road contact than any other non-skid.

Spaces in and between the letters cause a suction that grips the road and prevents slipping.

The wear-resisting quality of this tread is a revelation to motorists accustomed to the quick wearing down or tearing out of the ordinary non-slip devices.

THE MARMON
"A Mechanical Masterpiece"

Marmon "Thirty-Two"
$2400

For The Man Who Doesn't Buy With His Eyes Shut

The Marmon "Thirty-two" is neither a cheaply-built car at a low price, nor a "good-enough" car at a high price.

It is a thoroughly high-grade car, carefully built and completely equipped, at a price which makes it the best real bargain of the year.

It is a car of whose character, appearance, and performance its owner may well be proud. It is a car that will live and can be depended upon. The Marmons of 1904 are still giving splendid service.

Equipment and Marmon construction considered, it urges a careful investigation by every buyer who is really economical.

Genuine Krupp and Chrome Nickel steels used in important parts. Bosch magneto and battery—dual system. Hess-Bright imported ball bearings. Weight (weigh it), 2,000 lbs. 32-40 H.P. Big tires (34x40 all around). Large brakes. Straight line shaft drive. Fully equipped. Touring car, Roadster, Suburban with removable rear seat, Coupe or Limousine Town Car.

TO DEALERS: This car is a winner. Your competitors will have to take off their hats to it.

The superb Marmon "Fifty" (with Seven-Passenger Body), $3,750.

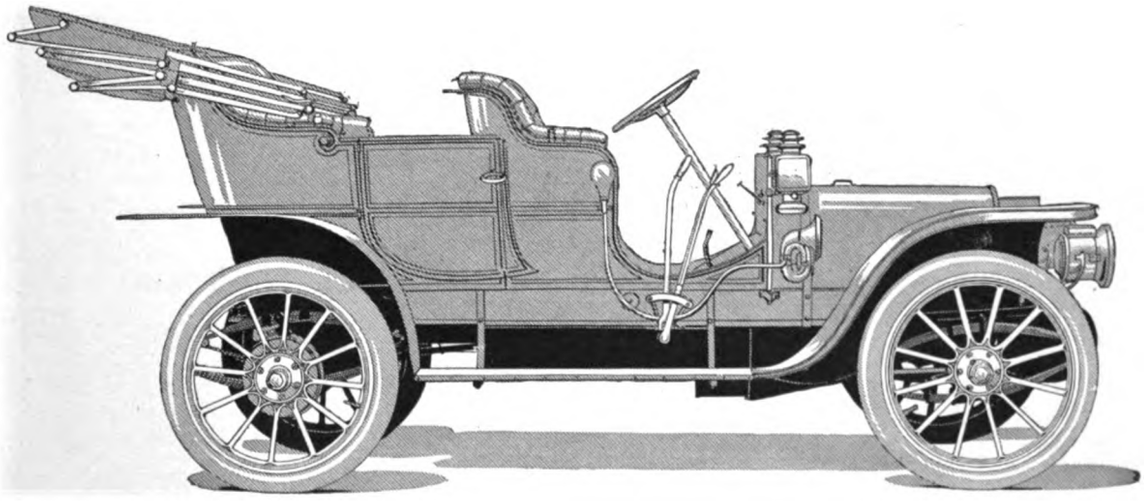
The Easiest Riding Car In The World

Digitized by Google

A Franklin automobile made the only perfect score among fifteen entrants — all the others water-cooled — in the 210 Mile reliability run over the worst roads about Worcester, Mass., December 12. A blinding snowstorm increased the difficulties.

You think you know what a comfortable automobile is, but do you realize all that comfort means? Do you know what makes it?

Every Franklin automobile has four full-elliptic springs hung so that they take up road shocks from every direction, not merely up and down—very few road shocks are directly up and down. These springs have a "movement" of 5⅞ to 6½ inches. The ordinary half-elliptic spring can move only two or three inches before the frame bumps.

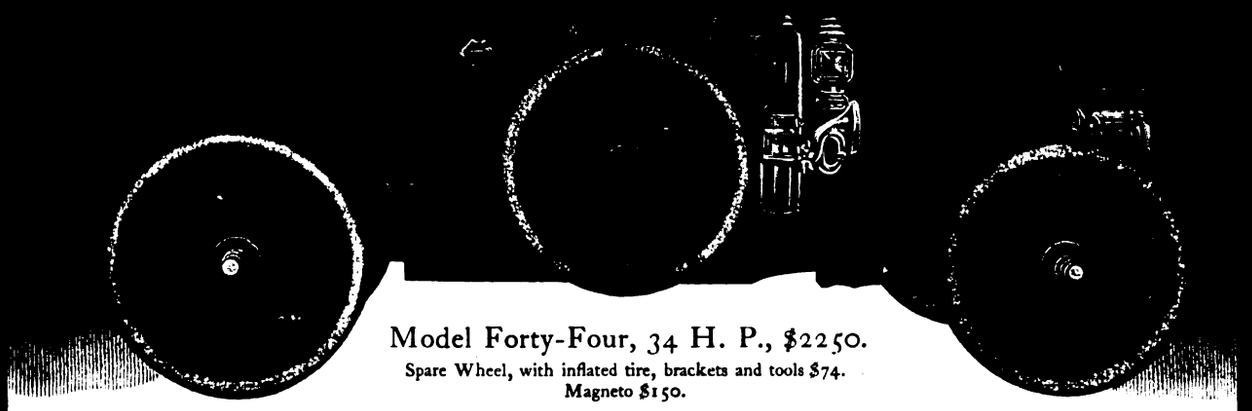


The Franklin laminated wood frame is a natural and scientific shock-absorber. It does not transmit shocks as a metal frame does. And every Franklin model has the largest wheels and tires in proportion to its weight. Large wheels help to make any vehicle ride easier. Everybody know that.

All this does away with jolting and jarring and vibration. It gives a luxurious riding-quality that you cannot get except in a Franklin automobile. And a light-weight automobile does not pound on the road.

Some makers of heavy automobiles declare that when their machines strike a bump in the road, they do not "bounce." This is probably true. Certainly the road does not give away to accommodate them. The question naturally arises: If the shock goes neither into the air nor the ground, where does it go? How much of it can possibly be absorbed by the steel frame and half-elliptic springs? How much is turned into a hard merciless "thump" and transmitted through the machine and to the passengers?

Ride in any heavy automobile over any road you choose.



Then ride over the same road in a Franklin.

Franklin Model D five-passengers, 36-inch wheels, 106-inch wheel base. 2200 pounds. $2800. F.o.b. Syracuse. (Top extra.)

H H FRANKLIN MFG CO., Syracuse, N Y

Model Forty-Four, 34 H. P., $2250.
Spare Wheel, with inflated tire, brackets and tools $74.
Magneto $150.

THE SAFETY SPARK RETARDER

There is absolutely no danger in cranking a Rambler when properly adjusted. The starting crank then cannot engage until the spark has been automatically retarded.

Every one who has had the unpleasant experience of a premature spark in starting an automobile will appreciate the Rambler safety starting device. This prevents an explosion ahead of center, even though the operator forgets to retard the spark.

You cannot engage the lug on the shaft with a tooth on the starting crank until the spark-retarder lever has moved from the position of the dotted line to the position shown, thus retarding the spark.

Rambler

The Car with the Offset Crank Shaft

Seven passenger model, forty-five horse power with offset crank shaft, $2500. Other models, $1150 to $2500. Write for catalog describing in detail Rambler offset crank shaft, Spare Wheel, straight line drive and other exclusive features of the new Rambler models.

THE MOTOR WORLD

Volume XIX. New York, U. S. A., Thursday, December 24, 1908. No. 13

GENERAL MOTORS ASSUMES FORM

Olds and Buick Interests Form the Nucleus for New $12,500,000 Company—Par Value of Shares, One Dollar.

Despite numerous denials and considerable backing and filling, the General Motors Co., the much-rumored, mammoth, merger, holding company, is in being, having for its nucleus the Olds Motor Works of Lansing, and the Buick Motor Co., of Flint, Mich. The new company is incorporated under the laws of New Jersey and has a capitalization of $12,500,000, divided into $1 shares. While it has not yet come right out publicly and announced its existence and proposed program of operation, the stockholders of the Olds Motor Works have already been approached on the subject of trading in their Olds holdings for shares of the General company, on a basis which is calculated to occasion some surprise to those not familiar with the inside history of the affair.

Most surprising of all is the proposal that the Olds stockholders trade in their shares for 50 cents on the dollar so far as face values are concerned. For each share of Olds stock, the par value of which is $10, the new company is willing to exchange four shares of its preferred and one share of its common stock, the five shares together having $5 face value. Three-quarters of the total Olds stock is said to have been arranged for on this basis, and the scattered holders whose shares make up the remaining quarter are expected to see the light in due time.

The total capitalization of the new company is divided into $7,000,000 preferred stock, paying 7 per cent. cumulative dividends, and $5,500,000 common stock, each dollar representing a share. The division of the shares into such small financial units will make easy the distribution of a large portion of them to the general public in parcels to suit every purse. No town or hamlet will be so small but what its residents, through the local bank, can obtain some of the coveted stock, the fame of which will not suffer through any inadequate preparatory work.

As announced in the Motor World, the Buick and the Olds companies some time ago reached a most cordial understanding, even to the extent of the Buick company making the chassis for one of the Olds models, so that the confirmation of the rumors associating the two companies was not unexpected.

While the general facts concerning the enterprise are apparently widely known in Michigan and elsewhere, a great air of secrecy is still maintained at the office of the New York law firm having in charge the delicate task of launching it. In this work Attorney Curtis R. Hatheway is credited with much of the responsibility, he being an associate of Ward, Hayden & Satterlee, who have been mentioned prominently in connection with the previous merger flurries. When asked by the Motor World for the completed details he was more than cautious about even admitting the existence of the General Motors and declared that information concerning the participation of the Olds and Buick companies could not be given out "until the proper time."

Jackson Prepares to Produce Cars.

R. B. Jackson, formerly general manager of the E. R. Thomas Motor Co., of Buffalo, N. Y., has leased the factory in Detroit, Mich., formerly occupied by the Northern Motor Car Co., and is preparing to produce cars. As yet the plans in this connection are shrouded in some secrecy, but it is known that steps for the organization of a company have been practically completed. Quotations have been asked on power units and other parts, indicating that the output will be an assembled product.

Bosch Takes a New Building.

The Bosch Magneto Co., of New York, has moved to a new building at 223-225 west Forty-sixth street. The change was necessitated by increased business.

APPERSON CLINCHES HIS CLAIM

He Fortifies the Alleged Basic Patent on Multiple Ignition System—Will Now Assert His Rights.

An explanation developed this week as to why Elmer Apperson, of the Apperson Bros. Automobile Co., Kokomo, Ind., has not more vigorously asserted the strength of the alleged basic patent on multiple ignition for explosion engines which he purchased about two years ago and of which the Motor World gave a complete account at the time. Instead of weakening in his confidence as to the patent and its importance, Apperson has in the interim been further fortifying his position by taking out an additional patent of his own along the same lines, the latter patent being issued to him on the first of this month. Armed with the two, he proposes to notify all manufacturers, importers and dealers in the United States of the rights which he holds, and to prosecute those infringers who cannot otherwise be brought to a satisfactory adjustment.

The later patent is No. 905,625, filed July 3, 1906, and issued to Elmer Apperson on December 1, 1908, and dovetails with Patent No. 617,560, filed August 26, 1897, and granted to Ferdinand E. Canda, of New York, January 17, 1899, which Apperson bought on the advice of Thomas F. Sheridan, an eminent patent attorney. These patents cover broadly the use of two or more separate igniting devices provided with separate circuits with means for throwing the devices into or out of action simultaneously or independently, as well as covering the use of two or more spark plugs or sparking points having electrical connection with the magneto and battery with means for throwing the spark plugs or points into and out of operation.

It is claimed that the Apperson brothers were among the first in American to use what is termed the double independent sys-

Digitized by Google

tem of ignition. After working some years to perfect this system, Elmer Apperson filed application for a patent, but it was found that the Canda patent interferred with it. As a result, Apperson bought the Canda patent to clear the way for his own, the two combining as a monopoly on this phase of automobile ignition.

The claims of the Canda Patent were given in full in these columns at the time of the purchase. Those of the Apperson patent just granted are as follows:

1. An explosion engine having a cylinder in which the explosion is adapted to ignite, a pair of spark plugs extending into the cylinder, a magneto, electrical connections from the magneto to one of the spark plugs, a battery, separate electrical connections from the battery to the second spark plug, and a switch for throwing the spark plugs into and out of operation.

2. An explosion engine having a cylinder in which the explosive is adapted to ignite, a pair of spark plugs extending into the cylinder, one of said spark plugs having a fixed spark gap, a magneto electrically connected with one of the spark plugs, a battery electrically connected with the other spark plug, a periodic circuit interrupter in the connection to the spark plug having the fixed gap, and means to control the connections to the spark plugs.

3. An explosion engine having an explosion chamber with two spark plugs therein, a magneto electrically connected with one spark plug, a battery electrically connected with the other spark plug, adjustable timers in the respective circuits, and means for adjusting the timers similarly and simultaneously.

4. An explosion engine having a cylinder in which the explosive is adapted to ignite, a pair of permanent spark gaps within said cylinder, a magneto electrically connected to the terminals of one spark gap, a battery electrically connected to the terminals of the other spark gap, and circuit interrupting device in each of said connections.

5. An explosion engine having a cylinder in which the explosive is adapted to ignite, a pair of spark plugs extending into the cylinder, a magneto in circuit with one of said spark plugs, an induction coil having its secondary in circuit with the other spark plug, and a battery in circuit with the primary of said induction coil.

Commercial Motor in Receiver's Hands.

The Commercial Motor Truck Co., of Plymouth, O., has been put into the hands of a receiver by the common pleas court of Richland county. The action was brought by the J. D. Fate Co., also of Plymouth, creditor for about $5,500 in borrowed money. The liabilities are estimated at over $30,000, while the assets are still in doubt. The concern has recently been negotiating with Norwalk, O., and other towns, looking to a change of location if sufficient inducements were offered. A. M. Trago, a Plymouth banker, was appointed the receiver.

BUICK ATTACKS THE INDUSTRY

In Ostensible Appeal for Lower Tariff They Make Radical Assertions—"Ridiculous-Bad Management" One of Them.

In lime-light distinction from the body of American automobile manufacturers, W. C. Durant, general manager of the Buick Motor Co., appeared before the ways and means committee at Washington, on the 19th inst., and said that the import duty on automobiles should be reduced from 45 per cent. to 20 per cent., while the duty on parts should be raised to 50 per cent. He disclaimed against the "enormous profits and the ridiculously bad management" which the present rate of duty fosters, according to his view, and labored with the committee long and earnestly to persuade it that the reductions he asked for should be made.

Some sharp colloquies took place between members of the committee and the would-be tariff reducer, in which he was more or less roughly handled. When he began pressing the committee for concurrence with his opinions, he developed an outburst from Chairman Payne.

"Oh, so far as your argument about this excessive protection is concerned," said Mr. Payne, "the committee is convinced that the 20 per cent. you ask would be sufficient. But can't you give us figures as to what the effect of this reduction would be on the revenues of the Government? We are looking for articles that will be fit subjects for a high duty to counteract the annual deficiencies."

"I don't think it is right," replied the witness, "to make us come here and testify our sources of income out of our pockets."

"We didn't ask you to come," said Mr. Payne. "We said we would be glad to hear you. What we want is facts, and we don't seem to be getting them."

A question from Mr. Boutell drew forth an answer that came as a great relief to the protectionists on the committee. By a reference to former testimony on this schedule, Mr. Boutell said it was apparent that the Buick company was preparing to start a factory abroad. His direct question on the subject failed to elicit a direct response. He pursued his inquiries, with the following result, as given by the official record:

Mr. Boutell—I asked if it was the intention of the Buick Motor Co. or parties in interest in it to build an automobile factory in Europe?

Mr. Durant—At this moment I could not answer that question, yes or no.

Mr. Boutell—There is no use fencing with the committee. If you do not want to state you need not, but it was stated here by your attorney that it was contemplating building a factory in Europe. That may explain what would otherwise be unintelligible, why you wanted a reduction in the duty, and I simply asked you, as the general manager, whether that was true. With the reduction in the duty, and the difference between the ocean rates and the railroad rates it would be apparent that there was a very good business reason for your advocating a lower duty.

Mr. Durant—It would not be likely that we would want to destroy our own home trade by reducing the tariff to permit of our manufacturing abroad, where we have no special interest.

Mr. Boutell—But that is not answering the question, whether you expect to begin manufacturing abroad or not.

Mr. Durant—No, sir.

The Chairman—We have heard the gentleman for half an hour; we have not been able, in the last five minutes, to get any facts out of him. He approves of the statement of Mr. Joy, so far as the facts are concerned. I do not know why we should lose any more time Saturday afternoon, and therefore we will excuse you, if you will allow us to. (Laughter.)

Mason Motor to Reorganize.

Re-organization of the Mason Motor Car Co., of Des Moines, Iowa, will soon be effected, together with an increase in the capitalization from $50,000 to $250,000. The change will alter the name of the concern to the Mason Automobile Co., and A. B. Shriver, a Winterset banker, will probably be made president, E. R. Mason will give his entire attention to the sales management while F. S. Dusenberg will have charge of the manufacturing end.

Banks Bid in the Dolson Plant.

The sale of the property of the bankrupt Dolson Automobile Co., of Charlotte, Mich., on the 14th inst., was of doubtful success. Some complete cars were disposed of to one bidder, while another took some of the parts and junk, but three of the local banks bid in the plant and other property to protect their loans, as cash customers were lacking. It is estimated that ultimately the Dolson creditors will get about 15 per cent.

Coats to Manage Lexington Company.

Fred N. Coats, of Dayton, O., has been selected as general manager and secretary of the newly incorporated Lexington Motor Car Co., which is shortly to begin the manufacture of cars in Lexington, Ky. For over two years he has been assistant sales manager of the Dayton Motor Car Co., of Dayton.

Packard Elects Walton General Manager.

At a recent meeting of the Packard Motor Car Co., Detroit, Mich., the following officers were elected: H. B. Joy, president; R. A. Alger, vice-president; Philip McMullen, treasurer; S. D. Waldon, general manager. The promotion of Mr. Waldon from sales manager to general manager is very gratifying to his many friends.

WHY HE FAVORS REDUCED TARIFF

Durant's Contrary Attitude Causes Discussion—"Spite Work" and Shrewd Campaign Among Allegations.

Although it has been stated that his appearance before the Ways and Means Committee at Washington to urge a reduction in the tariff on automobiles is due to intention to establish a factory abroad, this is not the generally accepted reason for the attitude assumed by W. C. Durant, the directing head of the Buick Motor Co.—an attitude which directly is at variance with the practically unanimous sentiment of the remainder of the trade and opposed to the fact that Durant himself has advanced the list price of at least one of his models.

"Spite work" is the opinion expressed by a number of those who know him. "A play for gratuitous advertising" is the belief held by others who know him better. "An effort to pave the way for the unloading of the General Motors Co.'s $1 shares on the dear public" is a third explanation that has been advanced.

Those who hold the "spite work" opinion ground it on the bad standing of the Buick Motor Co. in the Association of Licensed Automobile Manufacturers due to its failure to meet its obligations and pay its royalties for nine months or more and which has caused the doors of both of the New York shows to be closed to Durant's concern.

"Personally, I do not believe that Durant at heart either wants or believes that the tariff will be reduced," is the way one man in the trade voiced his views. "He simply is trying to 'get even' with the A. L. A. M. by endeavoring to hurt its members by increasing the volume of competition from abroad and is so fixed in his determination to do so that apparently he doesn't care who else he hurts."

Durant's reasons for refusing to meet the Buick obligations to the Association is one of the things that has been difficult of understanding as it is a matter of general belief that no other concern has profited so greatly from membership. As Buick is one of the very few members who produces a cheap car, the exclusive agency policy of the A. L. A. M. has assisted in getting it a reputation and to "simply walk into business," as it once was expressed.

"Durant's refusal to live up to his contract is purely a matter of cold blooded deliberation," remarked a man of prominence in discussing the subject. "Apparently he believes that he has obtained from the A. L. A. M. all that he can obtain and now figures that if the Selden license is not sustained by the court he will be ahead the amount of his company's default, while if it is upheld all he will be obliged to pay will be the amount of royalty exacted from all other manufacturers based on the figures now exacted and which his company contracted to pay, but has not paid."

"But has not the Buick company rendered itself liable for breach of contract?" was asked.

"Undoubtedly. But Durant already has been hit upon his defense. He will allege that the A. L. A. M. has not done all that it agreed to do and that therefore he was induced to become a member by misrepresentation."

Whether the fact that Buick became a member not by direct election, but by purchase of the license of a retiring member—the Pope-Robinson company—has a bearing on the subject remains to be seen.

"Bless your soul," laughingly exclaimed another man when Durant's appearance at Washington in the role of tariff reducer was mentioned. "Are not you people in the newspaper business 'onto' Durant's game? He simply is 'working' all of you, daily papers and weekly ones. He believes in advertising, but not in paying for it. He doesn't even believe in hiring a press agent. He considers that he is his own best press agent. 'Do something spectacular and the —— — —— will be forced to notice you,' is the remark I've heard attributed to him several times. I am told that before one of the recent big road races Durant told some of his intimates that he would show them how to do it. At any rate after the finish of this race, which his car did not win, he made a spectacular display of his roll and peeling off $500, he presented it to his driver in front of the press stand. The Associated Press and some of the automobile papers 'fell' for the grandstand play and scattered news of it broadcast. 'Didn't I tell you I'd make the —— — —— notice me?' Durant is said to have exultantly remarked to his intimates a few days later. Durant is a mighty shrewd man and to my way of thinking, in apparently opposing the practically united trade by appearing before the tariff committee at Washington he merely is doing the spectacular and getting a lot of free advertising at the newspapers' expense. Any time he buys advertising space, it is well to look behind it."

That his tariff attitude is part of the game to help sell the stock of the General Motors Co., which he engineered, is not so evident, but there are those who, nevertheless, believe such to be the case.

They point out that Durant is no stranger to stock market operations. For some time he maintained an office in New York in the Wall Street district. The fact that the General Motors stock is to be offered in $1 shares indicates plainly that they are for public consumption and those who hold the stock market view of Durant's attitude point out that anything which serves to impress the name Buick on the public mind will serve to further the sale of the merger's stock; for Buick has enjoyed a prosperous year and will be able to make a tempting showing in any prospectus which may be issued. These people argue that the establishment of a great chain of Buick branches including the big cities and almost innumerable small ones where the prospect of enduring profit would seem doubtful is but another move in the shrewd campaign to sell the General Motors stock. During the past year Buick, they say, has made a specialty of courting the favor of small banks. The company has borrowed freely, and though it may have defaulted payment of Selden royalty, it has promptly met all banking obligations and thus become a desirable credit. Its paper is in demand by the small banks and the report is current that from some source or other they have been confidentially tipped off that they will be wise if they get in early and avoid the rush for General Motors stock. As a result, it is said that more than a few country bankers have visited Buick headquarters and that the knots in the strings of their dough bags have been considerably loosened in order to promote quick action at the proper moment. In sequence, the greater the number of Buick branches the greater the number of small banks in which Buick money will be deposited and the greater the radius of Buick influence and the wider the market for General Motors shares.

Cuba a Market for American Cars.

According to William Mitchell Lewis, president of the Mitchell Motor Car Co., who has just returned from a brief trip to Cuba, the market for American motor cars of medium price may be expected to develop a very decided increase in that quarter within the next few months. He even predicts that during the coming year over 50 per cent. of the cars shipped to Cuba will be of American manufacture, whereas in the importations of the past they have not exceeded 10 per cent. of the total number. The old condition of things was largely due to a lack of American agencies in Havana. James W. Gilson, sales manager of the Mitchell company who accompanied Mr. Lewis was even stronger in announcing his convictions of the Cuban possibility.

"Cuba affords one of the best fields for the medium-priced American car," he said. "The tobacco and sugar planters are coming into their own again, and they are willing to spend money. The Cuban roads are on a par with our best boulevards, but the planters have been using horses to ride from their plantations to their homes. Their use of the horse for pleasure purposes will be a thing of the past in a few years.

Enlarging New Process Factory.

After two months of night work in its plant, the New Process Raw Hide Co., of Syracuse, N. Y., has contracted for an extensive addition to its factory. The building, which will be of steel, brick and cement, will consist of two stories and a basement, yielding 13,000 square feet more floor space.

The Week's Incorporations.

Steubenville, O.—Automobile and Motor Boat Co., under Ohio laws, with $10,000 capital.

Detroit, Mich.—Crescent Motor Co., The, under Michigan laws. Increase of capital from $55,000 to $125,000.

Billings, Mont.—Public Motor Co., under Montana laws, with $30,000 capital. Corporators—J. C. West, et al.

Cleveland, O.—Lake Avenue Automobile Co., under Ohio laws, with $30,000 capital. Corporators—Edward J. Hobday et al.

Janesville, Wis.—Pierson Garage Co., under Wisconsin laws, with $1,000 capital. Corporators—Roy Pierson, N. L. Carle and A. L. Avery.

New York City, N. Y.—Club Taxi Co., under New York laws, with $1,000 capital. Corporators—T. Hopkins, E. L. Mooney and J. J. Robinson.

New York City, N. Y.—Monarch Storage Battery Co., The, under New York laws, with $50,000 capital. Corporators—A. D. Thornburn, R. B. Hopkins, New York; R. W. Phelps, Buffalo.

Aurora, Ill.—Bell Carburetor Co., under Illinois laws, with $12,000 capital. Corporators—Henry H. Evans, Edward R. Conklin, and Charles E. Bell.

Oshkosh, Wis.—F. S. Hoaglin Auto Co., The, under Wisconsin laws, with $10,000 capital. Corporators—F. S. Hoaglin, A. E. Badger and L. O. Chase.

La Junta, Colo.—La Junta Automobile Co., under Colorado laws, with $10,000 capital. Corporators—R. S. Anderson, George H. Little, and Katie Posz.

Oklahoma City, Okla.—Fritz Brothers Auto Co., under Oklahoma laws, with $40,000 capital. Corporators—C. D. Fritz, E. J. Fritz and R. W. Yantis.

Greensboro, N. C.—Atlantic Motor Co., under North Carolina laws, with $25,000 capital. Corporators—H. L. Hopkins, L. B. Hopkins and Thos. S. Beall.

Paterson, N. J.—Ford Automobile Co., under New Jersey laws, with $10,000 capital. Corporators—Robert W. Bates, Geo. M. Dorwart, Jacob Vanderclock.

Salem, Mass.—Auto Lighter & Equipment, under Massachusetts laws, with $100,000 capital; to deal in automobiles. Treasurer, A. L. Messer, Salem, Mass.

Lexington, Ky.—Lexington Motor Car under Kentucky laws, with $50,000 capital. Corporators—Kinzea Stone, F. F. Bryan, John Osborne, J. P. Jackson, et al.

Milwaukee, Wis.—Monarch Motor Co., The, under Wisconsin laws, with $20,000 capital. Corporators—John Godfrey, William W. Welch, and Inez N. Welch.

Belfast, Me.—Read Garage & Machine Co., under Maine laws, with $10,000 capital. Corporators—C. E. Read, president; H. Chenery, treasurer; and R. I. Morse.

Brooklyn, N. Y.—Plaza Garage Co., The, under New York laws, with $5,000 capital. Corporators—Justin Bloch, Edgar Bloch and Alexander Clement, of Brooklyn.

Minneapolis, Minn.—Brown Emergency Tire Co., under Minnesota laws, with $100,000 capital. Corporators—Henry W. Nath, Lewis N. Klove and Theodore H. Brown.

Cleveland, O.—Western Reserve Motor Car Co., under Ohio laws, with $50,000 capital. Corporators—J. H. Price, R. B. Cason, G. L. Ginther, E. T. Smith and C. H. Bunde.

Cleveland, O.—Citizens Taxicab Co., under Ohio laws, with $50,000 capital. Corporators—Francis J. Wallace, J. Carr Brown, Frank L. Smith, George H. Jackman, et al.

Portland Me.—F. & D. Manufacturing Co., under Maine laws, with $400,000 capital; general automobile business. Corporators—C. E. Eaton, president; T. L. Croteau, treasurer.

Wilmington, Del.—Morgan Motor Car Co., under Delaware laws, with $500,000 capital. Corporators—E. L. Squire, K. M. Byrne and J. A. Byrne, of Wilmington, incorporating agents.

Rockford, Ill.—Standard Auto Co. of Rockford, under Illinois laws, with $10,000 capital; to deal in and repair automobiles. Corporators—S. O. Widell, John Wester and S. Leon.

Charlotte, N. C.—Mecklenburg Auto Repair Co., under North Carolina laws, with $5,000 capital authorized and $1,000 subscribed. Corporators—L. E. Davis, G. W. Webb and E. T. James.

Trenton, N. J.—Sharp Arrow Automobile Co., under New Jersey laws, with $125,000 capital; to manufacture automobiles. Corporators—William H. Sharp, Job R. Farlee, and Fred W. Bennett.

Brooklyn, N. Y.—Prospect Heights Motor Co., under New York laws, with $25,000 capital; to manufacture and deal in automobiles. Corporators—R. L. Kelly, T. F. Reilly and L. C. Howard.

Summit, N. J.—Summit Motor Car Co., under New Jersey laws, with $5,000 capital; to manufacture automobiles, bicycles and supplies. Corporators—Howard I. Day, Rosalie Nelson, Harry Baldwin.

Far Rockaway, L. I.—Savoy Auto and Taximeter Cab Co., The, under New York laws, with $30,000 capital. Corporators—Max Katz, L. T. Walter, Jr., Frederick Fitter, Robert Smith and A. W. Fitter.

New York City, N. Y.—Eureka Taximeter Cab Co., under New York laws, with $25,000 capital; to manufacture, deal in, and rent automobiles. Corporators—H. M. Browne, F. W. Mills and E. J. Forhan.

Joliet, Ill.—Van Guard Manufacturing Co., under Illinois laws, with $25,000 capital; to deal in and manufacture automobiles and general machinery. Corporators—Charles F. Jensen, Edward W. Steinhart and Nathaniel L. Hurd.

In the Retail World.

The Knox Automobile Co. has leased a new three-story building at 1458 Michigan avenue, Chicago, Ill. The contract specifies a five-year term.

The Strong Automobile Co., 109-111 East Walnut street, Des Moines, Iowa, will move to the west side of the river after January 1. The exact location has not been determined.

D. G. Meter, of Milwaukee, Wis., has leased the former Elite Stables on South Washington street, Green Bay, and opened a garage. He handles the local Reo business for that territory.

Fire in the garage of the C. M. Automobile Livery, 5 Park Row, Chicago, Ill., on December 17, destroyed five automobile. The loss, including damage to adjacent property was estimated at $10,500.

J. M. Skinner, of Lansing, Mich., has organized the Standard Auto Co., and will open a garage in the old Bijou building on Ottawaa street about February . He has secured the agency for the Oakland cars.

The Anderson Vehicle Co., Fond du Lac, Wis., purposes the erection of a 30x105 foot garage in connection with its present office and store building on West Second street. The plans call for a $20,000 outlay.

Rolvin S. Whitney, of Brunswick, has purchased from James W. Skene his garage at 88 Bates street, Lewiston, Me. Skene, who has held the business for over eight years, was the first automobile dealer in the State.

Harshberger & Jantze have rented the east room of the building occupied by Perry Bradley as a blacksmith shop in Seward, Neb., and will open a garage shortly. The firm was formerly in the automobile business at Aurora.

The Boston Branch of the Locomobile Co. of America has removed from its former location at 400 Newbury street to its new quarters at 589 Boylston street. The new location is within the exclusive precincts of Copley Square.

Harry C. Bacon, formerly with a local agency, has become identified with Mason B. Hatch, 729 Main street, Buffalo, N. Y. The latter is distributor of the Chalmers-Detroit cars for western New York and northern Pennsylvania.

Harry Corson, formerly with the E. R. Clark Automobile Co., Springfield, Mass., has taken the local Ford agency which was given up by the Norcross-Cameron Co. He is located in the garage on Winchester Square, formerly occupied by the Stowe & Coffer Automobile Co.

The S. H. Petersen Automobile Co., formerly located at 2253 Cottage Grove avenue, Chicago, have recently moved into the heart of the automobile district in that city and opened new quarters at 1229 Michigan avenue. Their representation is the Waverley electric and Gyroscope gasolene lines.

ANOTHER BLOW AT PRICE CUTTING

Weed Gets Second Court Decision Sustaining Right to Fix Quotations—How Patents and Copyrights Differ.

Another victory has been won by the Weed Chain Tire Grip Co., of New York, in its campaign to establish the right of manufacturers of patented articles to control the prices at which their products may be sold. The action was against the E. J. Willis Co., of New York, and has so far resulted successfully despite the recent decision in the so-called "Bobbs-Merrill Copyright Case" which has been hailed by price cutters as being a complete knock-out to the control of retail prices by manufacturers.

Having taken no lesson from the results of the successful Weed suit against the Times Square Automobile Co., of New York, for selling Weed chains at prices lower than those designated on the containing bags and on the metal tags attached to the chains themselves, the Willis company since that time and since the decision in the Bobbs-Merrill case, was found selling the Weed grips at cut prices. Upon notice it declined to desist, and when brought to task in the courts did not deny the practice, but asserted in defense that the chains were bought in the open market from others than the Weed company, and, further, that the Supreme Court of the United States, in the Bobbs-Merrill case, had held that the copyright law is not broad enough to protect the retail price designated in the conditional sales notice printed in a copyrighted book, the Willis attorney advancing the hypothesis that the retail price on patented articles could not be maintained in the face of this decision.

The difference between patented and copyrighted articles, however, was made plain by a quotation from the United States Supreme Court in the case of Bement & Son vs. National Harrow Co., as follows:

"The very object of these laws (the patent laws of the United States) is monopoly, and the rule is, with a few exceptions, that any conditions which are not in their very nature illegal with regard to this kind of property, imposed by the patentee and agreed to by the licensee for the right to manufacture or use or sell the article, will be upheld by the courts. The fact that the conditions in the contracts keep up the monopoly or fixed prices does not render them illegal." . . . . "The provision in regard to the price at which the licensee would sell the article manufactured under the license was also an appropriate and reasonable condition. It tended to keep up the price of the implements manufactured and sold, but that was only recognizing the nature of the property dealt in, and providing for its value as far as possible. This the parties were legally entitled to do. The owner of a patented article can, of course, charge such price as he may choose, and the owner of a patent may assign it or sell the right to manufacture and sell the article patented upon the condition that the assignee shall charge a certain amount for such article."

Although Judge Coxe, of the United States Court of Appeals of the Second Circuit of New York, was one of the judges before whom the Bobbs-Merrill case came in its progress when it was decided that the copyright law was not broad enough to protect the retail prices on copyrighted books, in the case against the Willis company he declared for the plaintiffs, stating that he felt "constrained to follow this (Weed vs. Times Square Co.) decision," and granting a motion on November 20 for a preliminary injunction.

Odd Cause of a Garage Fire.

That a gasolene can in bad condition is a very dangerous affair and that an iron stove in the vicinity is equally hazardous when it contains live coals, was demonstrated on Sunday last, 20th inst., when a bad fire occurred at Brighton, Mass. Two frame buildings and their contents, among them nine automobiles, were destroyed by flames and an explosion, and adjacent property damaged, as a result of a mishap which happened when Harry Gavel was carrying gasolene through his frame garage on Beacon stret. It seems that while walking past the stove, the handle on the 5 gallon tank broke off, causing the tank to drop to the floor and splash the gasolene. The building was instantly in flames and Gavel, who endeavored to get some of the cars out of the place, was badly burned. His stock of four automobiles was totally destroyed.

The damage to property owned by various persons, was estimated at $25,000, which points out a moral regarding open grate stoves in frame garages.

Louisville Prepares for a Show.

To hold an automobile show in Louisville, Ky., the dealers have organized themselves into the Louisville Automobile Dealers Association, with a complete paraphernalia of constitution and by-laws. Prince Wells has been chosen president; E. G. Reimers, vice-president, and Hubert Levy, secretary-treasurer. The show will be held April 15, 16 and 17, in the Coliseum.

Rambler Manager for Cleveland.

George Patterson has been selected to manage the branch of Thomas B. Jeffery & Co., in Cleveland, O. For the present the Rambler headquarters will be at 2158 E. Ninth street, but will probably be located on Euclid avenue a little later.

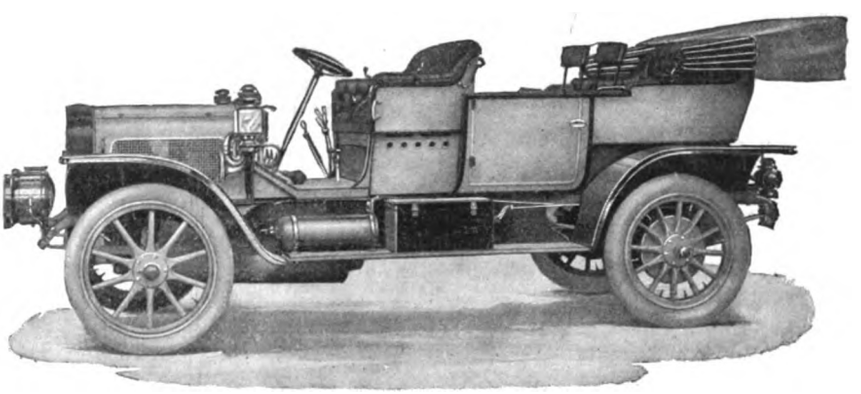
Death of President A. W. Tobin.

A. W. Tobin, president of the Continental Motor Co., of Muskegon, Mich., died in Chicago on the 13th inst. His death was caused by quick pneumonia.

NEW POPE COMPANY ORGANIZES

Directors Elect Board of Officers Headed by Albert L. Pope—Creditors of Old Company Paid in Full.

Final transfer of the property, business and assets of the old Pope Mfg. Co. to the reorganized company took place on Wednesday, the 23d inst., on which date checks for a final payment with interest at 6 per cent. were also sent to all the creditors having approved claims against the old company. The order for the transfer was received from the New Jersey court the day before. At a meeting of the directors of the new company, held in New York City late last week, the officers were chosen, with Albert L. Pope as president; Charles E. Walker, vice-president; Colonel George Pope, treasurer; Wilbur C. Walker, secretary, and Ezra M. Cutting, assistant treasurer. Harry Bronner was elected chairman of the board of directors and the firm of Joline, Larkin & Rathbone made general counsel.



The payment of the creditors' claims with interest for the period of delay marks a triumph for the receivers, Albert L. Pope and George A. Yule, in completely carrying out the task that they set for themselves when the duties of straightening out the old company's affairs devolved upon them. The reorganized company, with its manufacturing concentrated at Hartford, Conn., and Westfield, Mass., is in a position to go forward on the most successful lines, the prosperity and future of the concern having been well conserved during the receivership. The new Pope Mfg. Co. thus takes up its career enjoying the most favorable regard of the trade and with its factories more than busy on production for which markets have been assured by enterprising preparation.

Non-Freezing Mixtures that are Taxable.

Dealers preparing a stock of "non-freezing mixture" for the use of their customers have reason to be careful both as to the quantity and the constituents of the compound, as otherwise they are likely to come into contact with the United States government internal revenue officers. The commissioner of internal revenue at Washington, has just rendered a decision to the effect that a special government tax must be paid by dealers or garage proprietors who keep on hand for sale any "non-freezing mixture" which contains even so much as 30 per cent. alcohol. The commissioner, if he knows it, will not permit dealers in automobile supplies to put on the market any new, intoxicating drink which as "non-freezing mixture," might find popularity with thirsty chauffeurs in prohibition States. The decision was given at the request of the collector at Boston.

THE
MODEL "M" WHITE STEAMER
Is The Most Luxurious Car On The Market

The luxury of the White Steamer is unequalled by any other machine. There is no car, however expensive, which has better upholstery, better springs or better finish. Owing to the compactness of the mechanism, the body is much more commodious than in any car of similar wheelbase, (122 inches). Few other makes have such a liberal tire equipment (36 x 4 on the front wheels and 36 x 5 on the rear wheels.)

The luxury of any car, however, depends largely upon its riding qualities and here the White is "in a class by itself." It is the only car where starting and changes of speed can be effected without jerks or jolts. It is the only car which runs noiselessly under all conditions. It is the only car which is free from vibration, because it is the only car where the power is applied evenly and continuously, and not spasmodically.

Just as our Model "M," priced at $4,000, is the most desirable of the higher-priced cars, so our Model "O," at $2,000 predominates among moderate priced machines.

Write for descriptive matter.

THE MOTOR WORLD

Published Every Thursday by

The Motor World Publishing Company

Joseph Goodman, President. R. G. Betts, Treasurer.
F. W. Roche, Secretary.

154 Nassau Street
NEW YORK, N. Y.

TELEPHONE 2652 BEEKMAN.

Subscription, Per Annum (Postage Paid) . . $2.00
Single Copies (Postage Paid) . . . . . 10 Cents
Foreign and Canadian Subscriptions $3.00

Invariably in Advance.

Postage Stamps will be accepted in payment for subscriptions, but not for advertisements. Checks, Drafts and Money Orders should be made payable to THE MOTOR WORLD PUBLISHING CO.

General Agents: The American News Co., New York City, and its branches.

☞ Change of advertisements is not guaranteed unless copy therefor is in hand on SATURDAY preceding the date of publication.

To Facilitate Matters Our Patrons Should Address us at P. O. Box 649.

Cable Address, "MOTORWORLD," NEW YORK.

Entered as second-class matter at the New York Post Office, November, 1900.

NEW YORK, DECEMBER 24, 1908.

" . . . . By the way, I like the Motor World. It gives the kind of stuff the dealer wants to know, and you ought to hold your own long after the general public stops reading automobile papers."
NEW YORK SPORTING GOODS CO.,
James E. Murray, Secretary.

The New York Show Numbers of the Motor World will bear dates of December 31st, January 7th, 14th and 21st, respectively. The first two will interestingly and comprehensively forecast and describe the exhibition of American Motor Car Manufacturers Association, and the other two do similar duty for the show of the Licensed Association of Automobile Manufacturers. As usual, the Motor World's reports of both shows will deal with goods actually exhibited and will not comprise mere trade puffs or extracts from catalogs written weeks before the doors of the exhibition halls are opened.

About Attendants at the Shows.

As the show season approaches it is well to voice a plea on behalf of the show visitor, be he the casual and curious lounger, the potential customer or the minor tradesman seeking information which is of personal interest to him. It is a sad part of show history—perhaps an indispensible part—that not a few of those who are placed in charge of exhibits frequently display a blend of indifference and ignorance concerning the wares of which they are in charge at once discouraging and disheartening to encounter. Indeed so great has been the evil in former years that it has excited repeated comment during the show season and afterwards. Because there is a reason for the poor attention shown to many visitors, however, and because there is a remedy for it, it is regrettable that the evil should be permitted to continue.

Indifferent stand attendants may be divided into two classes. The eager and ignorant class, who are obviously taken on only for the show and have not been sufficiently trained in their line, and the experienced but lofty and preoccupied men, who are too busy with their own affairs to attend properly to the wants of the stranger.

It should be added that as the shows draw to a close and all who form a part of their human element are thoroughly wearied of the continual clamor and din, the familiar air of abstraction and the uninterested shake of the head in response to an inquiry are more or less to be expected, for stand attendants are much badgered with foolish questions in the course of the week, and become thoroughly accustomed to false alarms in the way of prospects. But during the earlier portions of the shows, there is no excuse for rendering anything but the best of treatment to intelligent and courteous visitors, and any breach of courtesy or lack of information on the part of the exhibitor may be regarded justly as an affront, for as a practical man the attendant must be willing ever to exploit his wares to the full and on the slightest and most frequently repeated provocation.

Of the ignorant attendant, this much is to be said, that he frequently performs to the best of his ability. Yet that is not always all that is required. Frequently the man who knows too little, tells too much, and when after hesitating about applying to certain busy heads for particulars about the product he applies to the ever-present and wise "factory expert" for information—and gets it—he is unable to distinguish between what is good fuel for the show fire, and what should be held in reserve or not used at all. Furthermore, his ignorance often leads him into misstatements and inaccuracies which, however slight, are more provoking and more harmful than his absolute ignorance would be. Usually he is useful because he is handy to pick for a few days, a glib talker, maybe something of a salesman, and last, but not least, is cheap. Yet it is questionable, all things considered, really how cheap he is sometimes.

Of the real expert who is absorbed with the affairs of sociability and business deals, so much so that he cannot spare time to talk to a stranger without an appointment, and who frequently neglects to fulfil such engagements when made, perhaps there is less to be said. As a rule they are their own masters to a degree and if they err, in this respect, it is an error in judgment or zeal rather than in knowledge. Yet were it understood among the individual exhibitors that during the entire working period of the show their forces were to be divided into relays; the workers do nothing but work, and the relays to keep away from the exhibits—there might be less cause of complaint. It is the tendency to mix too many kinds of business that renders the show at times unprofitable to the visitor.

Unfortunately the shows of the past have partaken of the three qualities of grand spectacle for the general public, exposition for the wholesale and retail buyer, and general trade exchange or mart. The three qualities so mingled do not conduct to an atmosphere which is over beneficial to either one. Were the manufacturers exhibiting to take this condition seriously into account in arranging their plans, however, it might be possible to secure better results all around, to contrive to find more time for the many little business details which require attention, and to afford the visitor a better opportunity of gaining the knowledge he requires in the briefest, most cogent manner.

Now that the American Automobile Association has abandoned automobile contests on horse race tracks, it would be interesting to know what is to be the standing of the course which had formerly held that status, but which is banked at the turns with cement or otherwise for the purpose of one or two specific automobile meets. Also it would be interesting to know what action if any, is to be expected in regard to the standing of contestants participating in races held on these courses, whether altered for the purpose or not.

COOPERATION IN BODY BUILDING

Automobile Builders and the Body Makers Working to Reduce Weight—Problems of Materials and Construction.

Of the vital subject of body design in its relation to vehicle development, altogether too little has been said in the past, and the attitude of the makers in general has been one of perhaps too much independence from the craft of carriage builders, who, alone have the experience and traditions necessary to evolve the proper combination of structural durability with harmony of line and convenience of accommodation. In this connection important work is being done by the Association of Licensed Automobile Manufacturers through its mechanical branch, in seeking the co-operation of the carriage builders' associations with a view to improving the breed of automobile body. Coker F. Clarkson, secretary of the branch, tells something of the progress which has been made in this direction, in a recent interview.

"One of the most important branches of the complex automobile industry is undoubtedly that connected with the body," he remarks. "When the first gasolene machines made their appearance, the questions of comfort, appearance and durability in body work were relatively neglected. There were a few American carriage builders with sufficient foresight to perceive the trend of events, banish their prejudices and meet the demand of the automobile manufacturer and user more than half way.

"Wood still plays an important part in high-class automobile body work. And if satisfaction is to be given, it is essential to employ none but carefully selected and thoroughly dried pieces. All the wood is many years old. It is stocked in buildings, ventilated by a special system, and packed layer on layer with joists between, in order that the drying process can continue evenly. The entire stock is examined every year and turned. At least five years elapse from the entry of a piece of wood into the factory, before it is cut up for use.

"There is nothing mysterious in good coach work, although it is surprising to find the great number of parts required to build up a limousine or landaulet, the strength of the iron work and the tremendous number of coats of paint. The paint on a large limousine body weighs much more than the average man would say; as much as 75 pounds and more. The painting and trimming of the car is in material degree specialized work. Good painting cannot be done on other than a good foundation, with the proper graduation of the several coats of paint and varnish.

"The strains to which a motor car body is subjected are greater than and considerably different from those in the case of a horse-drawn vehicle. No one engaged in making cabinets, furniture, house or other stationary fittings, could have any knowledge derived from the practice of his own business of what is necessary for the automobile. The framing of the timber, the use of panels, not merely as enclosures, but as trusses supporting the external framing, the hanging of the doors and provision for the clearance for paint, etc., have to be studied specially. The supposition that springs can give ease of riding when comparatively little attention has been paid to the form or material of the body and its trimmings is responsible for much discomfort.

"The Mechanical Branch of the Association of Licensed Automobile Manufacturers has held meetings with representative carriage makers, to see whether the latter can reduce the weight of bodies to any extent, and to interchange ideas on other interesting subjects on which the automobile engineer and the body maker are working. The Carriage Builders National Association was founded 35 years ago, and over 25 years ago established a technical school in New York for the instruction of carriage draftsmen. The idea of this school is to turn out men who can take a draft and work from it; or go back to the bench as workmen, their wages being increased by their technical knowledge; or later on, perhaps, secure employment as draftsmen distinctively. You can take two men and put them side by side in construction; let one man know his business, understand just how the thing should be proportioned; he will turn out a body that will be stronger and better than the man at the next bench; and there will be 100 to 150 pounds less weight in the product of the good man.

"One serious thing that the automobile and the body maker have been up against is the man wants to have a body built that will carry one person with the springs riding easily, in which he can pile eight or ten people and have the springs ride just as easily; which is somewhat like making a linen duster and a fur coat out of the same cloth.

"The makers of wood automobile bodies will not acknowledge that bodies made of aluminum are lighter than those made of wood; but maintain that the real state of facts is the reverse. By the use of templets practically, some excellent bodies are now being turned out with very great rapidity.

"The question of metal panels on bodies has another feature besides weight. One of the things that has troubled the carriage manufacturer is cracks and splits in the panels; which aluminum or sheet metal construction eliminates. The extreme heat and cold of a country are factors to be considered. A body built for example, in England, France, Germany or Austria, which have moist climates, different from ours, may last there for years, and give trouble here, in steam-heated garages, etc., by what is called 'opening up.' This is one reason why it is customary to kilndry lumber here, whereas abroad anything but air-dried lumber is rare or unknown. Moreover, the kind of wood generally used in this country has a lower coefficient of contraction and expension, besides being somewhat stiffer.

"Some body makers use aluminum coated steel for panels, to avoid checking in painting and what is known among painters as 'graining out.'

"As a rule automobile bodies are lighter than a corresponding body on a horse-drawn vehicle; for example, the rocker plate and sills of an ordinary landau, which weigh 160 pounds, are eliminated in an automobile body.

"The American carriage builders are now thoroughly aware of the changing character of their trade and welcome the automobile. They appreciate keenly the business of the automobile factories and are willing to work with them in every way. The members of the Licensed Association are pioneers in this co-operative work as in many others. When the automobile started, the average carriage maker pooh-poohed it and would not take hold. In Europe no automobile maker has ever built a body, probably, except one German firm who built a low-priced body."

COMING EVENTS

December 31-January 7, New York City—American Motor Car Manufacturers' Association's annual show in Grand Central Palace.

January 1, 1909, Los Angeles, Cal.—Automobile Dealers Association's 24 hours race, Ascot Park.

January 1-2—Quaker City Motor Club's two days endurance run, Philadelphia to Wilkes-Barre, Pa., and return.

January 16-23, New York City—Association of Licensed Automobile Manufacturers' annual show, Madison Square Garden.

January 21-31, Los Angeles, Cal.—Automobile Dealers Association's show.

January 27-February 3, Philadelphia, Pa.—Automobile Trade Association's eighth annual show, Second Regiment armory.

February 6-15. Chicago. Ill.—National Association of Automobile Manufacturers' Show, Coliseum. and First Regiment Armory.

February 15, Detroit, Mich.—Detroit Automobile Dealers Association's show, Wayne Pavilion.

February 15-20, St. Louis, Mo.—Automobile Manufacturers and Dealers Association's annual show.

March 6-13, Boston, Mass.—Boston Automobile Dealers Association's (Inc.) seventh annual show, Mechanics Building.

ROMAN ARENA FOR GARDEN SHOW

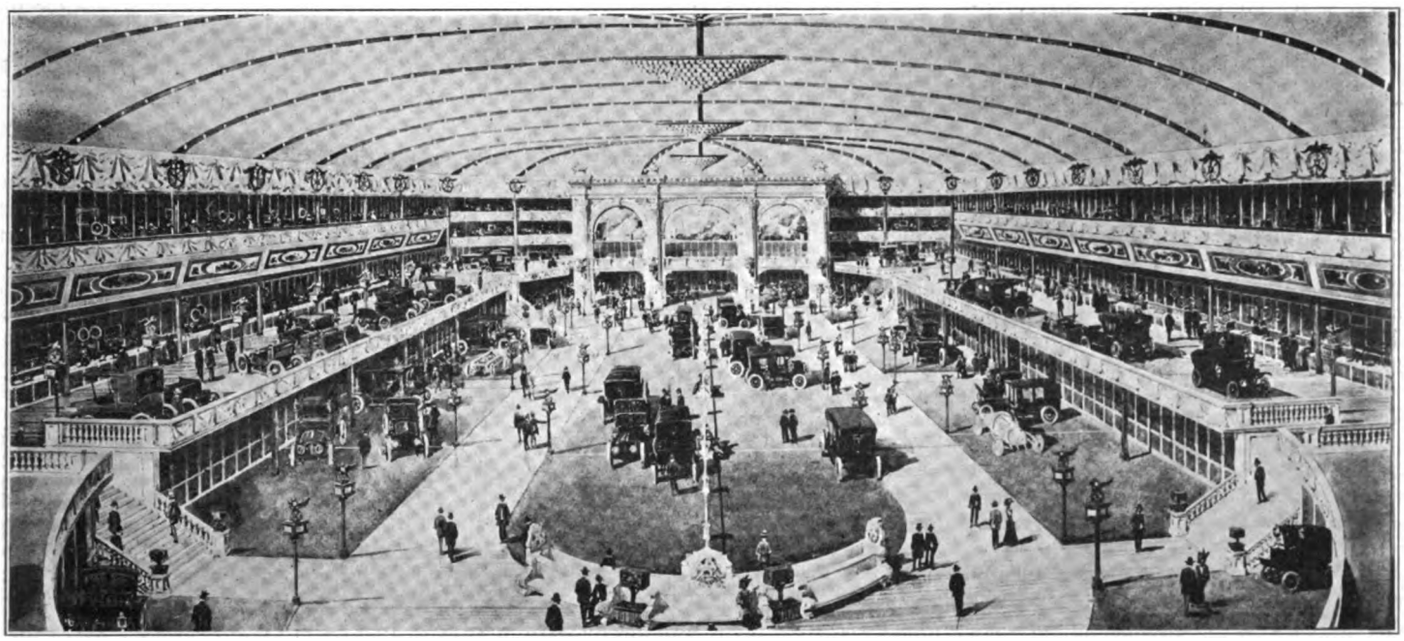
Complete Details of Decorative Scheme Suggest Colossal Effects—Italian Landscapes for Departments.

On the fanciful analogy that the Madison Square Garden is to New York City what the Circus Maximus was to ancient Rome, the efforts at embellishing that time-honored structure for the purpose of the "Ninth National" show which is to open under the auspices of the Association of Licensed Automobile Manufacturers on January 16th, will be carried out with a view to creating and fostering in every possible way the effect of the arena. An arena the Garden is and always has been. But for the forthcoming show the effect will be heightened by the subordination of all decorative items to this one ideal.

Complete details as to the general scheme of decoration have not before appeared. Prominent among them will be a new emblem which has been selected for the purpose and which is regarded by its originators as peculiarly apt and symbolic of the association's spirit. The new device is to emblazon the stationary and other emanations from the association's offices and will be one of the conspicuous features of the decorations at the Madison Square Garden show. The eagle with outspread wings, as shown in the illustration, suggests the purely American character both of the show and the association. The design places the triumphant eagle on an automobile wheel, between the spokes of which appear the association's initials, "A. L. A. M.," and, as used in the show decorations, the figures "09."

As for the elements of the color scheme, the main floor will reveal a blending of brown and white and green, under a sky tone of azure blue.

The floor will be carpeted with green, where the exhibition spaces are, and bare boards will serve for aisles. In a row down the center and at all the spaces of the sides will be white lamp-posts bearing the names of the exhibitors. Between the central row of posts will be tufted seats. Opposite the Madison avenue entrance will be a low electric fountain of gray stone, sweeping in a curve about the foremost exhibits of the central space, the convex side being toward the entrance.



The walls at the sides of the main floor will be laid out in panels finished with buff burlap. The face of the elevated platform above these brown panels will be festooned with white bunting, and the railings, which slightly overhang the main floor will be white. At the Fourth avenue end of the main floor will be the masterpiece of the whole plan, the big triumphal arch, 87 feet across and 48 feet in height.

The elevated platform will be supported from the main floor by white Doric pillars and also the steps leading to the platform will be white. The walls back of the platform will be finished in panels of brown burlap, and in the beveled soffit, between the walls and the facing of the gallery, will be oval panels containing frescoes depicting the history of vehicular progress. Above the panels will be the face of the gallery draped in white bunting.

The different departments of the show in various parts of the Garden will have a wholly new treatment. A latticed arbor will hood the concert hall with an arch 42 feet in span and 28 feet in height. This arbor will have vines and lanterns hanging from it and the room will be lighted through it. The walls will be finished in the natural burlap, thus preserving the color scheme of the main floor. The barreled vault of the arbor will be supported by latticed columns and the tympanum at the end of it will be in three sections, each draped with vines and bearing the show emblem.

In the cafe, just off the foyer of the Madison avenue entrance, where are to be the electric vehicles, the exhibits will appear beneath an Italian pergola presenting the impression of looking over a stone wall upon an Italian landscape. The weathered gray beams of the pergola will be supported by gray stone columns and from the beams will hang vines and bunches of electrically illuminated grapes. The sky will appear beneath the edges of the pergola, then the landscape between the sky and the wall that runs about the sides.

In the basement, the white and brown color scheme will be maintained, while the rathskellar, which has been a feature for two years, will be made to represent a stone wine cellar, with a groined ceiling and genuine half-casks set on platforms.

NEW RULES FOR BRIARCLIFF RACE

Original Limitations Provoke a Howl of Protest—Donor of Trophy Now Asked to Modify Deed of Gift.

Difficulties multiply in connection with the adoption of rules for the proposed Briarcliff road race next spring. On Wednesday, December 16, the Automobile Manufacturers' Committee, who are the promoters of the contest, adopted a set of rules which provoked such a howl of disapproval from certain of the manufacturers and dealers who claimed to have been slighted, that on Monday, the 21st., another meeting was called at which all of the original rules relating to cylinder bore and weight were thrown out and a new set adopted.

The limitations first decided upon restricted the bore to 5¼ inches maximum for four cylinder motors, or an equivalent for a different number of cylinders, with no limit on the stroke, and the minimum weight was to be 2,600 pounds. This limit permitted of a larger bore than that adopted by the foreign Association of Recognized Automobile Clubs, which is 5⅛ inches. Inasmuch as Briarcliff is intended to be an international race, it was feared that the Automobile Club of America, of which a sanction will be requested, would refuse to grant one, on account of the rules laid down by the Briarcliff promoters.

At the second session it was finally agreed to make the limitations as follows: Maximum bore of 4 cylinder motor, 4⅝ inches; maximum stroke 6 inches; minimum wheel base 118 inches; minimum weight 2,300 pounds. Equivalents of these dimensions will rule in cars with a greater or less number of cylinders. In connection with the adoption of these rules, however, the donor of the trophy, Walter W. Law, will be asked to change the deed of gift, so as to eliminate the clause: "the manufacturers of a car entered in the race shall have sold and delivered, or have built and have had ready for delivery, at least 30 days before the date of the contest in the year 1909 at least ten cars similar in each and every respect to the car offered for entry."

The request for this change will be made in view of the fact that the limitations as now agreed upon, will admit only machines of "stock car" dimensions, which, of course, will leave ample room for the discussion of the old question, "What is a stock car?"

Mardi Gras Meet for New Orleans.

The fact that the American Automobile Association has condemned motor racing on small tracks does not seem to worry the New Orleans Automobile Club in the least and that club has cheerfully announced that it expects to hold a three days race meet during the Mardi Gras carnival, February 20-22, 1909. This New Orleans organization recently affiliated with the A. A. A., and the secretary of the club, Homer George, learned not so long ago that money could be made out of automobile race meets. It was at his incentive that the recent hippodrome meet was held in that city at which Lewis Strang's troupe of performers managed to make the people think they were holding a real race.

A number of short events ranging from 1 to 50 miles, are scheduled for the three days. Beginning Saturday night, February 20, there will be a 24 hours race for stock chassis. The track, which measures one mile in circumference, is to be scraped, banked and oiled with dust preventative. Fred J. Wagner has been selected as official started.

Carris Winner of Worcester Run.

Final results of the Worcester (Mass.) Automobile Club's 210 miles reliability run through the snow, held on December 12, as announced by the technical committee, showed that after the most minute examination, only one of the 14 contestants who started on the run, received a perfect score. After submitting the Franklin car driven by C. S. Carris, to seven different examinations, it was found that the car had no visible defect for which it could be penalized. In the final scrutiny penalties were imposed upon cars for such trivial things as a screw loose in a floor plate, a loose dash bolt, engine pan bolt missing, or loose steering wheel.

Two almost-winners were Murch's Cadillac, and B. A. Robinson's Rambler, both of which received the scant penalizations of 2 points each, for loosened parts that almost required microscopes to locate. Eight of the original fourteen starters checked in at the close of the run with apparently perfect scores.

Philadelphia Offers Wilkes-Barre a Cup.

In connection with the Quaker City Motor Club's endurance run to Wilkes-Barre, Pa., and return on January 1-2, the Philadelphia club has offered a silver cup worth $300 as a prize for the Wilkes-Barre car making the best showing. Upon hearing of this offer a number of Wilkes-Barre motorists at once announced that they would enter the competition. The plan for these entries, as now laid out, is for them to start from Wilkes-Barre on December 31 and run to Philadelphia over the regular scheduled route, this trip to be the first leg of the contest. On the following morning, they will join the Q. C. M. C. members on the run to Wilkes-Barre, thus completing a round trip at the time the Philadelphia contestants finish their first half. This arrangement, of course, is to avoid the necessity of entrants from the smaller city shipping or driving their cars the extra double distance in order to compete.

LATE DECISION DISQUALIFIES LYTLE

His Isotta Car Loses Second Place in Record of Vanderbilt Cup Race—Its Excess Weight the Reason.

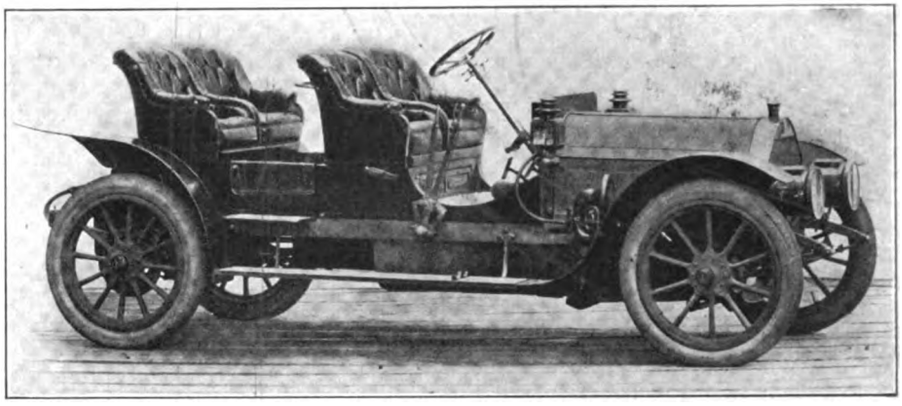
Summary announcement was made last week that the Isotta car which Herbert Lytle drove into second place in the Vanderbilt cup race on October 24 last, had been disqualified. The Vanderbilt Cup Commission, after allowing the Italian manufacturer the full benefit of several weeks' publicity, suddenly foreclosed on a technical violation of the rules, which were quite fully known and discussed at the time of the race.

It seems that when Lytle weighed in his car the day before the race, he was obliged to remove the mud-guard supports and a heavy tire rack, in order to get the weight trimmed down to the maximum allowance of 2,644 pounds. When the race started, however, the rack had been replaced, and upon weighing at the close of the contest, the technical committee found the machine above the weight limit. Wm. K. Vanderbilt, Jr., in order to make every possible allowance, gave instructions to have its tanks completely drained, all the mud and grease collected from the road scraped off and even permitted grease in the grease cups to be removed. In spite of all this effort to give the car the advantage of its participation in the race, it was found that the car was still 23½ pounds over the weight permitted by the rules.

Chairman Thompson, after duly considering the matter reported to Referee Vanderbilt that according to the rules, he was bound to disqualify the car and a meeting of the Cup Commission was called to discuss the question, before making it public. It was found impossible to get a quorum and the Chairman then notified the members of the commission regarding the decision.

While this decision positively disqualifies and eliminates the Isotta, it does not officially give second place to Florida in the Locomobile, who was third at the grandstand, after the race was declared off, nor does it affect the status of Luttgen, who finished immediately afterward with Vanderbilt's own car. The official records will now show that only one car actually finished the contest.

Denver Climbfest Indefinitely Postponed.



On account of local weather conditions, the Denver (Col.) Motor Club's hill climb, which was scheduled to take place on the Chimney Gulch road to the summit of Lookout Mountain, on December 12, did not come off and the contest has been postponed indefinitely. The canon is filled with snow and the roads are in a practically impassable condition.

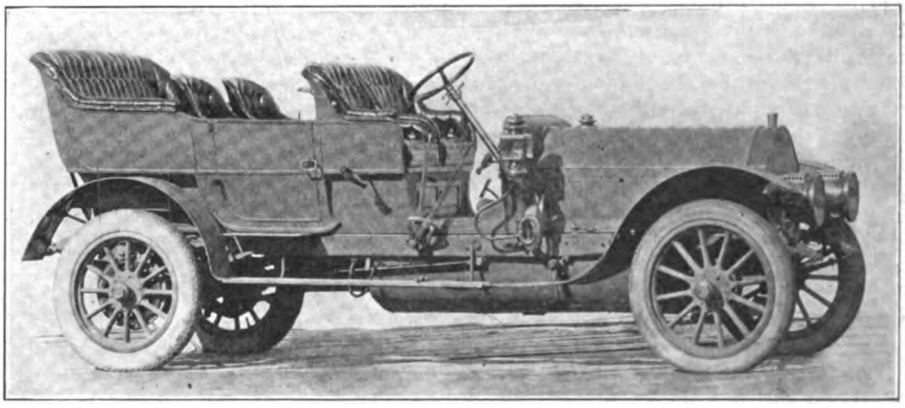
PIERCE MODELS SHOW DEPARTURES

Great Arrow Line for 1909 Includes Five Sizes and Many Styles—The Important Changes Specified.

Great Arrows—that is to say the Pierce family—will be known during the coming year in no less than five different sizes and styles, with the usual number of body variations to increase the virtual number of types by several degrees. Of six-cylinder models there will be three, the 60 model already so well known being continued, while two other and entirely new sextuple models also have been designed, one of 48 and the other of 36 horsepower, as measured by the A. L. A. M. rating. One of the two quadruple models which complete the line is practically a duplication of the 40 horsepower machine already in service with sundry minor improvements added to bring it more nearly up to date, while

PIERCE 6-36 FOUR PASSENGER TOURING CAR

PIERCE 6-36 FIVE PASSENGER TOURING CAR

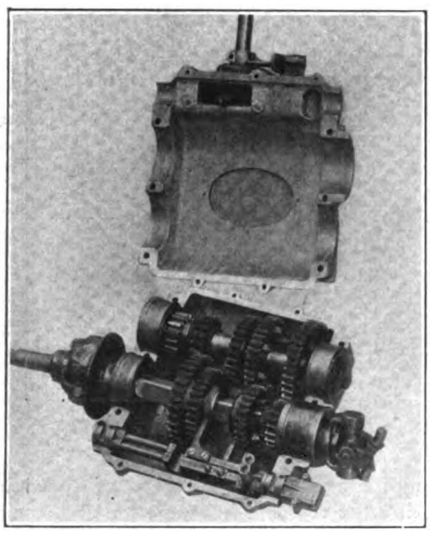


the other is rated at 24 horsepower, is entirely new, and is destined chiefly to fulfil the purposes of the ubiquitous town car.

The completion of these five machines reveals a number of deviations from previous practice in the efforts of the Geo. N. Pierce Co., most noticeable among them being the elimination of the former gear changing lever which so long has been carried in a convenient position directly under the steering wheel. Another important change, applying to the new four and six cylinder models, is the elimination of the former individual arrangement of cylinder casting and its replacement by the twin method. This in addition to other advantages permits the interjection of a liberal crank shaft bearing between each pair of cylinders and affords ample total bearing area for the shaft without sacrificing anything in the way of overall engine dimensions. Other changes also made, comprise the use of rollers for the valve lifter cam contacts, the use of sound deadening washers; the use of bronze-fiber timing gears in place of the solid bronze gears formerly employed, and the redesign of intake and water return pipes.

Second in importance, and accompanying the changed method of actuating the gear set, is the adoption of a new form of selective change speed gear, which is applicable to all the models. In addition to furnishing the conventional four forward speeds, with direct connection on the high, it is noteworthy in several respects. Its position is such as to permit the gear actuating rocker shaft to enter the box directly at one side, thus doing away with all secondary shafts and interconnecting linkages, and also considerably reducing the size of the gearset. In addition to this it is very compactly designed, so that despite its accomplishment of the manifold function of affording five changes of speed including the reverse, it is smaller than many three-speed sets and goes into the frame very handily just back of the clutch and well forward under the flooring in front of the driver's seat.

It has but two sliding sets, the first affording the direct connection through the main driving shaft by means of a jaw clutch, and the third, through the lay shaft which is in constant rotation. The second set gives the two lower forward speeds in the usual way, and the reverse by inter-meshing with an idler which is in constant motion. A somewhat unusual feature of the arrangement is that the neutral point lies between the first and second forward speeds, so that for manipulating in narrow quarters — which is the condition under which the reverse is most employed, the low forward and backward speeds are engaged by direct movement of the lever and without the necessity of passing through any idle or neutral point.



In this same connection a very neat form of clutch interlocker is provided in the shape of a circular arc-shaped plate which is positively attached to the gear shifting rocker and is perforated at a number of

PIERCE 6-60

Digitized by Google

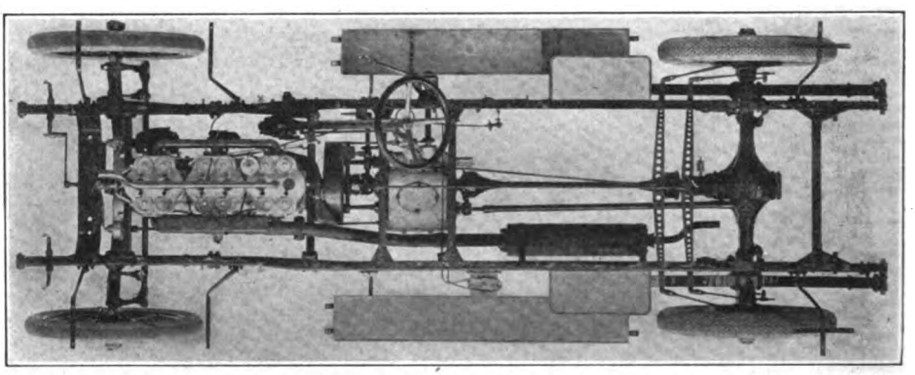
points to permit the engagement of a pin connected with the clutch mechanism. When the clutch is engaged, the pin enters one of these holes, thus locking the gear-

PIERCE TRANSMISSION

set against inadvertent handling or jarring out of mesh, while so soon as the clutch is unseated, the gear mechanism is free to move in any way desired under the influence of the shifting lever.

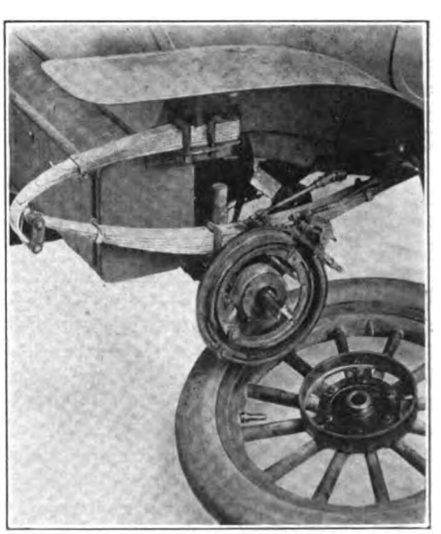
Power is transmitted to the gearset by a particularly neat and light form of cone clutch, leather faced and equipped with cork inserts set in a single row. The engaging spring is not only self contained and fully enclosed, but designed to take up an unusually small amount of longitudinal space, and is directly connected to the transmission shaft through a double universal joint. This compact construction, of course, permits the extreme forward position of the gear box, and also allows a rather considerable length of propeller shaft with consequent reduced augularity. Two double joints are provided in the propeller shaft, complete floating drive for the rear axle thus being secured.

The axle construction varies from the familiar "full floating" type in that the wheels instead of being mounted on the axle tubes are carried on the ends of the axle stubs themselves, the arrangement thus being of the semi-floating type. The parts, like the entire transmission group, are mounted on annular ball bearings, with adequate provision for lubrication. The outer ends of the stub axles are supported by bearings set close inside the wheels, while the inner ends are keyed into the differential gearing, the bearing suports being on the bronze hubs of the differential housing, rather than on the shafts themselves. The differentials are of the spur type, and the thrust of the driving bevels is absorbed by an independent ball bearing.



The triangular torsion rod, instead of being rigidly attached to the rear axle housing is hinged to it at two points, a vertical pin allowing a certain elasticity of movement for the axle. In this way the driving mechanism is given the complete floating arrangement without sacrificing anything to strength or rigidity in the lines of driving force.

Of the general details of the power plant, several of the special features are retained. The oiling system, for example is retained in its integrity, the oil being pumped from a well in the base through ducts in the crank shaft to the various bearings, the overflow being sprayed by the motion of the cranks, and serving to lubricate the cylinder walls. The carburetter is the same as has been used heretofore except for the construction of the auxiliary air inlet, which is somewhat out of the ordinary. It consists of a group of three spring-controlled reeds, which are equally spaced about the cylindrical walls of the air chamber. The reeds are backed by springs of varying tension and are opened progressively according to the varying demands of the engine as indicated by the suction, to admit just the required amount of diluent to the mixing chamber. Two sets of ignition arrangement are fitted, the principle standby being the Bosch magneto, which fires a set of plugs mounted horizontally in the sides of the valve chambers. The auxiliary system comprises dry batteries, coil and roller commutator, driven from a vertical shaft actuated by the inlet cam shaft. The plugs for this secondary system are mounted in the cylinder heads, adjacent to the valves. The latter, by the way, are still of the interchangeable type, and have been increased ¼ inch in diameter over the sizes in use on the 1909 models.



The spring suspension is of the semi-elliptical order on all except the new 6-36 and the smaller four-cylinder town car models. For these, the rear ends of the chassis are hung on three-quarter elliptics. An important detail of the spring construction is that instead of drilling the leaves to admit binding bolts, two bosses are stamped out of the successive laminations of such size that they fit and interlock tightly together, the saddles clamping them firmly together. For both front and rear members a swivelled bearing is secured on the axles, with a special form of saddle provided with a liberal oil way which is fed from grease cups which also are provided in every case.

The general specifications are: For the 6-36 model, 119 inches wheel base; tires, 36 by 3½ by 4 inches as a runabout, and 34 by 4 by 4½ inches when used as a touring car for two, three, four or five passengers; for the 6-48 model, 130 inches wheel base; tires, 36 by 4 by 4½ inches when used as a touring car for two, three or four passengers, and 4 by 5 inches when the seven passenger accommodation is employed; for the 6-60, 135 inches wheel base; tires, 36 by 4½ by 5½ inches; for the 4-40, 134 inches wheel base; tires 36 by 4 by 4½ or 5 inches, according to the type of body employed; for the small four-cylinder car, 111½ inches wheel base; tires 34 by 3½ by 4 inches, or 32 by 4 by 4½ inches as an option.

The special method of body construction which has been in successful use heretofore on Pierce cars is continued. The bodies are built of cast aluminum, the several sections being separately draw-filed and fastened together after the preliminary finish on a wood mounting, with lapped, riveted joints. After the joints are complete they are finished over by draw-filing, and the final finish built up directly on the metal.

THE NEW MARMON "THIRTY-TWO"

Features of Its Original Rear Axle Construction—Body Mounting Includes Three Distinct Types.

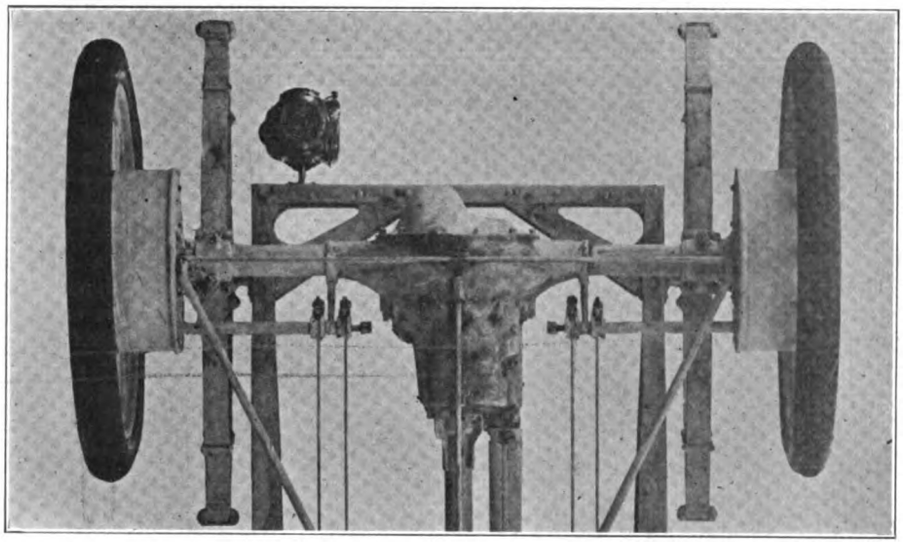
Complete details of the new Marmon "Thirty-two," the smaller of the two most recent additions to the product of the Nordyke & Marmon Co., Indianapolis, Ind., add not a little to the interest which its preliminary details, published some time since, served to create. The machine is a low, rakish, "Continental" appearing model, of pleasing lines and roomy and comfortable setup, besides which it is dignified by a number of mechanical features which are well worthy of special attention.

CHASSIS PLAN OF MARMON "32"

Its motor is the newest Marmon model of 4½ inches "square" dimensions and a nominal output of 32-40 horsepower according to speed and load. It is of original design throughout and while comparatively light in weight has been worked out with special regard to the two objects of great durability coupled with extreme accessibility. Particularly noteworthy in this connection are the use of very long pistons and connecting rods—both features conducive to long life and efficient performance. The motor is mounted by means of a three-point support within the main frame, the forward end being carried on a trunion which rests on the cross channel member, and the rear end by a steel tube the ends of which are cradled on the sides of the main frame. The crank case, which is of the barrel type, is a staunch, single-piece aluminum casting having an independent oil reservoir bolted to the bottom by means of through bolts instead of studs, which are secured by lock nuts, with lock washers and cotter pins. The crank shaft is removable through the rear end of the case—the forward shaft bearing being a solid bushing, while the intermediate and rear end bearings are of the separable type. The valves, which are oppositely disposed, have an opening in the clear of 2 inches. The valve tappets are provided with screw and lock nut adjustment, and are equipped with steel contact rollers which ride upon the cams. The tappet guides have a large bearing surface, are enclosed by practical dust caps, and are retained by means of crows-feet clamps.

The magneto and water pump are mounted on the exhaust side, with the shaft extending through the pump casing. Double ignition is employed using the Bosch high tension magneto, single Bosch coil mounted on the dash, battery arranged to work through the coil and the distributor which forms an integral part of the magneto, and one set of spark plugs located over the intake valves. The effect secured is thus practically the same as that of the complete dual ignition, but the amount of apparatus involved is much reduced and simplified. The intake manifolds are cast integral with the cylinder units and water jacketed, thus reducing the liability of the gasolene condensing from the gas while running at low speeds, in addition to bringing about a very desirable simplification of the piping.

Motor lubrication is by means of the Marmon system which has been in successful use for several years and which involves the use of a gear driven pump which draws the oil through a fine screen and serves it to the three main crank shaft bearings through radial holes leading from the hollow bore of the shaft and registering with grooves in the bearings once in every revolution, and through which it is carried to the connecting rod "big ends." Uniform pressure is maintained throughout the system by means of an adjustable relief valve conveniently located, together with a gauge mounted on the dash board which indicates the pressure on the oil passing through the system. The pump is placed in a case located on the outside of the engine base and is driven from the intake cam shaft by spiral gears. Provision is made for removing the screen, and the well may be cleaned out by removing a plate underneath in the bottom of the mud pan.



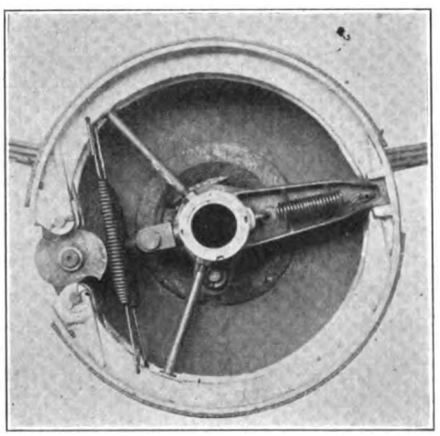
Transmission is through a plain cone clutch, leather faced and equipped with relieving springs. The clutch is engaged by a single spring and is mounted with ball thrust bearings to relieve the pressure of disengagement. The change gear is mounted on the rear axle—a new feature with this model, the rear axle construction being of particular interest in this connection. The axle proper is of identically the same construction as is employed in the larger Marmon "Fifty" car, except for the added details of the speed changing mechanism which it carries.

The axle housing is of pressed steel, the differential part being in the form of a ring with the tubular form continued through the wheel hubs giving a complete floating axle construction. Sleeves forming the support for the wheels, brakes and spring pads are secured to the ends of the axle tubes and these add stiffness and strength to the housing. The rear opening of the differential housing is closed with a cast aluminum cover which, when removed, permits the differential unit being taken out and also the transmission gear set without the necessity of jacking up the axle or disturbing it in any way, except the

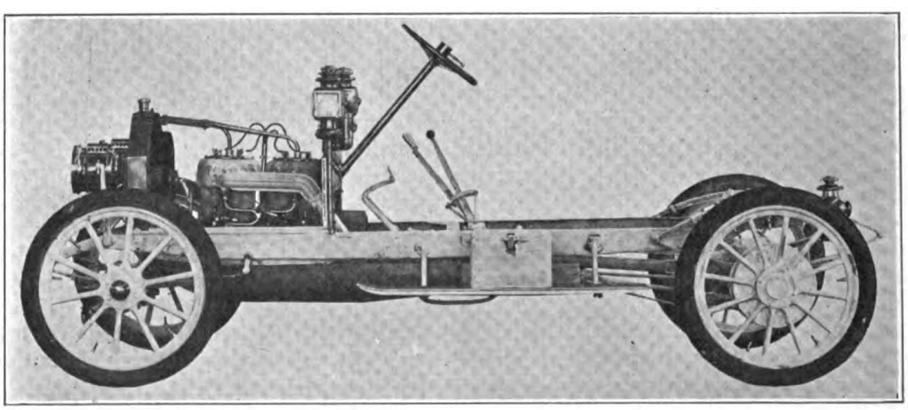
Digitized by Google

partial withdrawal of the floating axle drive shafts.

To the forward side of the axle housing is bolted the aluminum bell shaped gear box of the three speed selective transmission with the main shaft on top and the countershaft directly beneath.



MARMON REAR AXLE CONSTRUCTION



The radius rod and torsion group is here condensed into a single radius and torsion tube which encloses the propeller shaft and is yoked to the frame at its forward end by means of a huge ball and socket joint. The universal joint of the propeller shaft is mounted within this member, which, in turn, is suitably protected and enclosed to keep out offending dust and dirt. The containing aluminum housing also supports the gear shift rocker shaft and the emergency brake rocker shaft and is packed with lubricant—further, it is readily accessible through the floor of the car. The two gear shifting rods are enclosed in an oval tube which guards them from mud and water. Two pull and push braces from the ends of the axle to the forward end of the torsion tube, hold the axle firmly in position, while a truss rod fitted with an adjustable turn buckle passes underneath the gear box from the center of the axle to the forward end of the shaft tube, adding strength and rigidity to the structure.

Another peculiarity of the construction is the use of but a single row of balls in the mounting of the wheels, the alignment of those important members being secured by the inboard support of the stub axle ends in the differential casing. The result is at once a simplification of the mounting and the securing of a very short length of hub and an unusually neat wheel.

The brakes, which are of the internal expanding type, are placed side by side on the rear wheels, on a single drum 14 inches in diameter—the double sets affording an aggregate area of no less than 352 square inches. The shoes are faced with Thermoid lining and are mounted on a carrier the squared end of which fits into corresponding slots in the shoes, thereby giving a true floating ring construction. They are equalized and are applied by cam action.

ARMON BRAKES

SIDE VIEW OF MARMON "32" CHASSIS

The wheel base is 112 inches, and the wheels are shod with 34 by 4 inch tires. The spring suspension is by full elliptic members 40 inches long in the rear and semi-elliptic members, 35 inches long in front. The front springs are hung 15 inches from the front and 20 inches from the rear, thus allowing the radiator to be mounted even with the axle.

The body mounting is in three distinct types—the five passenger touring car; the four passenger 'suburban," which gives the general effect of the often yclept "baby tonneau," though with additional room; and the two passenger roadster, which has a very low seat placed well to the rear, special fenders, and a rear mounted fuel tank.

Relation of Braking Area to Weight.

Braking equipments having been reduced to terms of everyday security, it has now become a question of braking area in proportion to total car weight on wheels, instead of, as formerly, the mere size of the drums irrespective of the weight of the car. In this connection the H. H. Franklin Mfg. Co. has recently produced comparisons with the equipment of their seven-passenger touring car and a standard machine of another make. The weights of the two vehicles are, respectively, 2,650 and 3,400 pounds, and the Franklin car has an aggregate braking area amounting to 340.8 square inches. The area of working surface employed on the other machine is 339.2 square inches. But as is pointed out, in the latter case the brakes are all mounted on the rear wheels, whereas on the Franklin, transmission brake is so placed that it has three and one-half times the leverage of a rear wheel brake. This means an equivalent of 603.8 square inches rear braking area, which, as the other car has a disadvantage of 28 per cent. in weight, reduces its effective braking equipment by an amount sufficient to give the Franklin excess of 78 per cent.

New Palmer & Singer Model Coming.

As a result of the showing made by their car at the recent Savannah races, the Palmer & Singer Mfg. Co. has decided to produce a new Savannah model, only a limited number of which will be built, but which will follow closely the lines of the southern competitor for the Grand Prize. The car will be rated at 90 horsepower and will be sold under a 90-mile-an-hour guarantee.

BIG PLANT FOR SMALL APPLIANCES

Wonders of Laboratory Where Splitdorf Ignition Apparatus is Produced—The Firm's 50th Anniversary.

"It is a wonderful thing in its way. A few years ago to have dreamed of a big six story brick factory just making apparatus to deliver little blue sparks in the cylinders of gasolene motors would have seemed absurd," said an observing member of the trade, "but you can get a sidelight on the present size of the motor industry by taking a look at just that kind of a factory now, where magnetos, coils, spark plugs, switches, timers and such things are being manufactured and shipped in a volume that only a little time back would have supplied the world five times over."

He had in mind the Splitdorf Laboratory, in the Bronx, New York City. For anyone entertaining a curiosity as to what is inside of a high tension coil or how a magneto is made, it is a good place to visit. Even the man interested in the study of manufacturing problems in general will find food for thought, because the making of ignition apparatus on the large scale which the Splitdorf establishment has undertaken has evolved some rather pretty work in production methods and equipment.

To get to the new Splitdorf factory it is necessary to take the "West Farms" subway train, which after reaching the upper limits of Manhattan dives underneath the Harlem River, to come up in the Bronx on the other side. With a rush and a roar, together with a very uncomfortable compression of the atmosphere, the cars make their submarine dash, and, after a long uphill pull, reach the Mott avenue station, where the visitor alights. So deep has the plunge of the train been, however, that from the station platform it is necessary to take an elevator to the street level, which is four stories above. A short walk brings one to the factory, on Walton avenue near 137th street.

Upon entering the door, a strong smell of ozone and melting wax constitutes the first "impression" of the place. The smell goes with the business, just as there are peculiar odors associated with tanning, surgery, blacksmithing, brewing or the manufacture of perfumes. No difficulty is encountered in figuring out the source of the smell of insulating wax, but the ozone is harder to trace. The trip through the factory, however, discloses the mystery. The ozone is the product of the thousands of sharp electrical sparks which occur in the building during the course of the day in the testing of plugs, coils and magnetos.

Before passing to the department of purely electrical work, it is worth while to take a look at the equipment for the making the mechanical parts of the different Splitdorf devices. As in most establishments manufacturing comparatively small articles, there are numerous rows of drill presses, lathes, milling machines, grinders, and the like, but many of these are built in special forms to suit peculiar requirements. To make the ball races for the bearings of the magneto shafts, for instance, one of the mechanical geniuses of the factory has devised a set of special grinders which have the revolving spindles mounted in big double taper plain bearings, permitting an astonishing speed without either looseness or overheating. The bearings of the grinders look big enough to carry the shaft of a harbor tug, while the grinding tool is only about the size of a shoe button, but the speed at which the spindle revolves and the accuracy with which the ball races for the magnetos must be ground, require special precautions. In result, the grinders turn out magneto bearings which allow perfectly free revolution but not a trace of discoverable end-play.

That sharp-edged, "grained metal" finish which is a feature of all the exterior brass or bronze parts of Splitdorf devices, is secured by means of a rotary emery belt. The latter has an outer surface of emery cloth, and runs like a band saw over two rollers. The parts to be finished are pressed by hand against the belt as it flows from one roller to the other, and a moment's contact "grains" and polishes the metal. The pieces are then heated in a Bunson flame and subsequently lacquered so that they will preserve their bright appearance.

Nearly all of the hard rubber parts used are received cast from dies, so that they run uniform and perfect. Before the dies were made, each part passed through several earlier forms, each of which was improved after service had shown where better design could be effected. The dies are very expensive, and not until finality of design for a particular piece has been attained, can it be given over to the die method. Similarly in every detail of the mechanical work on the product, advantage has been taken of whatever methods will produce the required high standard of results in the most efficient way.

To understand a magneto it is necessary for the visitor to know that an electrical current can be "generated" or caused to flow in a loop of wire when a portion of the loop is moved between the two poles or ends of a U-shaped magnet. A magneto is essentially a set of magnets with a group of revolvable loops of wire between the poles. When the shaft carrying the windings of wire is revolved, electrical currents are set up in the wire windings. These currents can be tapped or conducted from the magneto to other parts on a car, provided a path is given them by which they may return to the magneto again, whether it be by a wire or simply through the metal frame of the automobile itself.

On the floor chiefly devoted to the manufacture of the magnetos, there may be seen, in addition to the testing and assembling benches, several long tables bearing rows of U-shaped steel pieces. These are converted into magnets by the simple process of surrounding them with coils of wire through which a strong electric current is flowing. The coils are fixed permanently to the wall, and the steel pieces are magnetized one by one, through being inserted in the holes in the coils, provided for their reception. The man in charge puts a piece in, turns on the current, waits a few moments, then turns the current off and on a few times, gives a final "dose" of some duration, and the trick is done. The magnetized pieces are fitted with short steel bars to connect the two ends and close the "magnetic circuit" so that they will not lose strength before being mounted in the magnetos of which they will form a part, and are then arranged in rows on a receiving table. Before being used they are tested, each one being required to lift an iron weight of about 20 pounds or to suffer rejectment as unsuitable.

The testing stand for the complete magnetos, on the same floor, is fitted with all the necessary shafting and gear wheels to drive the machines at various speeds. Connected up with a coil, each magneto provides current for a group of four or six plugs, according to the service for which it will be required. The Splitdorf "system" of magneto ignition is different from most in that only one coil unit is used, instead of a separate unit for each cylinder of the motor, and that the magneto not only supplies the dashboard coil with the necessary primary or low tension current, but accomplishes the distribution of the high tension current from the coil to the various cylinders in their turn.

Keeping in mind that the primary or low tension current only goes from the magneto to the coil and return, and that the high tension or secondary current in effect is conducted only from the coil through a distributer to the spark plugs and back through the metal work of the car to the coil, the system can easily be understood. The novelty of the Splitdorf arrangement consists in incorporating the distributer for the high tension current in the available space in the upper part of the magneto instead of having it outside as a separate part of the system.

In the electrical sense there is no difference whether the magneto and the high tension current distributer are together or a mile apart, but as a mechanical combination for economizing space and simplifying the method of drive the arrangement of the two together is a happy idea. The coil gets its series of primary current impulses from the magneto and at each impluse delivers a corresponding discharge of high tension current to the distributer in the upper part of the magneto. The latter is geared to the main shaft of the magneto in the proper ratio to send the high tension current along through each of the four or

Digitized by Google

six heavily insulated leads in turn, so that it is delivered to the spark plug of each of the engine cylinders at the proper time.

For one coil unit to do all the work ordinarily accomplished by four or six obviously requires that it be made extremely durable and of a capacity to avoid overheating. Such is the construction, and a very generous sized trembler is used, much more substantial than on an ordinary coil. The coil is wired to take battery current as well as magneto. To start the car from the seat a mother-of-pearl push button is located in the side of the coil box. By pressing the button the primary circuit from the battery is closed, independent of the position of the timer. The resulting flow of high tension impulses is sent from the coil to the distributor and passed along to the correct cylinder, since the distributing arm is geared always to be in contact with the lead to the cylinder which is in the position to be fired.

Fifty years of experience in making coils has taught the Splitdorf people some things which lead them to make the inside of their coils quite different from many others. The usual ignition coil has a core of soft iron wires extending like a straight piece, which when magnetized by the flow of primary current around it has its poles at opposite ends of the coil. In watching the construction of the Splitdorf coils, however, it will be seen that the core also contains various lengths of very fine strands of wire, much longer than the coil itself is to be.

When the coil is ready to assemble these are not cut off flush on the ends as one would expect, but are looped around the outside of the wire windings toward each other until the longest ends almost touch to form a complete "magnetic circuit." The theory in this connection is rather intricate and has to do with taking care of various magnetic eddies and stray currents that would otherwise unfavorably influence the action of the coil. The winding of the wire around the central core differs from the more common method, too. The winding is in two sections, one for each the upper and lower halves, the sections being wound oppositely but with their terminal connections so disposed as to unite in the one effect.

Big sheets of shiney black hard rubber are used up rapidly in being cut into strips of suitable size for insulation inside the coils. To fold and bend them to the proper forms, the strips are heated for a moment over a sootless flame, when they become soft and pliable for the brief time necessary to shape them. Whatever care may be manifest as to the exterior perfection of the coils is more than matched by the painstaking work that is done on the interior assembly, where the materials used are of the best. The wiring leads inside are covered with small white rubber tubing and all the insulation made with a thoroughness suggesting that no work will be left for the wax insulating filling except to occupy the spare space in the containing box and make the contents one mass.

But it is the top floor that is the liveliest and most interesting for the visitor, not necessarily because of the fact that here a good proportion of the operatives are bright looking girls, but because of the diversity of operations which are going on. The big wax melting pots are on this floor, looking like dwarf ore smelters. The machine which winds tin foil and insulating paper together for the condensers, and the machine which crushes the rolls thus made into suitable shape for the coil boxes, are located here. The repair department and the wreckage department occupy another corner, looking very industrious by reason of the fact that in tearing down old coils it is necessary to make the wax chips fly when chopping the insulation away from the windings.

The tinkle of a telephone bell is heard intermittently in the hum of work. It does not signify real telephone calls, however. An old style telephone generator of the kind where you whirl the crank to ring the signal, is used in the repair department for the purpose of testing coil windings. The girl in charge of the work connects the two terminals of the suspected piece of wire winding to the terminals of the telephone magneto, and revolves the crank. If the bell tinkles the winding is good, but if the bell cannot be made to sound, the winding is thrown in the scrap heap.

Mica seems like hard stuff to handle, and yet in the spark plug department on this top floor the visitor can see something of a wonder performed with it is the result of a clever method of manipulation. The central metal core of the new combination mica and porcelain plug, which the department is devoting its chief attention to at present, is wound with white India mica. The core is tapered and the mica is rolled around it in short, curved, overlapping strips by means of a small hand-operated lathe device. Tightly as it can be wound by this method, however, it does not meet the Splitdorf requirements. The core with its wrapping is placed in the bushing of the plug, with the small end of the taper toward what will be the top of the plug. While the bushing is securely held, the large end of the core is hit a sharp and powerful blow, driving the tapered core with great force into the narrowing mica coating which surrounds it. The result is that the mica layers take a spiral relation to the core and grip it to the last possible degree.

The formation of the mica is then such that with a sharp knife all the loose edges may be scraped away until the blade comes to a hard, seemingly solid, glass-like surface that cannot be scraped down further. A close examination under a microscope reveals that the successive layers from a surface which appears like overlapping fish scales, but the similarity does not extend to any such easy disarrangement or removal as characterize the latter. This method of using the mica circumvents practically every objection which has in the past been offered against the material as a spark plug insulator, it is said. Mica washers are used on the plug only to surround the upper part of the central mica winding on the core, while over the washers there is a further protecting hood of green porcelain.

From the sixth floor down to the second, the building is filled with busy workers in the manufacturing end, presenting, as previously suggested, a striking corrallary of the magnitude of the motor industry requiring this among many other factories to supply its ignition needs. The ground floor contains the offices, the shipping room, a stock room and a place for automobiles requiring ignition installation or repairs at the factory. The basement has the woodworking department and also has the boiler room and power plant for generating electric current for the building. The room contains a very elaborate and complete switchboard, where mischievous hands sometimes turn out the lights to mystify the visitor.

New as the factory and equipment are, the Splitdorf Laboratory is one of the real veterans of the trade. It was founded at Philadelphia by Henry Splitdorf, in the year 1858, for the purpose of carrying on experiments connected with projected improvements in telegraph instruments. The great problem in those days was to cut down the length of time required to send a message between New York and Chicago. This, Henry Splitdorf set about to accomplish, and he succeeded in doing so by the invention of the repeating relay which reduced the time required for the transmission of a message from New York to Chicago to about five minutes, whereas the former time was between five and seven hours.

This work being accomplished and the Western Union Telegraph Co. requiring a great number of instruments, Henry Splitdorf began the manufacture of them and so continued for several years. Finally, the Roentgen rays having been discovered, he went into the manufacture of large sized Rhumkorff coils for the use of the medical profession and experimenters.

Out of this small beginning grew the present enormous busines, and during the year 1885 his son Charles took up the management of the business which Henry Splitdorf had relinquished on account of advancing year, and the firm drifted gradually into the manufacture of the Splitdorf coil for ignition purposes. Following this the younger son, John, was taken into the business in the year 1889, and the Laboratory at 17-25 Vandewater street, New York City, was then established. It continued at that location until 1907, when having greatly outgrown its quarters the entire Laboratory was removed to the new factory, 261-265 Walton, the Bronx, giving about 60,000 square feet of space.

FIRST OF THE NEW CROP OF LAWS

Massachusetts Getting Grist Ready for the Legislative Hopper—State Highway Commission Drafts a Bill.

Locking up the automobile that happens to upset the unwary wayfarer is the remedy some citizens of Massachusetts appear to be considering seriously as a means of checking the reckless or careless motorist. It was suggested at a meeting of the Twentieth Century Club in Boston last Saturday afternoon, while Robert Homans, attorney for the Safe Roads Association, was discussing the topic of adequate restriction for automobiles. Inflicting fines, he said, does not reach the owners of the machine in any adequate way.

"Why not put his machine in jail?" interrupted some one in the rear of the hall.

"That's exactly what I propose," was the reply. "Take the car and all the cars away from the reckless owner and he'll keep within the law after he's paid his penalty."

That the automobile laws of the State are not uniformly enforced was a view that was freely expressed by Mr. Homans and others, one of the reasons specified being that as roads now are built in Massachusetts they are constructed and kept in repair by local bodies and the laws governing their use are enforced by local police. The result is that there is no general control; but laws and ordinances and general conditions differ widely in various parts of the State.

Meanwhile, with the annual session of the "Great and General Court" near at hand there are the usual notes of preparation for amending the automobile law. The Massachusetts State highway commission has drafted and presented to Governor Guild for approval or revision, a new bill regulating the use of automobiles. This is one result of the conference of the highway commissioners of the New England States, which itself was a result of the conference of governors. The Massachusetts board was authorized to prepare a bill incorporating a number of approved suggestions, and the bill is to be urged on all the New England legislatures.

The commission has practically codified the laws on the subject in the New England States, and has adopted some ideas from States outside of this territory.

Some of the provisions are as follows:

A limit of 10 days for non-residents to operate automobiles in the State without registration, but with a new definition of "non-resident" which excludes from the class people who have a regular place of business or abode in the State for three months or more in the year; such persons have to pay registration fees, but get a half rate for the three months, July, August and September.

Numbers must be illuminated at night, but the Massachusetts requirement of numbered lamps has been eliminated.

An "adequate brake" specification is copied from the laws of New Jersey. A minimum limit of 16 years is fixed for private operators, and 18 for chauffeurs; all persons who receive compensation for work on automobiles are chauffeurs, must be licensed, and no person may employ an unlicensed chauffeur. "Dealers" include persons who let motor cars for hire, thus permitting them to take out "dealers' licenses."

New garage rules are incorporated in the bill, one being a requirement that motor cars shall be checked in and checked out of garages; this is so that an owner may know how often his car has been taken out and stop the unauthorized use of cars.

The proposed law imposes a speed limit of 25 miles, and allows judges to place on file complaints of speed above that limit if in his opinion it was unintentional or "that no person or property could have been injured thereby." A limit of eight miles an hour around curves and corners in also provided.

Registration fees are to be based on horse power; the uniform fee to be 50 cents per horsepower, graded in multiples of 10.

Morrell Sues the State Engineer.

That Briarcliff road race which was held last April, gave the promoters no end of trouble at the time and the trouble is not yet ended. It has just been made public that Robert Lee Morrell has instituted suit against State Engineer Frederick Skene, who at the eleventh hour, came very near preventing the race over the Westchester county course. The day before the contest was scheduled to take place, Skene demanded a cash deposit of $4,600 to cover any possible damage to the State roads used in the course. The Automobile Manufacturers' committee, in charge of the contest, offered to put up a bond for the amount, but Skene would accept nothing but cash. Morrell raised that amount and it was handed over to the State Engineer, under protest.

Subsequently, a portion of this amount was returned to the committee represented by Morrell, but it was only a very small portion—$582.14. The amusing feature of the suit is that Job Hedges, who represents Morrell and the committee, does not claim that the roads were damaged to any extent less than Skene declared, but contends that the State Engineer had no right to lay down his own rules to the Manufacturers' committee as to how the race should be run, and that he had no legal right to exact cash and collect it from the committee.

Engineer Skene declared last Saturday, that he was absolutely sure of his right to retain $4,000 of the amount deposited with him and that the suit was not causing him any worry whatever. The outcome of the case when it comes to trial will prove interesting to many.

ADMITS THAT THE LAW IS FAULTY

Commissioner Smith of New Jersey Replies to Protests—He Will Co-operate in Efforts for Fair Legislation.

Admitting that plans exist in New Jersey's law regulating automobiles, J. B. R. Smith, Commissioner of Motor Vehicles, replying to the protest of the Newark Board of Trade, and the alleged attitude of automobile interests outside of the State, against the law as it now stands, says in part:

"Perhaps no problem has so embarrassed all friends of good automobile laws as that attending the charge of a lack of comity between New Jersey and her sister States in the interchange of licenses, and we have all earnestly striven to find the correct solution.

"The department has given much study to this subject, and has had the hearty and loyal co-operation of the active representatives of the organized motorists.

"Some time ago I suggested the desirability of having a conference called at a convenient time, at which representatives of motorists from all the States interested in the subject, including those who make laws, as well as those who enforce laws, and all those whose interests are in any way affected by the use of motor vehicles on the highway, including farmers, tradesmen, manufacturers and tourists, might meet and in a proper spirit discuss the most efficient methods of automobile regulation. I am hopeful, indeed, expectant, that means may yet be provided whereby such a conference may be held.

"Of the ultimate outcome I have always been optimistic, and if I can be of any service in not only raising standards of legislation, but of actually securing a more efficient protection to the inalienable rights of all those who use highways, whether they be motorists, horsemen or pedestrians, I shall be more than repaid for the effort. This problem is capable of solution. New Jersey will solve it, and we are all working for that end."

One Way of Avoiding Fines.

One way to avoid speed fines is to follow the example of a chauffeur named Alexander Lee, a native of Norway, who, until recently worked in Detroit. Lee was employed by the Ford Motor Co. and made such brilliant progress in the speed line, that finally he was arrested for maintaining a clip of 30 miles an hour on the boulevard. Lee said he knew of a neat way to avoid paying a fine or serving a sentence for the offense and it was found to work very well, for when the case was called last week, it was learned that Lee, who had attained such high proficiency in the driving art, had returned to dear old Norway.

NOVA SCOTIA PLANS BETTER ROADS

Probable Effect Upon Automobiling in the Province—Poor Highways a Reason for Present Onerous Restrictions.

Motor cars have not been in much favor in Nova Scotia in the past, says Consul General David F. Wilber, of Halifax, in a report to the State Department at Washington. He gives as a reason the poor condition of the roads throughout the province, but there has been a decided effort to over come this defect, which is as much of a drawback to the driving of horses as it can be to the operators of automobiles. At the last session of the provincial legislature, he says, "a bill passed authorizing the establishment of a department of roads and appropriated for the improvement of roads $175,000, and also $25,000 for small bridges.

"There are 97 automobiles registered at the office of the provincial secretary," he continues, "divided as to origin as follows: United States States, 61; Canada, 32; England, 3; Scotland, 1. According to the population and wealth of Nova Scotia this is a poor showing, and is largely due to defective methods used in introducing this line of goods. The Canadian makes are built on the same lines as those made in the United States, most of them being manufactured by American firms having factories in Canada. The predominating style is the runabout and the lighter touring cars, from 8 to 30 horsepower.

"While improved roads will do much to increase the sale of motor vehicles, the last legislature passed another law which will have a tendency to interfere somewhat with the general use of automobiles in some localities. This law gave to each local government the right to regulate the running of automobiles in their respective jurisdictions. It was claimed while the bill was up for consideration that owing to the narrow roads so prevalent in Nova Scotia, it was dangerous for farmers with teams to meet automobiles, as the drivers of the latter disregarded the rights of the former, which has resulted in accidents. Of the 24 municipalities (districts), 34 towns, and 2 cities in the province, four municipalities and two towns have regulated the running of automobiles and prohibited them on the following days: Pictou—Sunday, Tuesday, Wednesday, Thursday and Saturday; Kings—Thursday, Saturday and Sunday; West Hants—Tuesday, Thursday, Saturday and Sunday; Yarmouth—Saturday; Town of New Glasgow—Sunday, Tuesday, Thursday and Saturday; Town of Pictou—Sunday, Tuesday, Wednesday, Thursday and Saturday.

"Medium and low priced cars are mostly in use, and there is no question but what a larger business could be done here if the market were properly looked after. The duty on automobiles from the United States is 35 per cent ad valorem; from Great Britain a duty of 22½ per cent. ad valorem is charged."

Chicago Eager for Stock Chassis Race.

Chicago is more anxious than ever to get the stock chassis race for the Jefferson De Mont Thompson trophy, next spring. The contest committee of the Chicago Automobile Club has laid out a new course 22 miles in length, that is declared by persons who ought to know, to be 50 per cent. better than the circuit over which the Briarcliff race was run last April—an opinion which would probably not be disputed by anyone familiar with the Westchester county course. President Cobe, of the C. A. C., wants Mr. Thompson to visit Chicago and personally inspect the proposed circuit in Indiana, which is macadam the entire distance. The club has had taken a number of photographs of the course to submit to the American Automobile Association, when it applies for a sanction to hold a stock car race.

Jackson Heads Grand Rapids Club.

At the annual meeting members of the Grand Rapids Automobile Club elected James R. Jackson, president for the ensuing year. Jackson has been identified with motoring for some time and at present is vice-president of the Michigan State Automobile Association. Other officers chosen were, first vice-president, Louis C. Parmenter; second vice-president, George J. Henzelman; secretary, Dr. Warnshuis, and treasurer, Dr. Willard Burleston. These officers and Dr. D. Emmet Welsh and A. A. Barber, will comprise the board of governors.

Los Angeles Dealers Plan a Show.

The last week in January has been selected for an automobile show in Los Angeles, Cal., to be run by Dick Ferris, on behalf of the Automobile Dealers Association of Southern California. The entire basement of a very large building at Broadway and Eighth street has been selected for the exhibition. So large is the space that a real automobile race in the show room is promised as an amusement feature to draw the public.

Manager Selected for St. Louis Show.

To manage the third annual automobile show to be held in St. Louis, Mo., February 15 to 20 inclusive, Lloyd Rickert, secretary of the American Baseball Association, has been selected. The exhibition will be given in the new Coliseum building, Jefferson and Washington avenues.

Memphis Show Scheduled for March.

Memphis, Tenn., is to have an automobile show, which will probably be held in the Auditorium building. The dates chosen are March 10 to 13, inclusive.

SEASONING JUSTICE WITH SENSE

Massachusetts Magistrate Says Skid Chains Can't Damage Ice Covered Roads—He Pigeonholes a Prosecution.

Judge Bruce, in the district court at Malden, Mass., on December 17, held the opinion that while it was a technical violation of the law to drive a car equipped with skid-chains or metal studded tires, a motorist should not be fined for piloting a car thus equipped if there is snow on the ground.

The local police arrested Howard A. Lothrop, Joseph L. Goodale and Matthew C. Brush, all of Boston, for driving over the Parkway through Malden and Medford with tire-chains attached. Judge Bruce immediately asked the park officers if the road was covered with snow or ice at the time the offenders drove through it and was told that it was. The court asked if there were any bare spots visible and the officers replied in the negative. With that, the judge decided to place the case on file and while he could not discharge the defendants or dismiss the case, on account of the violation, he held that roads could not be damaged by chains when there was thick snow on the ground and firmly believed that when roads are slippery, chains or studded bands are a necessity. He told the drivers, however, that they and all all other motorists using chains, would have to do so at their own risk, in event of encountering bare spots in the road, in which case they are liable to arrest and fine.

This unique decision highly pleased the owners, who expect to take the risk when more snow falls.

Toronto Provides for Foreign Exhibitors.

For the benefit of exhibitors from "foreign" countries, including the United States, the management of the third annual automobile show at Toronto, Ont., has arranged to make the exhibition building a bonded warehouse, where exhibitors' goods will be received duty free. The show, which will be given under the auspices of the Ontario Motor League, will take place in the St. Lawrence Arena, February 18 to 25. The manager is R. M. Jaffray, 1 Wellington, West, Toronto.

Portugal's Automobile Census Small.

Portugal at present boasts in all of 838 automobiles, according to a recent report, of which 501 are permanently located at Lisbon and 148 in Oporto. In an effort to stimulate the movement to renewed vigor, however, it is stated that the Royal Portuguese Automobile Club is endeavoring to secure a reduction in the import duties on cars, tires and component parts, and a simplification of the customs formalities requisite for admittance of the goods.

The Inter-State

The INTER-STATE Automobile is built for the intelligent purchaser who wants the high quality which heretofore has been found *only* in *high-priced* cars, but who does not want to pay from twenty-five hundred to five thousand dollars.

The INTER-STATE makes it unnecessary for such purchasers to pay such prices. It is a *permanent* car, embracing every essential factor of worth in automobile design, style, comfort, speed, endurance, dependable materials and workmanship. And it is sold at a price—$1750 complete, *including Eisemann Magneto*—but little higher than the "good-enough-until-later" cars.

There is no economy and most assuredly no automobile satisfaction in buying a car that you want to discard the second season for a *real* car. Especially since you can buy the *real* car, the *satisfying permanent* car *this* season for just a little more money than a temporary car.

In justice to your own best interests, let us urge you not to *think* of spending your money for a "cheap" car, or even a higher-priced good car, until you have seen the INTER-STATE. We are glad to let you be the sole judge as to its worth at $1750.

Dealers and Agents will appreciate the opportunities opened to them by the INTER-STATE. Write for our attractive proposition.

INTER-STATE AUTOMOBILE CO.

126 Willard Street **Muncie, Indiana**

At the Shows The full line of Inter-State automobiles, including Standard Touring Car, Demi-Tonneau, Double Rumble Roadster, Single Rumble Roadster and Tourabout, will be exhibited at Grand Central Palace, New York, December 31-January 7, and at the Coliseum, Chicago, February 6-13.

WARNING

NOTICE to MANUFACTURERS of EXPLOSION ENGINES used for any purpose

I am the owner of the Letters Patent of United States No. 617,806, granted to F. E. Canda, January 17, 1899, for electric Igniter for Explosion engines, and letters Patent No. 905,625 granted to Elmer Apperson, December 1st, 1908, for improvements in Explosion engines.

Briefly stated, these patents cover broadly the use of two or more separate electric igniting devices, provided with separate circuits and means of throwing the igniting devices into or out of action simultaneously or independently; as well as covering the use of two or more spark plugs or sparking points having electrical connection with a magneto and battery with means of throwing the spark plugs or points into or out of operation.

MOTOR ILLUSRATING APPERSON SYSTEM OF IGNITION UNDER PATENTS 617,806 AND 905,625.

All parties now using or desiring to use this system of ignition are invited to negotiate with me. I have no desire to unnecessarily embarrass any one, but INFRINGERS on my patents will be legally and vigorously prosecuted.

ELMER APPERSON.

Apperson Bros. Automobile Company, Kokomo, Ind.

The Week's Patents.

899,186. Internal Combustion Engine. William Rabsilber, New York, N. Y. Filed June 24, 1907. Serial No. 380,380.

1. The combination of a reservoir for comprssed air; a reservoir for fuel; an internal combustion engine connected with both said reservoirs; an air compressor connected with said reservoir for compressed air; means controlling the supply of compressed air and fuel from said reservoirs to said engine; and means for heating the entire contents of one of said reservoirs before admission to said engine, said reservoirs being separate and free from communication with each other.

899,216. Internal Combustion Engine. Thomas W. Hendry, San Francisco, Cal. Filed Nov. 6, 1906. Serial No. 342,247.

In an internal combustion engine, a cylinder having discharge ports, and an inlet port, a piston having a laterally extended straight wall passage arranged to communicate with the inlet port, the piston passage terminating in a short nozzle at the center of the piston head in the line of the axis of said piston, the wall of the said passage opposed to and distant from said port being provided with a curved pocket concaving or bulging away from said inlet port and providing for the impingement of the charge thereagainst and by which the force of the stream of incoming gas is broken and the stream is thence deflected through the nozzle in a straight line following the axis of the cylinder.

899,253. Vehicle Guiding Means. Leslie S. Hackney, St. Paul, Minn. Filed Aug. 9, 1907. Serial No. 387,771.

1. A vehicle track having an upper or tread surface to receive the vehicle or car wheels, a yoke mounted on the frame of the vehicle and having arms yieldingly held toward said track, wheels mounted on said arms and having flat treads adapted to rest and normally travel on the top of said track, said wheels having flanges on one side arranged to extend down beside the rails and contact with the inner faces thereof, whereby the vehicle wheels will be held on the track and said flanged wheels revolving in planes parallel substantially with the plane of the vehicle wheels, substantially as described.

899,331. Wheel for Vehicles. William H. Scrymgour, London, England. Filed Aug. 12, 1907. Serial No. 388,208.

In vehicle wheels a coiled, or spiral springy metal piece, secured at, or near, one end, to the hub, and at, or near the other end, to the interior of the outer part or rim, and metal springs to give resiliency, and strength in the space between the hub and the interior of the outer part, or rim, and bearing on the said coiled or spiral springy metal piece; substantially as herembefore described.

899,332. Spring Wheel for Vehicles. William H. Scrygour, London, England. Filed Sept. 30, 1907. Serial No. 395,191.

1. In a vehicle wheel comprising discs mounted free to rotate on an axle and bolted together, the combination therewith of blocks or shoes pivotally mounted in said discs near the periphery thereof, an elliptical spring fixedly carried by said axle to be engaged with by the wheels of said block on the minor axis of said spring to cause said blocks to have engagement with the road surface for a fractional space of time to support the load.

899,333. Vehicle Wheel. Isaiah C. Scudder, New York, N. Y. Filed Feb. 16, 1907. Serial No. 357,637.

1. In combination, a vehicle wheel having an outer metallic band, a detachable rim, oppositely disposed locking rings adapted for locking said rim to said metallic band, and means for simultaneously forcing said locking rings into place, said means including a plurality of radially movable U-shaped clamps.

899,425. Resilient Wheel. James E. McQuilkin, Westmoreland county, Pa. Filed Feb. 4, 1908. Serial No. 414,230.

1. In a wheel, the combination of a boxing formed in its periphery with a plurality of sockets, a hub encircling the boxing and spaced therefrom, an annular cushion interposed between the hub and the boxing, a tie band carried by the cushion and formed with inwardly disposed lugs seated in the respective sockets of the boxing to prevent the cushion from rotating relative thereto, and means for rigidly securing the cushion to the hub.

899,430. Means for Raising Vehicle land. Filed July 15, 1907. Serial No. 383,-Bodies. Arthur J. Pack, Brighton, Eng-738.

In a means for raising vehicle bodies, the combination of a chassis, a vehicle body hinged thereto, a jointed supporting leg pivoted to said chassis and said body, and adapted to be folded over upon itself when not in use, and a telescopic spring support pivoted to the chassis at one end, and to one of the members of the leg at the other end, one of the folded members of said leg being provided with means to prevent said members from striking against each other, substantially as described.

899,468. Spring Repairer. William R. Petze, Brooklyn, N. Y. Original application filed Feb. 16, 1907. Serial No. 357,715. Divided and this application filed Sept. 5, 1907. Serial No. 391,478.

1. A device for repairing semi-elliptic vehicle springs, consisting of a tie-piece shorter than said spring and having its major portion spaced away from said spring and having means near one of its ends for attachment to a vehicle, and means for fastening said tie-piece to said spring at one side of a break in the spring.

899,498. Starting Mechanism for Gas Engines. William K. Andrew, Milwaukee, Wis., assignor to International Harvester Company, a Corporation of New Jersey. Filed Nov. 26, 1906. Serial No. 345,245.

1. A starting mechanism for gas engines, including, in combination, a supplemental valve casing having an annular chamber therein communicating with a supply of compressed air and the engine cylinder, an inlet valve controlling the admission of air to said chamber and opening against the pressure of air from the source of supply, a supplemental exhaust port communicating with said chamber and the engine cylinder, a valve controlling said exhaust port and opening against the pressure of air in said chamber, said valves being opened by a moving part of the engine and closed by the pressure of air.

899,526. Transmission Mechanism. Adam F. Glaser, Jersey City, and John Olsen, Whippany, N. J., assignors of one-third to George W. Crane, Rahway, N. J. Filed July 20, 1907. Serial No. 384,824.

1. A transmission mechanism comprising a driving shaft provided with a worm, a casing inclosing said worm, a worm con-

nected with said casing, a valve member surrounding said worms, and means for adjusting said valve member with respect to said worms to cause a fluid like substance operated by said worms to cause rotation of said casing.

899,534. Universal Joint. Ernst G. Hoffmann, New Rochelle, N. Y. Filed June 19, 1907. Serial No. 389,683.

1. A universal joint comprising an inner terminal member provided with pivot bearings, an intermediate member embracing the inner member and provided with internal bosses to receive the pivot bearings of the inner member and with external pivot bearings, and a ring-like outer terminal member having internal bosses with slotted walls to receive pivot bearings of the intermediate member and bearing rings to retain the pivot bearings in the slotted bosses.

899,537. Automobile. Thomas B. Jeffery, Kenosha, Wis. Filed Aug. 25, 1902. Serial No. 120,924.

1. In an automobile, the combination with the frame for supporting the engine comprising side beams, a cross beam supported at its ends by the side beams and a brace extending above the cross beam and also supported at its ends by the side beams, a socket secured to the cross beam and brace of said frame, a steering rod supported within said socket whereby the body of the vehicle may be removed without detaching the steering rod support.

899,611. Wheel. William H. Parham, Paducah, Ky. Filed May 15, 1907. Serial No. 373,796.

1. In a wheel of the class described, the combination of a rim, a hub, spokes secured to the hub and to the rim and including resilient loops, and tension devices movable radially of the wheel between the rim and the hub and connected to one of the said parts and engaging the loops of the spokes to vary the tension of the latter.

899,618. Starting Device for Gasolene Engines. Frank Reynolds, Syracuse, N. Y. Filed Feb. 17, 1904. Serial No. 194,000.

1. In a gasolene engine, the combination with the explosion cylinder, electric spark plug therein, and exhaust means, of a starting device comprising a tank for storing explosive mixture under compression, a passage leading from the tank to a said cylinder, a valve controlling the supply of compressed mixture to the passage, a valve controlling the admission of mixture from the passage into the cylinder, electric contacts, an electric circuit maker and breaker adjacent to said contacts, and a manually operated means for actuating said valves and circuit maker and breaker.

899,620. Tire Inflater for Automobiles. Peter J. Ross, Trevor, Wis.; Donald C. Ross, Rydnre, N. D., administrator of said Pter J. Ross, deceased. Filed Jan. 2, 1908. Serial No. 408,957.

1. An automobile tire inflater comprising an air pump adapted to be coupled to the engine shaft when desired, in combination with a flexible hose of suitable length extending from said air pump and a coupling member on the free end of said hose for attaching the same to the tire plug, said coupling member comprising a tubular handle portion attached to said hose and a transverse tubular portion arranged at the opposite end thereof forming a T shaped member, a coupling nipple arranged at one end of said transverse portion a safety valve arranged at the opposite end thereof, the first said tubular portion having a discharge opening, a valve for closing said opening and mounted upon a suitable parsaid lever being arranged substantially parallel with said handle portion and adapted to be simultaneously grasped therewith to manually depress the valve to close said discharge opening substantially as described.

899,668. Spring Wheel. Henry E. Heaton, Oroville, Cal. Filed May 7, 1907. Serial No. 372,351.

In a spring wheel, the combination of a hub, a hollow annular rib upon the hub and formed of sheet material having the edges thereof extended outwardly to form flanges which are secured to the hub, a body portion comprising an inner rim, a reinforcing casing of U cross section applied to the inner rim of the body portion of the wheel to the annular rib of the hub, alternate strips being arranged in a reverse manner and each of the spring strips having one of their ends secured to the rim upon one side of the whee while the opposite end is secured to the rib on the other side of the wheel, the end portions of the spring lying in approximately parallel planes while the intermediate portion is reversely curved.

GABRIEL HORN MFG. CO. 1417 E. 40th St. Cleveland, O.

THE MAN WHO HAS "BEEN THERE BEFORE"

spends but little time asking what it costs to "buy" the car; what he wants to know is, what does it cost to *"run it after I have bought it?"*

There are cars that are "cheaper to buy" than the Stevens-Duryea, and there are those, too, which cost more, but there is no car anywhere—at any price—which can do the same work that the Stevens-Duryea does at anywhere near as low cost; not cost per mile, nor cost per week or month, but cost per *ten thousand miles*, or cost per year.

The great number of these cars now in use gives daily evidence as to the correctness of this assertion.

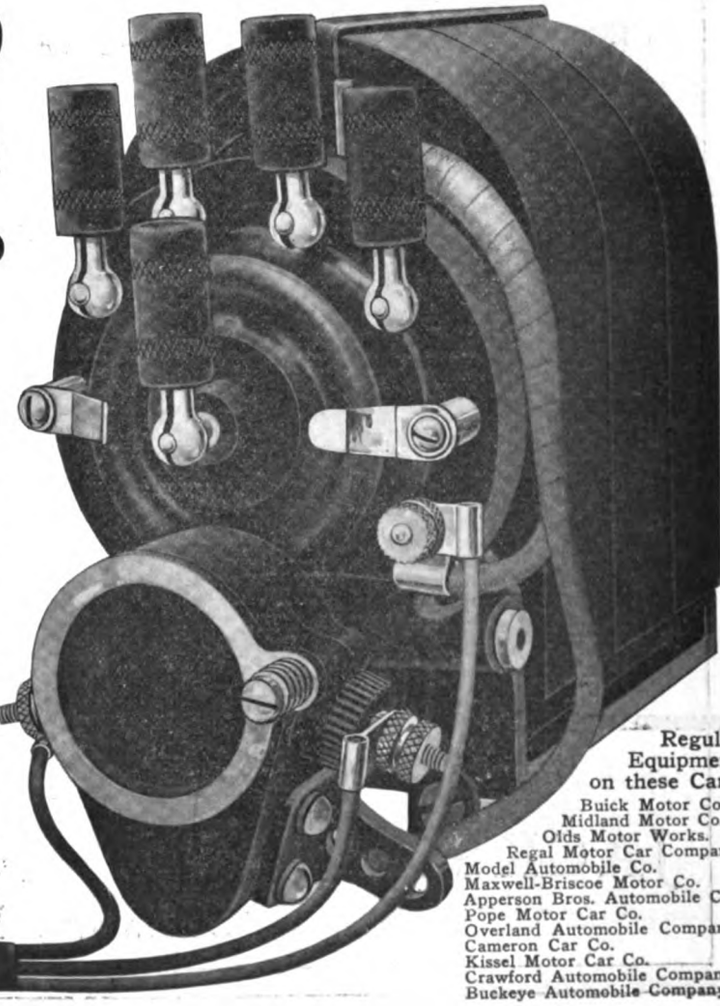
This is the Magneto that Stands the Most Abuse—See it at the New York and Chicago Automobile Shows

The Remy High Tension Magneto is designed especially for American Automobiles. The broadest margins for abuse—both electrical and mechanical—are afforded on the Remy. It is "fool proof."

Positive firing is assured by the Remy under conditions of oil, dirt and water that puts its competitors out of commission.

It will fire the motor properly running at a lower speed than any other Magneto in the world. This is a big point in cities, where cars must be run at low motor speed as often as high motor speed.

Anybody can install a Remy whether he is a skilled mechanician or not.



This is the Magneto without brushes. No brushes to wear out, give trouble or be replaced.

The Remy

1909

High

Tension Magneto

Double ignition with one set of spark plugs is another Remy feature originated by us.

Starting may be done from the seat of the car without cranking—with the greatest certainty of any system starting from the spark.

We have sold on minimum specified deliveries over 17,000 Magnetos for 1909 cars. More of these Magnetos are already sold than all other makes combined.

With automobile manufacturers continually striving to build better cars than their competitors, there is a reason for their adopting the Remy Magneto.

It is designed by engineers who have been connected with automobile work since its beginning and embodies ideas suggested or approved by the largest manufacturers.

Our factory was built especially for Magneto manufacturing and is the largest of its kind in the world.

In the hill climb endurance run—speed contest—in all kinds of tryouts everywhere, the Remy has more victories to its credit than all other makes combined.

Write us today.

This is a sample of the letters we receive daily:

Boston, Mass., Sept. 30, 1908.
"Remy Electric Company.
We have recently entered several racing events and our cars, equipped with your ignition apparatus have all made wonderfully good records.
At Montreal our Model 5 had captured eight out of nine events, beating Christy and Barney Oldfield's machine and tieing for the fastest half mile track in 1.12. This car was equipped with your Magneto and as the report shows, ran faultlessly throughout the several events.
BUICK MOTOR COMPANY,
Boston Branch,
H. K. HOYES,
New England Mgr."

Write us for illustration and full description of our new high tension Magneto. We are building them in such large quantities that we can make you very attractive prices. We furnish fittings for attaching these Magnetos to many of the old models of the different American cars.

The Haynes for 1909, 40 H. P., $3,000.

A Talk To Agents

People are wary of the good-looking car that a chauffeur or an expert is unwilling to commend.

Possibly there are some agents who think that the merits of the Haynes universal joints, for instance, are too technical a matter to interest the average business man that comes in to look at the car. Maybe. But next day that man's friend, who knows an automobile when he sees it, steps in.

He gets into the chassis instead of into the tonneau.

He finds the universal joints with the floating cube of solid steel that can't ever break, and the big wearing faces that never wear out.

He finds other things, too—a unique and simple roller-pinion-and-sprocket direct drive that solves certain old problems at the rear axle, obviating wear, strains, noise and friction at a place that is a danger point in most cars. He finds a better clutch than any other car ever had. He finds a ratchet gear system that prevents gear stripping. He finds a double flywheel on the motor that makes it run like a six-cylinder without a six-cylinder's cost and complication. And he finds tremendous strength, almost needless strength, everywhere.

And the man that sent him may not hear about those technical points, but he does hear something that makes him 'phone the agent to reserve that car till cheque arrives in the morning.

Certain Haynes territory is open this year, and we are ready to talk business if you are just the right man.

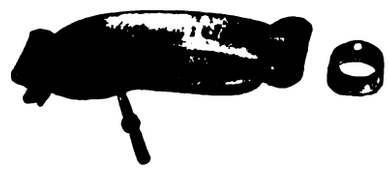
10 Years Foremost



1909 Will Increase Their Lead

Diamond
Wrapped Tread Tires

Logically constructed from the beginning, their advance in efficiency has been logically worked out.

They are preeminently the tires for service.

In the successful manufacture of tires for racing cars we have made exclusive use of that test in its application to work of greater importance—the requirements of every day use and touring.

And our tires for 1909 are built with an intimate knowledge of 1908 results, coupled with the large advantage we have gained by there being more Diamond tires—both casings and tubes—in service than any other two makes combined.

There's also the quick acting rim proposition—and one 100 per cent. efficiency—The Marsh.

Inquiries Receive Every Attention.

What Good Tires Mean To You

Throughout the world Morgan & Wright tires are known as good tires—because they are.

To the motorist this statement of demonstrated quality means much, for—

It is a guarantee against wholly unnecessary repair bills—against all repair bills, in fact, except those necessitated by accident or natural wear;

It stands for protection to the car, which can be secured only by the use of tires that are built to withstand emergency tests as well as ordinary service;

It's an assurance that you will be spared the exasperating inconvenience which always attends breakdowns of any kind—especially those against which you could be protected.

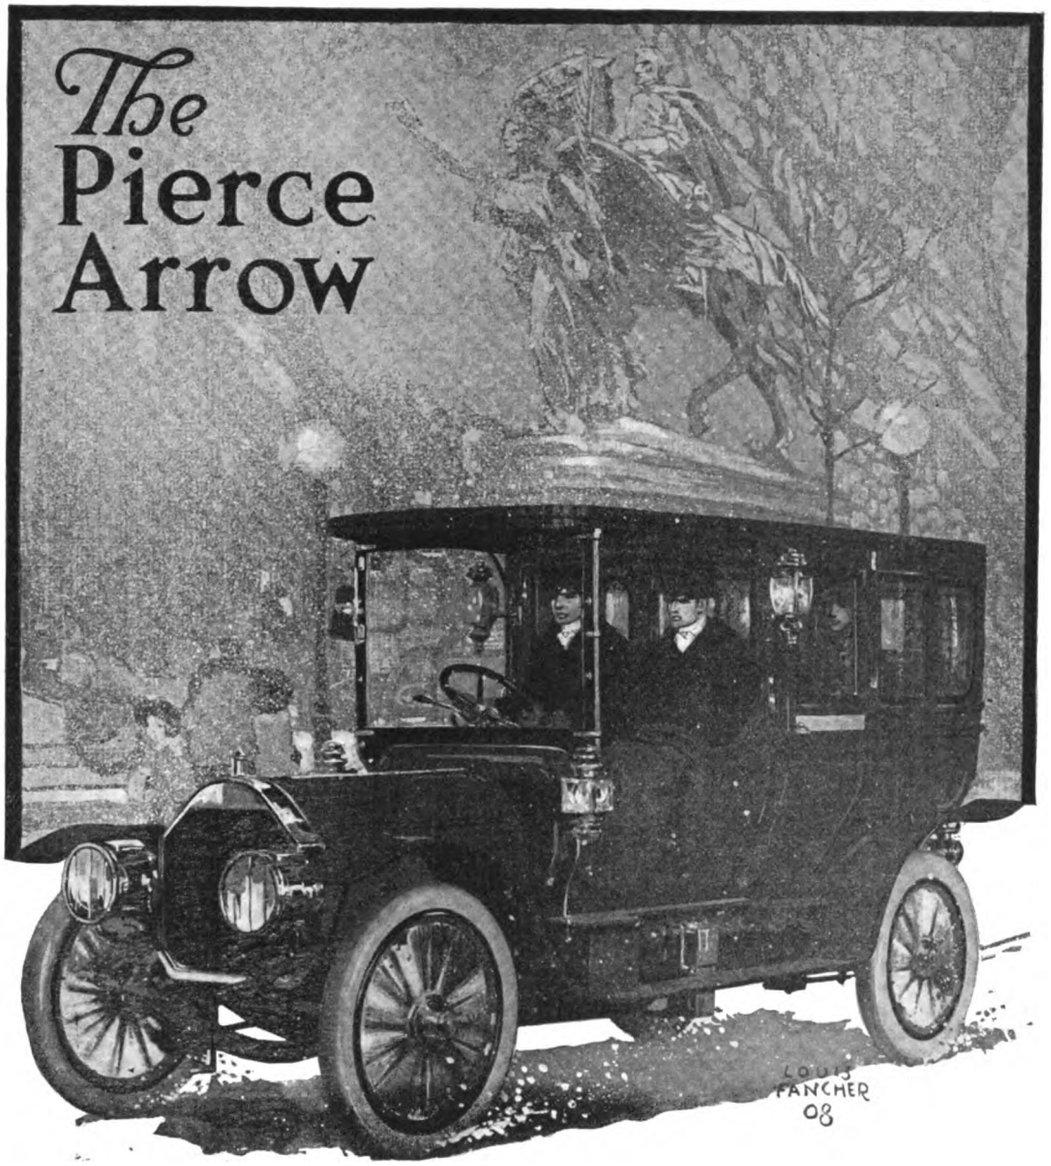
MORGAN & WRIGHT TIRES

have literally won over hundreds of motorists by reason of their protective quality—the quality that makes them absolutely safe under any condition.

Whether this protection is secured through the grade of materials used, or through our method of tire-building, or as a result of extremely rigid inspection which every tire undergoes before it is permitted to leave the factory, is comparatively unimportant to the user.

The vital consideration—and the only one that appeals to the experienced motorist—is this:

These tires actually stand up day in and day out under every condition of both load and road, as only tires can that are made as MORGAN & WRIGHT tires are.



And it is because users of these tires have repeatedly found this to be true, that we invite all motorists to give them an impartial, comparative test.

There is no method of making friends
equal to the method of making good.

MORGAN & WRIGHT, DETROIT

THE SELDEN CAR

MADE BY

"The Father of Them All"

One Price, $2,000. F. O. B. Rochester.

TOURING OAR, ROADSTER, TOY TONNEAU

A genuinely good car cannot be made and sold for less than $2,000. By this we mean a car like the Selden, containing nothing but the best of materials, workmanship and finish. A car that the manufacturer can stand behind and guarantee for at least a year against any imperfections in workmanship or material.

We buy only the best materials, employ only skilled labor and pay particular attention to details and finish, thereby producing a strictly high-grade car at the lowest possible price.

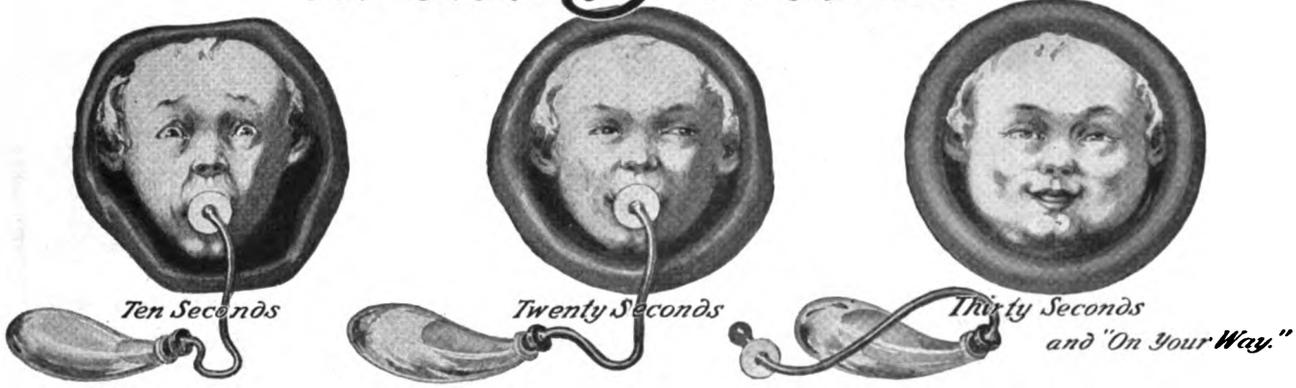
The up-keep and maintenance of a medium-priced car like the Selden is within the reach of any man of moderate means and the value of the car does not depreciate like that of the lower priced cars. This is the point to be considered by every purchaser.

The Selden Car is a 4-cylinder 28-30 horsepower (developing 37 horsepower) five passenger Touring Car or three passenger Roadster, with 114-inch wheel base, 34-inch wheels, shaft drive, selective control, pressed steel frame, metal body, fully equipped.

Superb riding, roomy tonneau, luxurious upholstery, smooth running, great hill-climber, flexible and easily handled, economical in maintenance and up-keep, fine finish, stylish and attractive.

THE COMING CAR OF MODERATE PRICE

Catalog and Agency proposition upon request. Agencies wanted everywhere.



We will exhibit at Madison Square Garden Show.

How To Bring Up A Tire On A Bottle In Thirty Seconds

Goodyear Air Bottle Means No More Tire Pumping

NEVER hear of bringing up a tire on the Goodyear Bottle? Sure! It beats the old-fashioned way of bringing the tire up by hand "all hollow." Not one-tenth the trouble.

And tires brought up on the Goodyear Bottle are well brought up too,—better behaved—more healthy—live longer—do a good deal more work—save you a lot of money.

It's such a big success that we are going to give every motorist in the world a chance to try it free for two years—charging only the nominal cost of the first bottle.

The Goodyear Air Bottle is a small steel bottle charged with pure air (not gas). It is usually carried under the seat or on the running-board of an automobile.

When you want to inflate a tire, you simply attach the rubber tube from the Air Bottle to the tire—open the valve and let 'er fill.

While you stand by and comfortably watch the performance until time to shut 'er off.

Doesn't look much like your old familiar job of giving an imitation of your wash lady in the midst of her Monday morning exercise, does it? Doesn't feel like it, either.

No more back-breaking, hand-blistering tire pumping! That grim task which robbed motoring of its pleasure can be crossed *off your list of troubles.*

Any woman or child can inflate a tire with the Goodyear Air Bottle—it's so simple.

And the beauty of it is that the tire can be brought up to just the right pressure.

This is important. It makes tires last 50 per cent longer. Under-inflated tires give out quickly.

By inflating to *exactly the right pressure* with the Goodyear Air Bottle, rim-cuts and other tire troubles are avoided. Ninety per cent of tire troubles come from under-inflation.

If you have Goodyear Detachable Auto Tires on Goodyear Universal Rims, the Goodyear Air Bottle will enable you to be on your way a few minutes after the puncture occurs.

And with *any* tire, it cuts out half the work and drudgery.

Any motorist in the last Glidden Tour can tell you what a blessing the Goodyear Air Bottle is. A big truck loaded with Goodyear Air Bottles met the tourists from day to day at the various points of the tour.

All contestants who desired the Free Goodyear Air Bottle service were supplied, regardless of the kind of tires they rode.

Every day the empty bottles were taken back and replaced with fully charged ones.

Thus, the Glidden Tourists always had a fresh filling for a deflated tire right at hand—no delay—no labor.

Altogether the Goodyear Air Bottle was voted the best thing that had happened since the Glidden Tour began.

Write us for our "The Care of an Auto Tire," which gives valuable information about the care of tires and the exact pressure to which each size of tire should be inflated to give the longest service.

Our Offer to all Motorists— Free Air for Two Years

The Goodyear Air Bottle costs only $15 for the small bottle designed to carry under the seat, or $20 for the larger bottle, which is designed for carrying on the running board, filled with compressed air—no gas to ruin the tires, corrode the valves, or condense within a few hours, leaving the tires soft, thus making it necessary to constantly repeat the operation to maintain the desired pressure.

The first cost is the only cost for two years, thereafter we may make a nominal charge for refilling. But for two full years, when the bottle is empty you simply turn it in at any Goodyear Branch or listed agency and receive a new bottle, ready charged.

You do not have to wait. You exchange the empty bottle for a new charged one instantly. Each small bottle will fully inflate four to eighteen clincher tires—according to their size—and each large bottle from six to thirty-five. They will partially inflate many more. The bottles will inflate approximately 15 per cent fewer Goodyear Detachable Tires than Clincher Tires of corresponding size, the reason being that the GOODYEAR DETACHABLE TIRE IS 15 PER CENT OVER SIZE.

FOR 1909 THE

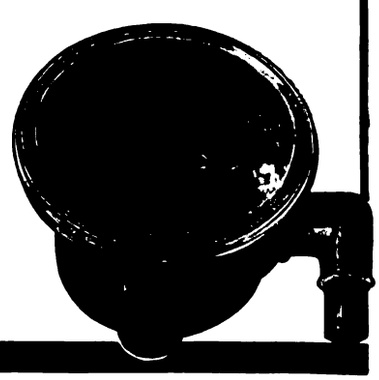
Jones Speedometer

presents the most complete and handsomely finished line of speed-indicators ever offered!

The JONES was the first speed-indicator built for automobile use—the Pioneer. From its very inception it was recognized as a PERFECT SPEED-INDICATOR. During the nine years it has been on the market the JONES has withstood every test and trial with a perfect score and has maintained the highest possible standard for

UNFAILING ACCURACY—CONSTANT RELIABILITY—EFFICIENCY

It has always been the first to adopt every refinement and improvement—other manufacturers follow its example and initiative. In handsome appearance and *actual* performance, it is not even approached by any other instrument. It is the Standard of the World—the speed-indicator by which *all* others are judged—the speed-indicator you want for *your* car!



20 different instruments raging in price from $15 to $100. Speedometer and Clock Combinations (Chelsea Movement) from $55 to $150. See our exhibits at both shows!

The Best Magneto Investment

Is a

SPLITDORF

Not merely because it is made by the oldest and largest ignition specialty firm in America, but *because of its real value as a Magneto.*

The motoring public recognize that the creative genius exercised and the infinite pains expended in SPLITDORF construction demand a somewhat higher price, but in proportion to value received the SPLITDORF is

THE MOST MODERATE-PRICED MAGNETO IN EXISTENCE

Once and for all, it is the best that money will buy.

Fifty years of electrical engineering experience behind it.

Every part of this superb mechanism is of the most excellent material, and the construction is by the highest skill obtainable in America, embodying in every detail the most important improvement known to Magneto building. Its simplicity enables the inexperienced to install and adjust it without losing any of its efficiency. We emphatically claim it is the Most Scientific in Design, the Most Effectual in Operation, the Most Carefully Built of any Magneto extant.

Be sure to specify the SPLITDORF MAGNETO for your 1909 car. Being thus equipped you will be assured faultless ignition every day in the year.

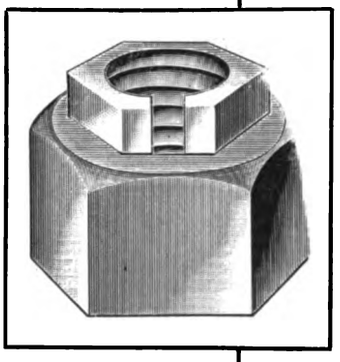
"Locking the door after the pony is stolen"



is a good deal like postponing the use of

Columbia Lock Nuts

Now

for it's only a postponement at best. Why not take a double-twist on the forelock of old Father Time and incorporate the use of Columbia Lock Nuts in your construction BEFORE you have occasion for regrets? Columbia Lock Nuts are in general use and are regarded as a necessity by some of the biggest railroad systems in the country. They ought to be a double necessity on automobiles. They are already used by many prominent makers. They should be used on every automobile everywhere.

¶Columbia Lock Nuts simply cannot work loose. Vibration, even the constant vibration of solid tires, cannot affect or loosen them. They are automobile insurance of the very best kind and their cost is not a factor. Let us prove our case.

COLUMBIA NUT & BOLT COMPANY

Bridgeport, Connecticut

E-M-F "30"

$1,250

F. O. B. DETROIT, MICH.

Magneto Included—Of Course

IF YOU'VE DECIDED TO BUY AN AUTOMOBILE

AN AD-FULL OF ADJECTIVES—a page of pretty platitudes— will not suffice to appease your craving for facts and figures—if you've made up your mind you will buy a car and it's now only a matter of deciding which car will best suit your particular needs.

YOU WANT INFORMATION—some facts you can tie to—some points you can compare—and the more the better—with similar points in other cars.

SO WE WON'T WASTE WORDS in this ad—we'll give you facts boiled down in the form of complete specifications showing just how the E-M-F. "30" is made, of what, and why.

YOU'LL FIND BY COMPARISON that this car is a full-sized, 5-passenger automobile. Same dimensions as other cars selling for twice as much, and larger—much larger—than any other car selling for the same price.

IF YOU ARE VERSED in the mechanical lore of motor car construction you will find all you desire here. If you don't know, then you know someone who does know—and the more he knows about points that spell superiority in a car the stronger will be his verdict in favor of the E-M-F. "30."

AFTER YOU HAVE DIGESTED THIS thoroughly look up the nearest E-M-F. "30" dealer—there are 500 of them—and arrange for a demonstration—that will settle the question.

SPECIFICATIONS

TYPE. 4 cylinder, Vertical, 4 cycle. Cylinders cast in pairs with water jackets integral. *Water space between cylinders* ensuring uniform expansion and contraction. Valves all one side. Mechanically operated. Interchangeable.

CYLINDERS. Bore 4". Stroke 4½". Compression—moderate. All experience has proven these cylinder dimensions to be nearly ideal for all kinds of service. They give a motor of moderate speed—which means long life. Cooling, lubricating and all other troubles which arise from short stroke, excessive bore, small exhaust valves and short bearings are entirely eliminated in the E-M-F. "30."

CRANK CASE. Cast from highest grade aluminum. Hand hole covers, stamped steel. Instead of the usual cast aluminum arms for supporting motor in frame the E-M-F. motor is carried on pressed steel members in "U" section—no heavier—three times as strong.

VALVES. Are extra large—2⅛"—made from special steel, drop forged. Stems and seats ground. Valve guides machined and pressed into place instead of being cast integral with cylinders—easily replaced when worn.

All engineers agree that large valves not only make for efficiency, but also for economy. A four cylinder motor of 4" x 4½" may, by scientific design, accurate workmanship and large valves be made to develop 30 to 35 horse power at 1000 revolutions per minute, or it may develop 16—if valves are under-size or the design faulty in other ways.

VALVE PORTS. Inlet and exhaust passages very large and unobstructed—eliminating all chance of eddy-currents, ensuring maximum power efficiency and perfect cooling qualities.

VALVE OPERATION. Single cam-shaft made from high grade steel, drop forged with *all cams integral.* After milling, cam-shaft is case hardened, and all cam surfaces as well as bearings are ground to micrometrical accuracy—guarantees silent running and consistent performance at all times.

CRANK SHAFT. *Is off-set* ⅜" from centre line of cylinders—still another increase in power efficiency with minimum of wear on cylinder walls and pistons. Crank shaft, drop forged from special steel. Three main bearings—all large and extra long. *All bearing surfaces ground.* Flange, forged integral on crankshaft carries fly-wheel—ground to ensure perfect centre. Fly-wheel is also given a *running balance* at maximum motor speed to ensure accuracy and absence of vibration.

CRANK SHAFT BEARINGS. Special babbit ("White metal" alloy) in accordance with best modern practice. Cam-shaft bearings phosphor-bronze.

CONNECTING RODS. Drop forged steel. I-beam cross section. Crank-pin bearing equal length each side of centre—not off-set. Piston pin bearings, phosphor-bronze. Wrist pin bearings, marine type—not hinged. Lined with die-cast babbit. Shims provided for adjustment, which is easily made through large hand holes in bottom of crank case.

PISTONS. Extra long—5"—ensuring good compressing and long life. Each piston ground, fitted with four rings, and *each set is weighed* to ensure perfect balance of reciprocating parts—a talking-point with some makers—a matter of course with us.

PISTON RINGS. Eccentric type; ground on periphery-face to conform to exact bore of cylinder; also on both sides.

PISTON PIN. Special case-hardened steel ground; drilled hollow to ensure perfect lubrication. Pistons, connecting rods, crank-shafts and *all reciprocating parts are mechanically balanced* to eliminate vibration.

LUBRICATION. Splash—automatic, vacuum feed—reliable and economical. Oil reservoir cast integral with aluminum crank case. After having tried countless mechanical "positive feed" oiling devices and found them all wanting in some particular, foremost engineers have decided that the only really positive feed is by gravity; and experience proves that no amount of piping to cylinders and bearings will ensure the same liberal oiling to all moving parts as the old, original splash system, by which the entire mechanism is kept constantly bathed in oil. The one shortcoming of the gravity feed system was the necessity for throttling the feed to prevent flooding, and the tubes frequently became clogged at the valves.

Digitized by Google

By our system of vacuum regulation—the utilization of one of the simplest principles in nature—we are able to use large tubes, ⅜". This absolutely insures free flow of oil from the reservoir, and a constant level in the crank case. Radius: on one filling of oil reservoir, 300 to 500 miles according to road conditions.

COTTER PINS, lock-nuts, keys and taper pins are used at every point to guard again any part getting loose.

OIL CUPS. Are provided for every joint that may at any time require lubrication—steering knuckles, spring connections operating shafts, etc., etc.

IGNITION. Double system, consisting of (a) magneto, (b) battery. The magneto is not an extra or "special equipment." It is as much a part of the E-M-F. motor as the valves, and is included in the list price of the car. Gears and all moving parts enclosed in oil tight, dust and water proof case. In this regard the E-M-F. car sets a pace for the world, high priced cars included.

ENGINE GEARS. Cam-shaft and Magneto gears all enclosed and separated from crank chamber. Gears lubricated by non-fluid grease—not cylinder oil.

COOLING. Is by large centrifugal pump—high efficiency at slow engine speeds ensuring cooling in hill climbing and hard pulling over muddy roads. Belt driven, stamped steel fan mounted on engine—not attached to radiator. Eccentric belt adjustment.

CARBURETOR. Improved simple float, single jet—our own design. Very flexible and economical. Carburetor is located on driver's side of motor, away from hot exhaust pipes and other parts—readily accessible.

CLUTCH. Improved expanding-ring type. Leather faced. Contained in fly-wheel. Oil groove in fly-wheel with holes drilled for escape of oil obviates all liability of clutch slipping from this cause. Takes hold gently—and holds when engaged. Adjustment, accessible and easy.

TRANSMISSION. Type—Selective sliding gear. Gear case integral with differential housing in rear axle—"the unit power transmission system" so generally approved by engineers of late. Gears made from E-M-F. formula special steel. Accurately cut and oil treated. Instead of squared shaft for sliding gears, round shaft with four keys integral has been adopted—key-ways milled and *ground. Gear centers also ground* to ensure perfect alignment on shaft and silent running—details of construction heretofore known only to the highest priced cars.

SPEEDS. Three forward and reverse—direct on third.

GEAR RATIO. Standard, 3¼ to 1. Speed of car, 50 miles an hour, down to 2, (you won't believe it till we show you) on high.

DRIVE. Direct through universal jointed propeller shaft to bevel gear on differential. Two universal joints. Pressed steel torque shaft. Gears extra large, accurately cut and made from special alloy steel.

DIFFERENTIAL. Bevel gear type—four pinions—another feature heretofore considered too expensive for any but high priced cars.

REAR AXLE. E-M-F. exclusive design. Right and left housing sections drawn from sheet steel and heat treated, giving extra strength. Fitted with truss rods. Hyatt Roller Bearings in hardened and ground removable sleeves carry load. Differential thrust bearings, babbit between ground steel washers. No balls to split—no adjustment to get out of order. Made right to stay right. Thrust of drive pinion supported by Timken Roller Bearing.

Auto-genous welding—acetylene-oxygen process—discussed so much in engineering circles and trade journals of late is used in this axle as well as in several other parts of the car.

Thanks to drawn steel, auto-genous welding and "clean" design this axle is lighter than any other live or floating axle on cars of similar weight and power—notwithstanding the entire transmission mechanism is incorporated in it.

All gears—transmission and differential—as well as all shifting mechanism, are immersed in an oil bath. And the transmission-axle case as well as motor crank-case are absolutely oil tight—no mucking of floor boards or dripping on pavements. Provision is made to prevent the oil working out at the axle ends when the car is left standing on an incline. Liberal road clearance.

FRONT AXLE. I-beam type. Drop forged in one piece—not welded in centre. Heat treated. Spring perches forged integral. Liberal safety factor. Spindles off-set back of yoke-posts—scientifically correct—affords easy steering, with tendency to go in straight line. Steering knuckles and all connections drop forged from steel—no castings. Two-point ball bearings in hubs and all joints bronze bushed.

STEERING GEAR. Irreversible, worm and sector made from special steel case hardened. All bearing surfaces ground. Connection from steering arm, at right, to left knuckle arm, obviates all tendency to "crankiness" on rough roads.

CONTROL. Gear-shift lever at right of driver. Throttle and spark levers on left side of steering post, below wheel—operated by fingers of left hand without releasing grasp on wheel. Right-hand free for emergency brake and gear shifting—the ideal control, rapidly superseding the fad for levers on top of wheel. Auxiliary foot accelerator. Clutch operated by left foot, service brake by right foot. Emergency brake by hand lever on right—ratchet lock.

WHEELS. Artillery type. Large spokes—12. Spokes and felloes first grade second growth hickory.

TIRES. 32" x 3½" on all wheels. Morgan & Wright. Universal quick-detachable rims.

BRAKES. Four—all acting on rear hubs—none on transmission. Service brake, contracting steel bands, camel-hair lined, acting on pressed steel drums integral with rear hubs. Emergency brakes, internal expanding rings in same drum—metal-to-metal. Both sets double acting. Grip on drum is intensified by motion of car after brakes have been applied. Service brakes being on outside renders adjustment easy. Pressed steel disc closes drum making it dust proof.

SPRINGS. Front, semi-elliptic. Rear, full elliptic. Extra wide for this weight of car—2". Driving thrusts and braking strains taken by two radius rods—not by springs.

FRAME. Pressed-steel—U-section. Side-members straight—weakened neither by off-setting nor dropping.

MUFFLER. E-M-F. design. Silences by radiation—not by obstruction. Absolutely no back-pressure.

FENDERS. Enameled steel in the newest style, most approved enclosed-full-length-of-the-car type.

MATERIALS. Cylinders made from special formula highest grade, fine grain, gray iron. Intake pipe, brass. Exhaust pipe, gray iron. Crank case, aluminum. Frame, gears, springs, axles and driving shafts all made from special steels—each from an alloy best suited to its peculiar service, and all from E-M-F. formula. Operating levers, spring supports, spring clips, shackles, brackets rod-ends, etc., steel, heat treated. All smaller parts, not drop forged, are pressed or stamped steel—*no malleable castings* enter into the construction of the car—maximum strength with minimum weight, and *absolute assurance* of the safety factor desired.

BODY TYPES.

TOURING CAR. 5 passenger, roomy tonneau with liberal leg-room. Latest style, most approved, straight-line type. Handsomely finished.

The "TOURABOUT"—an E-M-F. innovation. A classy 4-passenger car. Rear seats detachable, leaving room for trunks and baggage. A rumble seat is included in regular equipment; when attached makes a natty 3-passenger roadster.

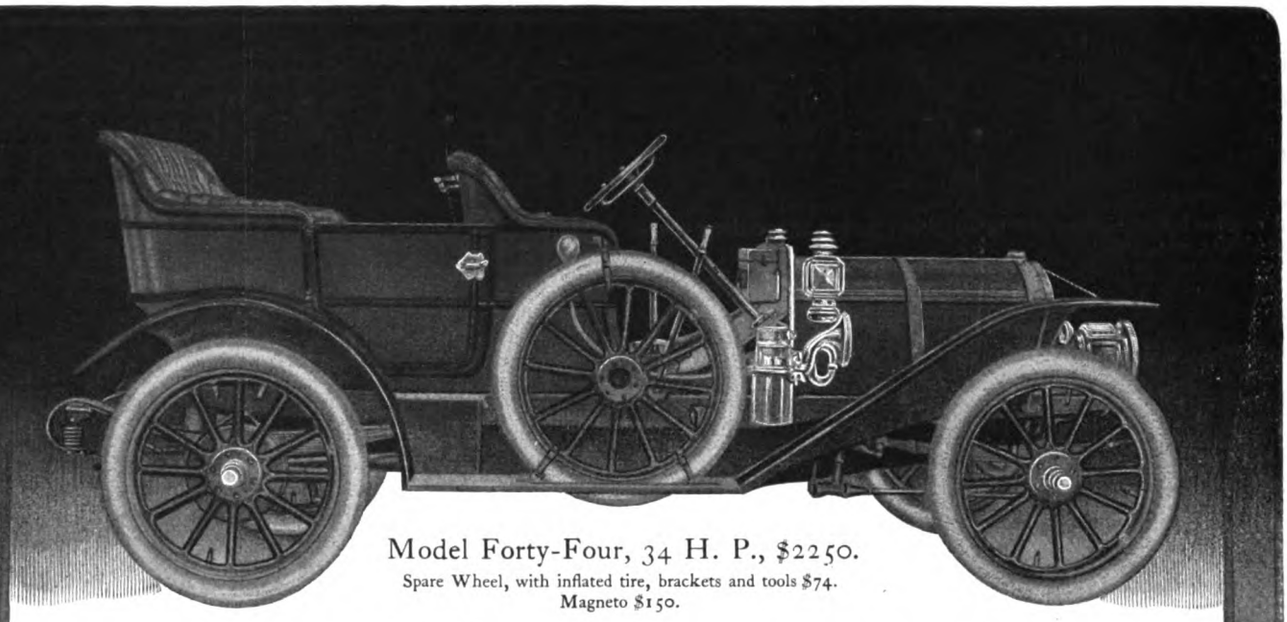
WHEEL BASE. 106". TREAD. Standard—56½".
Special for Southern Roads 61".

WEIGHT. Touring Car slightly under 1800 pounds.

GASOLINE CAPACITY. 15 gallons. OIL, 1 gallon.

COLOR. E-M-F. Red.

PRICE. With standard equipment, pair acetylene headlights, and generator; side oil lamps, tail lamp, lamp brackets, tube horn, tire repair kit and tools—magneto included of course—$1,250 F. O. B., Detroit, Mich.



We will exhibit at the Madison Square Garden Show, January 16th to 23rd, 1909.

EVERITT-METZGER-FLANDERS COMPANY

Members Association Licensed Automobile Manufacturers.

DETROIT, MICHIGAN

Model Forty-Four, 34 H. P., $2250.
Spare Wheel, with inflated tire, brackets and tools $74.
Magneto $150.

THE SAFETY SPARK RETARDER

There is absolutely no danger in cranking a Rambler when properly adjusted. The starting crank then cannot engage until the spark has been automatically retarded.

Every one who has had the unpleasant experience of a premature spark in starting an automobile will appreciate the Rambler safety starting device. This prevents an explosion ahead of center, even though the operator forgets to retard the spark.

You cannot engage the lug on the shaft with a tooth on the starting crank until the spark-retarder lever has moved from the position of the dotted line to the position shown, thus retarding the spark.

Rambler

The Car with the Offset Crank Shaft

Seven passenger model, forty-five horse power with offset crank shaft, $2500. Other models, $1150 to $2500. Write for catalog describing in detail Rambler offset crank shaft, Spare Wheel, straight line drive and other exclusive features of the new Rambler models.

THE CAR OF STEADY SERVICE

THE MOTOR WORLD

Volume XIX. New York, U. S. A., Thursday, December 31, 1908. No. 14

METZ ACQUIRES WALTHAM PLANT

Former President of the Company Springs a Surprise—Will Produce Runabouts and Light Commercial Cars.

Interests represented by C. H. Metz have purchased the plant of the Waltham Manufacturing Company, of Waltham, Mass., of which concern he was the president at a period when it was making bicycles and when it first undertook the building of automobiles. When he severed his connection with it, he engaged in the manufacture of motorcycles, an enterprise which was subsequently merged with the American Motor Co., of Brockton. He recently withdrew from the latter company, but his acquiring the Waltham plant at this time comes in the nature of a surprise.

As one of the pioneer concerns in the business, the Waltham company enjoyed considerable early prominence and was among the first members of the Association of Licensed Automobile Manufacturers. Latterly, however, although its various "Waltham-Orient" productions have exhibited no small variety and ingenuity from year to year, the company's receipts have not borne a satisfactory relation to its outlay, in consequence of which its success has languished. So far as the future plans for the factory have been divulged, it will in all probability be devoted to the production of runabouts and light commercial cars.

Ludlum Becomes Autocar Head.

David S. Ludlum has become the head of the Autocar Co., of Ardmore, Pa., assuming the position of president and general manager. Because of his enthusiasm as to the future of comercial vehicles, a side of the industry to which the Autocar Co. has given the major part of its attention for the last two years, Ludlum resigned as assistant cashier of the Philadelphia National Bank to take the direction of Autocar affairs. John S. and Louis S. Clarke, the founders of the concern, will retain their positions as vice-president and consulting engineer, respectively, and will continue their present active connection with it. A special commercial chassis which the company has developed will be utilized in delivery wagons, town cars and taximeter cabs.

Greuter Organizing a New Company.

Having produced a six cylinder car embodying a number of original features, C. R. Greuter, formerly with the Matheson Motor Car Company, of Wilkes-Barre, Pa., has organized the nucleus of a manufacturing company which is to be launched at an early date. The enterprise has its present headquarters at Saugus, Mass., where the car is being built. A number of well known Massachusetts capitalists are interested in the project. Greuter's production is rated at 50 horsepower. It has chain drive and features in the motor a new form of double valve for which much is claimed.

McLachlan Resumes His Cleveland Post.

Archie McLachlan has returned to his former post at Cleveland, O., as salesmanager for Royal cars. For the past six months he has had charge of the Chicago branch of the Royal Motor Car Co., of Cleveland, which was recently reorganized as the Royal Tourist Car Co. His successor at Chicago has not yet been appointed.

Herz Moves to Bigger Factory.

Herz & Co., makers of ignition and other automobile specialties, have removed their office and factory to the Puck building, 303-9 Lafayette street, New York City. The ground floor has been fitted up to suit their requirements, providing more than twice the former factory space.

Splitdorf Establishes Boston Branch.

A selling branch for the Splitdorf Laboratory, of New York City, has been established in Boston. It is located in the Motor Mart and is in charge of James Rohde.

MAY REPRODUCE THEIR CARS HERE

Foreign Makers Prospecting for American Factory Sites—Preparing for Failure of Plea for Lower Tariff.

Failing to secure a reduction in the tariff, a failure for which they are not unprepared, several of the most prominent foreign makers will establish branch factories in the United States, according to information from sources directly in touch with the foreign car situation. Reports were current this week to the effect that arrangements are being made to manufacture Fiat cars in Detroit, Mich., already famous for the number of its automobile plants. Investigation by the Motor World discloses that while no definite plans have been decided upon for the location of a Fiat factory in Detroit, considerable work has already been done by the Fiat people in obtaining information and propositions from various towns and cities as to what inducements would be offered in case it were desired to establish an American factory for the production of authorized duplicates of the Italian models. Furthermore, it transpires that not only the Fiat, but the Panhard, Isotta, Renault and other foreign interests are taking much the same steps looking to the establishment of American factories in case the efforts for a reduction in the motor car tariff fail.

Until the tariff matter is practically disposed of by Congress the foreign interests propose to take no steps other than to acquire data as to what localities will offer the greatest manufacturing advantages or financial assistance. It is an open secret, however, that many of those interested in the foreign cars entertain little or no hope that the tariff will be changed for their benefit, and are actively developing their plans for American factories to a point where prompt measures can be taken immediately the tariff question is out of the way.

As the representatives of the foreign cars

Digitized by Google

see the situation, the present rate of tariff makes it more difficult each year to compete against the American made cars. Nevertheless the American market is such that the foreign makers by no means wish to relinquish it, particularly as much money and effort has been spent in the past in giving an advertising fame to the better known productions from across the water. A large cash value is supposed to attach to the names of the well known foreign cars, and if the products cannot be successfully imported in the face of the tariff duties, then the plan will be to make the cars over here with such prestige in name and design as the foreign factories can lend.

In explaining the line of campaign which several of the foreign makers have decided upon, a representative closely in touch with several of them pointed out that at present many of the foreign factories are largely equipped with American machine tools. If the project for American factories goes through, at least one or two of the foreign makers will greatly reduce their home factory equipment and production and will ship a part of their American machinery to the new factories in the United States. Such machinery would come in free of duty.

It is claimed that the question of American wage rates and manufacturing costs has been thoroughly gone into by the foreign makers and those conducting the investigation for them on this side. With tariff arguments in mind, some of them have even gone so far as to prepare statistics on the subject calculated to show that the difference in wages paid in America and abroad makes a cost difference of about 17½ per cent., though the methods of arriving at this figure are by no means convincing. Arrangements for obtaining special metals and parts at advantageous figures are also said to have been made.

The various failures and cases of indifferent success attending past efforts to transplant foreign cars serve to encourage the view that further projects of this kind are not likely to meet with any very happy result unless conducted with rare skill and sagacity. In meeting the established American manufacturers on their own ground the foreign makers would find themselves stripped of all advantages in cheap labor and the like, and would even lose whatever selling value attaches to the "imported" label. While established trade names, such as many of the foreign cars enjoy, are to be considered in the light of commercial assets, yet it is doubtful whether they form an adequate basis for an attempted "foreign invasion."

Wallace Goes to the Colburn.

Kyle Wallace, formerly with the Maxwell-Briscoe Motor Company, Tarrytown, N. Y., has been made superintendent of the Colburn Automobile Company, of Denver, Colo. His immediate work will be the production of the 1909 model which the company will make and market.

FLUCTUATIONS IN RUBBER PRICES

Sudden and Frequent Rise and Fall and Its Probable Cause—Brazilian Aspect of the Situation.

Para rubber suitable for the manufacture of automobile tires has been playing active capers up and down the ladder of prices during the last few months, reaching heights that threatened even to affect retail prices considerably and then dropping back with unexpected suddenness. After a recent downward movement of welcome proportions it is again climbing toward upper rounds, and at no time of late has it approached the modest price levels of a year ago. These high prices, however, accumulate on the material during its transportation from the producing grounds in Brazil to New York, acording to a consular report from Rio de Janeiro which indicates that the producers are only getting very low prices and that the buyers are in combination to keep the figures at a minimum. So great has been the depression of prices at the producing grounds that rubber production is threatened, and a part of the district now devoted to it may be turned to other agricultural lines which will prove more profitable. The corresponding reduction in output would greatly affect the market.

"The industrial, commercial and financial situation in Northern Brazil, due to the present and prospective low price of rubber," says Consul General George E. Anderson, of Rio de Janeiro, "continues to merit the careful consideration of the commercial world generally.

"The unfavorable condition, economically, of so great a portion of Brazil is ascribed by some of the rubber men to the lack of proper banking and credit facilities for the financing of the rubber crop, so that producers, or rather the middlemen standing in the position of producers, may be able to hold the crop until the markets of the world are willing to pay higher prices for the product. An organization of rubber dealers is favored for the purpose of resisting combinations of buyers which it is said exist for the purpose of keeping prices low.

"What the present situation means to the great rubber country of Brazil in a governmental way is indicated in the annual message of the Governor of Para, which shows that there was a shrinkage in the revenue of the State, nearly all of which comes from a tax of about 25 per cent. effective on the value of rubber exported, of $458,404 between the last quarter of 1907 and the same quarter of 1908, and there was a shrinkage of $528,540 between the first quarter of 1908 and the same period in 1907. In the fiscal year of 1905-6 the revenue of the State was placed at $4,619,828, while for the coming year it is placed at $2,132,100. The States of Amazonas, Matto Grosso, Goyaz and other rubber producing commonwealths suffer in a similar way.

"The situation is important in a general commercial way," he continues, "not only as explaining present conditions and prospects in the way of imports into Brazil, but also from the fact that unless there is an immediate and radical change in rubber prices, a change which appears to be very improbable in view of the immense extension of rubber plantations over the world generally, there must be a complete revolution in the industrial, commercial and agricultural life of about half of the territory of Brazil."

German-American Agreement on Patents.

Possibly through another of the Kaiser's "calculated indiscretions," it has leaked out that a treaty between Germany and the United States is in process of negotiation looking to a satisfactory reciprocal patent agreement by which the inventors of the two countries will be relieved of some of the more onerous restrictions and requirements that the natives of each encounter in dealing with the other's patent office. The most apparent benefits of the arrangement that is proposed would accrue to the American inventors in the improvement of conditions governing the maintenance of patents in Germany. In the past it has been necessary to actually manufacture in Germany or to pay fees for a recognized bribing of the necessary officials to get a certification that they were satisfied that the patentee was working the invention in the Fatherland. The new regulations would abolish such requirements and would be more liberal in other respects. The German inventors have little to complain of as to the United States patent office. The favorable disposition of Germany as to making the concessions asked for is suggested as being actuated by a desire to appear in direct contrast to England, which has antagonized the rest of the world by its recent patent enactment requiring that manufacture must take place in Great Britain to keep a patent valid.

Dow Tire Elects Coats President.

Changes in the Dow Tire Company, of New York City, have resulted in the retirement of Alexander Dow as president and H. D. Gue as vice-president. The election of officers resulted in the choosing of Alfred M. Coats as president and Gen. James B. Burbank as vice-president, while A. V. R. Barnewall and Sydney Perry succeed themselves as treasurer and secretary, respectively. Barnewall is also general manager of the concern.

End of Pope Motor Car Receivership.

By a final and complete settlement with its creditors, the Pope Motor Car Co., of Toledo, O., will in a few days effect a discharge from the hands of the receivers. The concluding Steps in the program only await the necessary formal court approval.

Digitized by Google

HART WANTS THE CORBIN MOTOR

Negotiations Opened for Purchase of the Business—Two Offers Made but the Outcome Yet Uncertain.

Negotiations looking to the purchase of the Corbin Motor Vehicle Corporation, of New Britain, Conn., by its former president, Howard S. Hart, have been in progress for some weeks. Hart resigned from the presidency of the company about a month ago, being succeeded by President Charles Glover of the Corbin Screw Corporation. It is not long since he also resigned the presidency of the Russell & Erwin Co., of New Britain, so that he feels himself in a position to concentrate his energies on the automobile business should he succeed in acquiring the Corbin business.

It is understood that he has made two propositions to the American Hardware Corporation, which owns the Corbin Motor Vehicle Corporation, but neither of these have as yet met with acceptance. A committee has been appointed by the directors of the American Hardware Corporation to consider what shall be done as to the future of the automobile company. The chairman is Charles H. Parsons. No formal report has been prepared by the committee as yet, according to Parsons, and President Glover is proceeding to push the Corbin automobile affairs with a vigor untouched by possibilities of the business being sold.

Alleged Infringement in Spark Plugs.

Infringement suits have been brought against Ralph Burton, of Peru, Ind., by the Rajah Automobile Supply and C. E. Mezger, Inc., of New York City, alleging violation of the plaintiffs' patent rights, respectively, relating to the manufacture of spark plugs for automobile motors and gasolene engines. The suits were filed in the United States Circuit Court, at Indianapolis, on the 14th inst. Burton is thought to have manufactured certain styles of spark plug porcelains of particular design and imprint, with more diligence than discretion.

Preparing for Big Output of Wheels.

The Pontiac Wheel Co., of Pontiac, Mich., is now manufacturing automobile wheels. An addition is being made to the plant which will double the output, and the concern estimates that it will make 15,000 sets of automobile wheels during the coming year.

New Pope Company Retires Series of Notes

In such easy circumstances has the new Pope Manufacturing Company, of Hartford, Conn., started its career that after having taken over the property and assets of the old company from the receivers, it has anticipated one of the three groups of mortgage notes provided for under the reorganization plan by paying off the 1911 series, amounting to $267,000, two years and seven months before maturity. To insure sufficient ready cash upon which to conduct business, the reorganization program included the issuance of $800,000 in mortgage notes, divided into three series, maturing respectively in 1909, 1910 and 1911. The directors of the new company, upon a consideration of its bank balance, decided that there was ample to take up at least one of the series at the very start, the long term series being selected because of the greater saving in interest. This series has therefore been withdrawn from the underwriters, and instead of being offered to the financial public will be filed among the company's cancelled liabilities.

Automobile Coaching Company in Trouble.

Bankruptcy proceedings have been brought against the Automobile Coaching Co., 147 Spring street, New York City, by Louis Ginsberg as administrator of the estate of David Ginsberg. The claim is for $2,361 on a judgment obtained last May for the death of David Ginsberg. It is alleged that the company made an assignment on December 1 and transferred $3,000 assets. The liabilities of the concern are given as $13,531, nominal assets $80, and actual assets $24.

Pittsburg to Have a Taxicab Company.

Despite its numerous hills and its congested streets, Pittsburg is to be a taximeter cab city. The Pittsburg Taxicab Co. is to make application to the governor of Pennsylvania on January 12, for a charter. The men who are back of the enterprise include J. L. Shearer, Jr., John W. Weibley and Charles B. Prichard. They are represented by the legal firm of Weil & Thorp.

Miami Wins Suit Against Pope.

As the result of holding $1,000 deposited with it by the Miami Motor Car Co., of Dayton, O., suit was brought against the Pope Motor Car Co. recently by the Miami company. The defendant demanded the money for damages when the plaintiff discontinued the sale of its cars. A jury hearing has resulted in a verdict for the Miami company of $765.10.

Poole Returns and Will Rest.

John L. Poole, one of the widely known men in the trade, who has been abroad for some time representing a line of American cars, has returned. He will terminate his present arrangement on January 10, after which he intends to take a much needed rest before resuming active duties.

To Build Automobile Hearses.

Motor propelled hearses are to become one of the regular lines of manufacture of James Cunningham & Sons Co., of Rochester, N. Y. The concern has made horse drawn hearses for many years.

EXTENDING THE "DRAWBACK" LIST

All Members of the A. L. A. M. to Participate in the Privilege—Two Important Treasury Department Decisions.

In exporting automobiles the manufacturers are entitled to "drawbacks" or returns of the duty collected on such imported parts and materials as are incorporated in the machine and on which duty was paid at the time of their original importation, and in this they are receiving the active cooperation and help of the Treasury Department. Two decisions have just been given by the Department extending the list of those who are to be recognized as enjoying the drawback privilege.

Of these the more important insures the benefits of the drawback arrangement to all members of the Association of Licensed Automobile Manufacturers. The drawback, however, is limited to parts and material actually used in the construction of the cars themselves, and does not extend to external accessories or attachments. The instructions to the customs officers from the Treasury Department extend the regulations providing for the allowance of drawbacks so that they will "cover the exportation of automobiles manufactured by the members of the Association of Licensed Automobile Manufacturers with the use of imported parts. No drawback is to be allowed on horns, lamps, odometers and other attachments which may be readily detached from the automobile, and which do not form a permanent part thereof."

Denver Develops a New Wheel.

Embodying a pneumatic hub suspension with a solid rubber tire in contact with the ground, a new automobile wheel has been developed in Denver, Colo., for which the originators are confident there will be a big market. Sheriff Alexander Nisbet, T. W. Baird and Edward Dettlebach are backing the enterprise, Dettlebach being the inventor. Nisbet starts East very shortly to demonstrate the wheel and arrange for its manufacture in large quantities.

Overland Agency in the Metropolis.

Overland and Marion cars will hereafter be handled in New York City from a new location. The Metropolitan sale of the two lines has been placed with the Marion-Overland Automobile Company, which concern has its headquarters lower downtown than formerly, at 1657 Broadway.

Pope Company Retires Series of Notes.

C. H. Martin recently returned from Porto Rico where he established an automobile transportation line, has joined the forces of the White Company, in New York. He will have charge of the used vehicle department.

Digitized by Google

In the Retail World.

The Woodward Carriage Co., of San Antonio, Tex., has taken up the automobile business. The concern will handle the Rambler.

J. W. Davis, of Prophetstown, Ill., is establishing an automobile salesroom. He has leased the Trautwine building for the purpose.

D. A. Kelly, a blacksmith, is building an automobile garage and repair shop in Monticello, Ill. He will cater to the town's 20 machines.

The Allen-Swan Motor Co., of Brooklyn, N. Y., has changed its place of business. The company has taken a location at 1384-6 Bedford avenue.

The Auto Motor Co., of Boston, Mass., has taken a salesroom at 11 and 12 Park square. George H. Lowe will be with the company and expects to handle the Gyroscope.

The Sweeney Auto Livery Co., of Cleveland, O., has filed a deed of assignment in the insolvency court. Peter D. Quigley is named as assignee. The assets are placed at $1,500 and the liabilities at $3,500.

The Stanley Steamer Co., of Chicago, Ill., has accepted plans for a building which is to be erected for it at the southeast corner of Indiana avenue and Twenty-first street. The structure will be two stories high, costing $18,000.

J. W. Leavitt & Co., of San Francisco, Cal., have arranged for new quarters. They have leased a two story brick building at the southwest corner of Golden Gate avenue and Hyde street, which they will occupy at an early date.

The Star Automobile Co., of Wichita, Kan., has been organized, to handle the Overland. Temporary quarters have been obtained at 137 Market street, but the company has accepted plans for a $16,000 stone garage of its own which is to be built the coming year.

Suit against the Sid Black Automobile Co., of Cincinnati, O., and against Sidney Black and C. J. Neare, has been brought by the owners of the property occupied by the company. A lien is claimed upon $1,225 due for rent since last July. A receiver is also asked for.

The Bennett Auto Co. and the Bennett Auto Supply Co. have opened for business in Sioux City, Ia., at 313-315 Nebraska street. Both companies are owned by the same people, but the former will do a retail agency business in cars, while the latter will undertake a jobbing business in parts and supplies.

The Warner Motor Co., of Washington, D. C., has built a spacious new brick garage at 1204-1212 New Hampshire avenue, N. W., facing M street. The building has a frontage of 60 feet and is two stories high. Each floor yields 10,000 square feet and the second story contains a completely equipped machine and repair shop.

The new brick garage of the Tennessee Auto Co., 1308-12 Broadway, Nashville, Tenn., was formally opened on the 16th inst. The structure contains 15,000 square feet of floor space, has glazed front and rear and glass-sided roof. The Tennessee Auto Co. are agents for the E-M-F. cars.

The Marion-Overland Automobile Co., of New York City, by petition to the Supreme Court of New York, and an order therefrom, will legally change its name to the Overland Company of New York on January 7. There will be no change in the stockholders or officials of the corporation.

H. K. Sheridan, noted as a driver of White cars on various important reliability and endurance contests for a number of years, has been appointed superintendent fo the garage and repair shop of the New York City branch of the White Co.. Heretofore he has been located at the Cleveland factory.

Eleazer J. Goodby and Charles Marshall, employes of the Corbin Motor Vehicle Corporation, have formed a partnership to start in the automobile business in New Britain, Conn. They will do special body building and general repair work and have secured a shop in a brick building on West Main street.

The Hearsey-Willis Co., West Market street, Indianapolis, Ind., is closing out its carriage business and in future will devote itself exclusively to the automobile and bicycle trades. Three floors will be given over to the new lines among which is the recently added agency for the Waverley electrics.

The Goodyear Tire & Rubber Co.'s branch in Boston has had to move, its old building being torn down to make room for a new, five-story structure which will later be its home. Temporary accommodations have been taken at 669 Boylston street, until the permanent quarters at 261 Dartmouth street are ready next May.

The Week's Incorporations.

Massillon, O.—Jewel Motor Car Co., under Ohio laws, with $250,000 capital.

Lenox, Ia.—S. W. Wainwright Automobile and Supply Co., under Iowa laws. Capital, $10,000.

Chicago, Ill.—James Motor Express Co., under Illinois laws. Increase of capital from $16,000 to $34,000.

South Berwick, Me.—Taxi Associates, under Maine laws, with $200,000 capital. Corporators—E. Burleigh Davidson et al.

Chicago, Ill.—Stanley Motor Carriage Co., under Massachusetts laws, with $9,500 capital. Corporators—F. Jay, Chicago, et al.

Cincinnati, O.—Merchants Automobile Company, under Ohio laws, with $10,000 capital. Corporators—Edward Stang et al.

Belleville, Ill.—Model Automobile & Garage Co., under Illinois laws, with $2,000 capital. Corporators—I. H. Wangelin, Joseph Schwarz and E. L. Schwarz.

Oklahoma City, Okla.—Overland Automobile Sales Co., under Oklahoma laws, with $10,000 capital. Corporators—Will G. Brown, T. B. Funk and Alta E. Funk.

Memphis, Tenn.—Memphis Tax-Cab Co., under Tennessee laws, with $25,000 capital. Corporators—Frank Farrell, R. H. Allen, W. D. Watson, N. J. Sawrie and S. C. Childress.

St. Paul, Minn.—Pence Automobile Co., under Minnesota laws, increase of capital from $25,000 to $250,000. Officers—Henry E. Pence, president; Fred C. Malcolmson, secretary.

Brownsville, Tex.—Brownsville Motor Car and Machinery Co., under Texas laws, with $5,000 capital. Corporators—W. H. Mason, Jr., A. G. Mason, L. H. Mallam and C. Everson.

Berea, O.—Empire Auto Specialty Manufacturing Co., under Ohio laws, with $10,000 capital. Corporators—Hitt C. Gunther, E. C. Rush, L. C. Loomis, F. R. Pfeiffer and W. K. Caldwell.

Fond du Lac, Wis.—Worthing-Clark Auto Co., under Wisconsin laws, with $20,000 capital. Corporators—G. W. Worthing, E. W. Clark, J. W. Immel, A. Hoenigstin and George H. Stanchfield.

Oklahoma City, Okla.—Corey Motor Car Co., The, under Oklahoma laws, with $25,000 capital. Corporators—G. P. Corey, V. E. Crouch, W. P. Peck, Oklahoma City; C. D. Crouch, Bravo, Mich.

New York City, N. Y.—P. & H. Taxi Co., under New York laws, with $5,000 capital. Corporators—Elek J. Ludvigh, 299 Broadway; Arthur Present, 596 Broadway; Edwin C. Hyman, 820 Broadway.

New York City—Moto Bloc Import Co., under New York laws, with $5,000 capital; to deal in and rent automobiles. Corporators—H. M. Browne, F. W. Mills, E. J. Forhan, 154 Nassau street, New York.

Cambridge, Mass.—Auto Wind Shield Co., under Massachusetts laws, with $2,000 capital. Corporators—Frank Thorsen, Cambridge, president; Herbert H. White, Brookline, treasurer; and Thomas S. Longridge.

Newark, N. J.—Manhattan & Essex Auto Express Co., under New Jersey laws, with $100,000 capital. Corporators—O. W. Jackson, G. J. Motzenbecker, G. M. Hammell, Newark; V. S. Richardson, East Orange.

Asbury Park, N. J.—Royal Gray Motor Car Co., under New Jersey laws, with $50,000 capital; to carry passengers and goods for hire. Corporators—L. F. Groce, M. F. Groce, Asbury Park; W. H. Skinner, Lakewood.

Jersey City, N. J.—Cable Pneumatic Tire Co., under New Jersey laws, with $500,000 capital; to manufacture tires and accessories. Corporators—John F. Scannel, 729 Sixth avenue, New York; Frank A. Magowan, 241 Broadway, New York; Grant Lambright, Newark, N. J.

FEELING THE PULSE OF THE TRADE

Are the Retail Dealers Making Any Money? —What the Jobbers Say in Reply to the Question.

Taking a survey of the country, from coast to coast, are the automobile dealers, garage proprietors and the sellers of accessories at retail making money? The query has been put quite frequently by tradesmen whose plans more or less depend upon the stability of these elements of the business. No one is in a better position to know than are the jobbers who sell them goods and are in constant contact with them. As the "bankers of the supply trade", the jobbers are very much concerned for the welfare of the dealers, since the jobbing business reflects the conditions of the retail business with exactitude.

What the jobbers say about whether the dealers are prospering or not is authoritative. Conditions differ in various parts of the country, as may be gleaned by the following expressions of opinion by prominent jobbers which the Motor World has elicited in taking a census of their views on the subject.

New York City—"Business in general is in better condition to-day than ever it has been. The car dealer and garage man who is paying strict attention to business has made money this year, and always will make it. Collections are all that could be desired."

Los Angeles, Cal.—"Dealers in Southern California have passed through a fairly successful season. We believe that as a rule they have made some headway. They have undoubtedly done better than they anticipated owing to the crisis through which the country passed in the early part of the year, their sales being much larger than had been expected. Collections have not been easy to make and the jobber has worked under great hardships in carrying from month to month many of the dealers who were unable to meet their obligations."

Philadelphia, Pa.—"Business has been considerably better than we had reason to expect at the beginning of the year. Our business has almost reached the same proportion as last year, which was the largest in our experience. The outlook for the future seems very good at the present time, but collections are hard to make."

Denver, Colo.—"Business in this territory has been rather quiet for the last three months. Collections are fairly good, but considerable care has to be taken with credits, especially at this season of the year. Weather conditions have been somewhat against good business in the automobile line."

Hartford, Conn.—"Conditions among the trade in this territory are prosperous. Our losses on bad accounts have never been less than they have been this season, and everything looks most excellent for a good season for 1909."

Louisville, Ky.—"As far as Kentucky is concerned, notwithstanding the financial condition, the automobile business has been better in 1908 than in any previous year, and from present indications, 1909 business will exceed all former years. Believe most dealers can show a balance on the right side of the ledger."

Portland, Ore.—"Our total business for the year 1908 was about 15 per cent. greater than for 1907. This we believe can be reported of very few lines of business. Collections, however, have not been so good as last year, it being very difficult to collect from a great many of the garages in this section. We think this is due, however, to the fact that they have gone into the business with insufficient capital. The prospects for next year are very bright, and we anticipate an increase of our business to a considerable extent, though from the present outlook it is doubtful whether we will increase our net profits, owing to the fact that too many dealers are being quoted jobbers' prices by manufacturers."

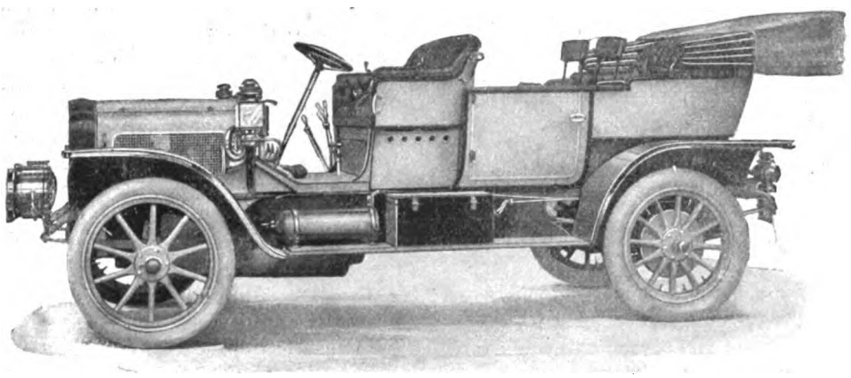
Boston, Mass.—"Volume of business done by the automobile trade in New England the past season has been greater than we a year ago expected it would be. While we question whether the dealers have made a great deal of money, still we think those representing standard vehicles have done fairly well, particularly in the lower and medium grades. We are inclined to think that those representing the highest grades have not made a whole lot of money. The general business in automobiles and automobile supplies is in much better shape at this time, however, than we were warranted a year ago in expecting. The principal trouble has been in the slowness of collections and the difficulty of making them."

St. Louis, Mo.—"We have every reason to believe that the dealers in this vicinity have a largely increased business over previous years, notwithstanding the late financial distress. In fact, our jobbing business alone shows a 50 per cent. increase over the same period last year—far more than we hoped for. Naturally we look for a very heavy business in the spring of 1909 which will be continuous through the season."

Rochester, N. Y.—"Altogether we believe we have experienced better business than we anticipated during such a business crisis as we have passed through. This crisis, however, has not improved the credit of the dealers, according to our experience. We find that collections are harder to make. We do not think the dealers have made much money."

New Orleans, La.—"Of course the fall of 1907 and the spring and summer of 1908 were nothing to be compared with what we reasonably should have expected under normal conditions. Still we feel that the business done during that period, taking into consideration the financial conditions which existed at this time, was as much as could be expected. The dealers in this territory seem to be doing nicely and holding their own. There are of course exceptions to the rule. It is our opinion that the automobile business is in better condition to-day as a whole than it has ever been since its incipiency. The dealers who are now engaged in the business are, as a rule, more experienced, have more capital and are working along more conservative lines than they ever have before. The next few years are sure to weed out the weaker dealers and manufacturers, and those who remain will naturally grow and prosper in exact ratio to the amount of energy, brains and straightforwardness with which they approach the various problems which will arise from time to time."

Minneapolis, Minn.—"The established dealers are making money and their credits average better. There is always a class of dealers and repair men who spring up and do business for a short time whose responsibility is doubtful. There are as many of this class this season as there have been heretofore."



Chicago, Ill.—"The past year has been considerably better than the year previous and conditions look very bright for a very large business the coming year. The dealers in this vicinity generally have made money, but some of the smaller ones have found it unprofitable."

Indianapolis, Ind.—"The trade outlook is, indeed, a satisfactory one. Trade conditions have greatly improved over the past year, especially in the central territory and the dealers throughout the country are studying the automobile situation from a more business-like basis, and are realizing the requirements for a first-class garage and automobile agency. Capital is interesting itself more conservatively in the sale of cars and 1909 will undoubtedly be a successful year from the dealers' standpoint as well as the manufacturers' standpoint."

New York City—"A little over a year ago when the panic struck us a few automobile manufacturers fell by the wayside and everyone predicted that the whole industry would have hard sledding in 1908. The wise ones said that automobiles, being luxuries, could and would be done without; but, strange to say, the opposite has happened. Good cars sold well, and I am satisfied that most supply dealers increased their trade too. Our business in this department has shown a large increase in volume, and the profits have been satisfactory as a whole. I think that the experienced dealers have made money this year, but so many 'fly-by-nights' have been attracted to this trade by visions of big profits that credits have not been good. While the business is very much alive, I don't look for a runaway market in 1909. I mean by that that the sale of automobiles and automobile accessories should increase and probably will, but the supply will equal the demand and caution should be used."

THE
MODEL "M" WHITE STEAMER
Is The Most Luxurious Car On The Market

The luxury of the White Steamer is unequalled by any other machine. There is no car, however expensive, which has better upholstery, better springs or better finish. Owing to the compactness of the mechanism, the body is much more commodious than in any car of similar wheelbase, (122 inches). Few other makes have such a liberal tire equipment (36x4 on the front wheels and 36x5 on the rear wheels.)

The luxury of any car, however, depends largely upon its riding qualities and here the White is "in a class by itself." It is the only car where starting and changes of speed can be effected without jerks or jolts. It is the only car which runs noiselessly under all conditions. It is the only car which is free from vibration, because it is the only car where the power is applied evenly and continuously, and not spasmodically.

Just as our Model "M," priced at $4,000, is the most desirable of the higher-priced cars, so our Model "O," at $2,000 predominates among moderate priced machines.

Write for descriptive matter.

Cable Address, "MOTORWORLD," NEW YORK.

Entered as second-class matter at the New York Post Office, November, 1900.

NEW YORK, DECEMBER 31, 1908.

". . . . By the way, I like the Motor World. It gives the kind of stuff the dealer wants to know, and you ought to hold your own long after the general public stops reading automobile papers."
NEW YORK SPORTING GOODS CO.,
James E. Murray, Secretary

The Palace Show Number of the Motor World will, of course, bear the date of January 7th. The dates of the Garden Show Numbers will be January 14th and 21st, respectively.

The Outlook for the New Year.

In connection with the simple process of turning down another leaf in the history of New York's great automobile shows, this important fact should be jotted down with care. The first of the shows of 1909 and the last of 1908 also is the first to be held since the industry at large passed through the fire of a great financial upheaval and emerged practicaly unscathed.

That at the time of the last exhibition of its kind in Grand Central Palace it was freely predicted that before another year should have rolled by the industry would have suffered the severest test to which it could be put, is yet fresh in memory. How it was said that automobiles, as luxuries, would be among the first of the commodities to be slighted when conditions of money stringency began to become at all general, and how the apparent prosperity of the industry was decried as being a false index to its real condition, which was one of instability, is easily recalled. But how the industry should have passed through the ordeal without serious affliction and resumed its way with practical unconcern, still is more or less of a marvel.

With the opening of the doors of the Palace, however, a somewhat chastened if not afflicted industry will welcome the public. The lessons of the period of threatened downfall have been well learned, and it is unquestionable that more conservative methods of conduct now rule the business side of the industry than formerly were in vogue. As for the product itself, it cannot be gainsaid that the rapid rise of the medium priced car, built to cater to a real requirement among classes of buyers numerically very great, has been influenced very largely by the alarm of the panic time.

That the industry as a whole is greatly benefited, therefore, is beyond question, since it has learned not simply the advantages of cautious operation in money matters, but of developing the quantity market or a quality basis. There is less of the speculative element manifest to-day perhaps, than ever before during its short term of existence. This being so, the industry is in a fair way to continue its upbuilding for the future. Generally speaking, the twelve-month just closing proved a far better one than even the most optimistic had reason to anticipate, and the augury is particularly happy for an even more prosperous new year.

Winter Motoring and the Small Car.

In arraying small cars and large cars comparatively in the matter of sales, the latter appear at their best during the winter months, according to the dealers in the big cities. This is because commodious, high powered touring cars and limousines are enjoying a more extensive winter use each year, so that the prospective purchasers of these types are just as eager for their machines in November or January as in May. To secure satisfactory delivery in the spring, many buyers of certain favored small cars are obliged to place their orders early in the winter, having in mind the time that will elapse between the filing of the order and the appearance of the car. But the actual arrival of the warm months is what moves the great proportion of runabout and small car enthusiasts to the maximum of their buying.

The change in the users' attitude toward the big cars, by which these machines are now regarded as part of winter life in the city instead of being shut in store rooms to await a brief season of use in the summer, will, almost without doubt, be extended to the smaller cars as well. Even the owner who required the presence of spring weather to stir his blood to the point where he paid over his money for a runabout or light car will find himself reluctant to give up the use of his machine in the fall and winter, and, supported by growing custom, he will come to use it the year through.

Many devices in the way of clever windshields, heating arrangements and the like have been made available to the winter motorist, yielding a degree of protection and comfort that should easily swing the beam toward all-the-year-'round enjoyment of motor car transportation. Inventive minds have also devised methods of relieving drivers from all need of worry as to winter "skidding" dangers. It is therefore easy to see why those who have used their cars for one winter are ready to do it again the next. While it is perhaps too much to expect that first-time automobile purchasers will abandon their preference for spring delivery, yet as the people who have had cars before come into the market for their second, third or fourth cars in increasing numbers, it will be found that the sale and delivery of machines will be spread out more evenly through the different months, rather than being bunched in the early part of the year as at present. Veteran owners and, in frequent instances, novice purchasers of the big cars already recognize that the automobile is for every month, and the smaller cars will before long win the same recognition.

International Patent Law Assailed.

Whatever favorable results may come of the projected "patent treaty" with Germany so far as obtaining for American inventors a more liberal dispensation of the

Digitized by Google

German patent office practice, it is to be hoped that on this side of the water the patent system be kept free from entanglements and agreements contrary to the spirit of absolute impartiality which is imposed upon it by the Constitution. It is somewhat old fashioned but none the less sound to refer to the Constitutional sources of governmental institutions.

Patent protection for new and useful inventions, whether conceived by foreign or native mind, is designated by the Constitution as a "right" and not a mere privilege. However expedient it might at times appear to retaliate against a foreign country's ill treatment of Americans, or to attempt a grateful reward for concessions, no discriminations can properly be exercised by the United States Patent Office in its dealings with foreign inventors no matter where they may reside or from what part of the world they make their applications. For this reason the Patent Office should be saved from diplomatic influences and bargaining.

With the advent of the taximeter appliance in motor vehicle service has come the old, familiar worry of the patron as to whether the instrument is being honestly used, or whether it may not be designed to trick him out of a few pennies now and then. The suspicion that the driver may be turning more corners to the left than to the right, or that he may spend his waiting moments in running the motor with one wheel jacked off the ground, is nothing as compared with the horrible doubt as to the integrity of the proprietor himself. But after all, it is merely the old story of the gas meter and the computing scales. After a time, the public will have become adjusted to the new condition, a few necessary laws will have been enacted, and taximeters will cease to annoy and will fit into a very unobtrusive though important nitch.

Having obtained a donation of $5,000 from the National Association of Automobile Manufacturers to relieve its immediate necessities, it is understood that the American Automobile Association is making ready to ask manufacturers generally to support an official organ, the publication of which practically has been decided on. The publisher who already seeks the favor of the trade with four or five other mediums is said to be "the man behind the scene" of the embryo official organ.

CARS AS "HOUSEHOLD EFFECTS"

Appraisers' Decision Denies Such Status to Foreign Automobiles Brought Home by Tourists—Reasons Stated.

Foreign cars brought over as "household effects" by a "person from a foreign country" are not to be admitted without paying the 45 per cent. duty imposed by the tariff when the "person" is a resident of the United States, according to a ruling just handed down by the Board of General Appraisers at New York. The law provides for an exemption from the duty on bona-fide household effects that have been used abroad for not less than a year by persons or families from other countries who come to the United States, but the Appraisers take the view that an American returning from a comparatively brief trip abroad is not a person from a foreign country in the sense contemplated.

A protest was filed against the assessment of duty on a machine belonging to Paul A. Isler, it being claimed that the car was entitled to free admission as household effects under paragraph 504 of the tariff act of 1897. In passing upon the case the Board of Appraisers gave the results of their findings as follows:

"It appears from the evidence that the protestant is a resident of the United States; that he purchased the automobile while on a visit abroad, about two years prior to its importation to this country; that it was used abroad by him during his visit about four months at that time, and on other visits prior to its importation.

. . .

"Since the decision in Arthur v. Morgan (112U. S., 495) and Hillhouse v. United States (152 Fed. Rep., 163; T. D. 27831), there is not question that an automobile is a household effect within the meaning of this phrase as used in paragraph 504. We are inclined to think that the use of the automobile was practically continuous for more than a year. It can scarcely be that the requirements of this paragraph are so narrow that the household effects in question must have been in actual physical use every day or every week or every month of the year preceding importation. The question about which we think there is grave doubt is whether the protestant is, under the circumstances of the case, in a position to claim the benefit of free entry. . . .

"A citizen and resident of the United States going abroad on a few months' pleasure trip and returning is not, in our judgment, a person from a foreign country within the meaning of that phrase as used in this paragraph of the law. The benefit of this was, in our judgment, intended by Congress to accrue only to citizens of a foreign country or citizens of this country who remain in a foreign country at least long enough to acquire a temporary residence there. A citizen of the United States who is a mere traveler to and from Europe, without ever remaining there more than a few months, has not acquired such status as to be entitled to the exemption provided by paragraph 504."

COMING EVENTS

December 31-January 7, New York City—American Motor Car Manufacturers' Association's annual show in Grand Central Palace.

January 1-2—Quaker City Motor Club's two days endurance run, Philadelphia to Wilkes-Barre, Pa., and return.

January 16-23, New York City—Association of Licensed Automobile Manufacturers' annual show, Madison Square Garden.

January 21-31, Los Angeles, Cal.—Automobile Dealers Association's show.

January 25-30, Cincinnati, O.—Automobile Dealers Association's show.

January 27-February 3, Philadelphia, Pa.—Automobile Trade Association's eighth annual show, Second Regiment armory.

February 6-15. Chicago. Ill.—National Association of Automobile Manufacturers' Show, Coliseum and First Regiment Armory.

February 15, Detroit, Mich.—Detroit Automobile Dealers Association's show, Wayne Pavilion.

February 15-20, St. Louis, Mo.—Automobile Manufacturers and Dealers Association's annual show.

February 15-20, Cleveland, O.—Automobile show, Central Armory.

February 16-18, Denver, Col.—Denver Motor Club's first annual show, Auditorium.

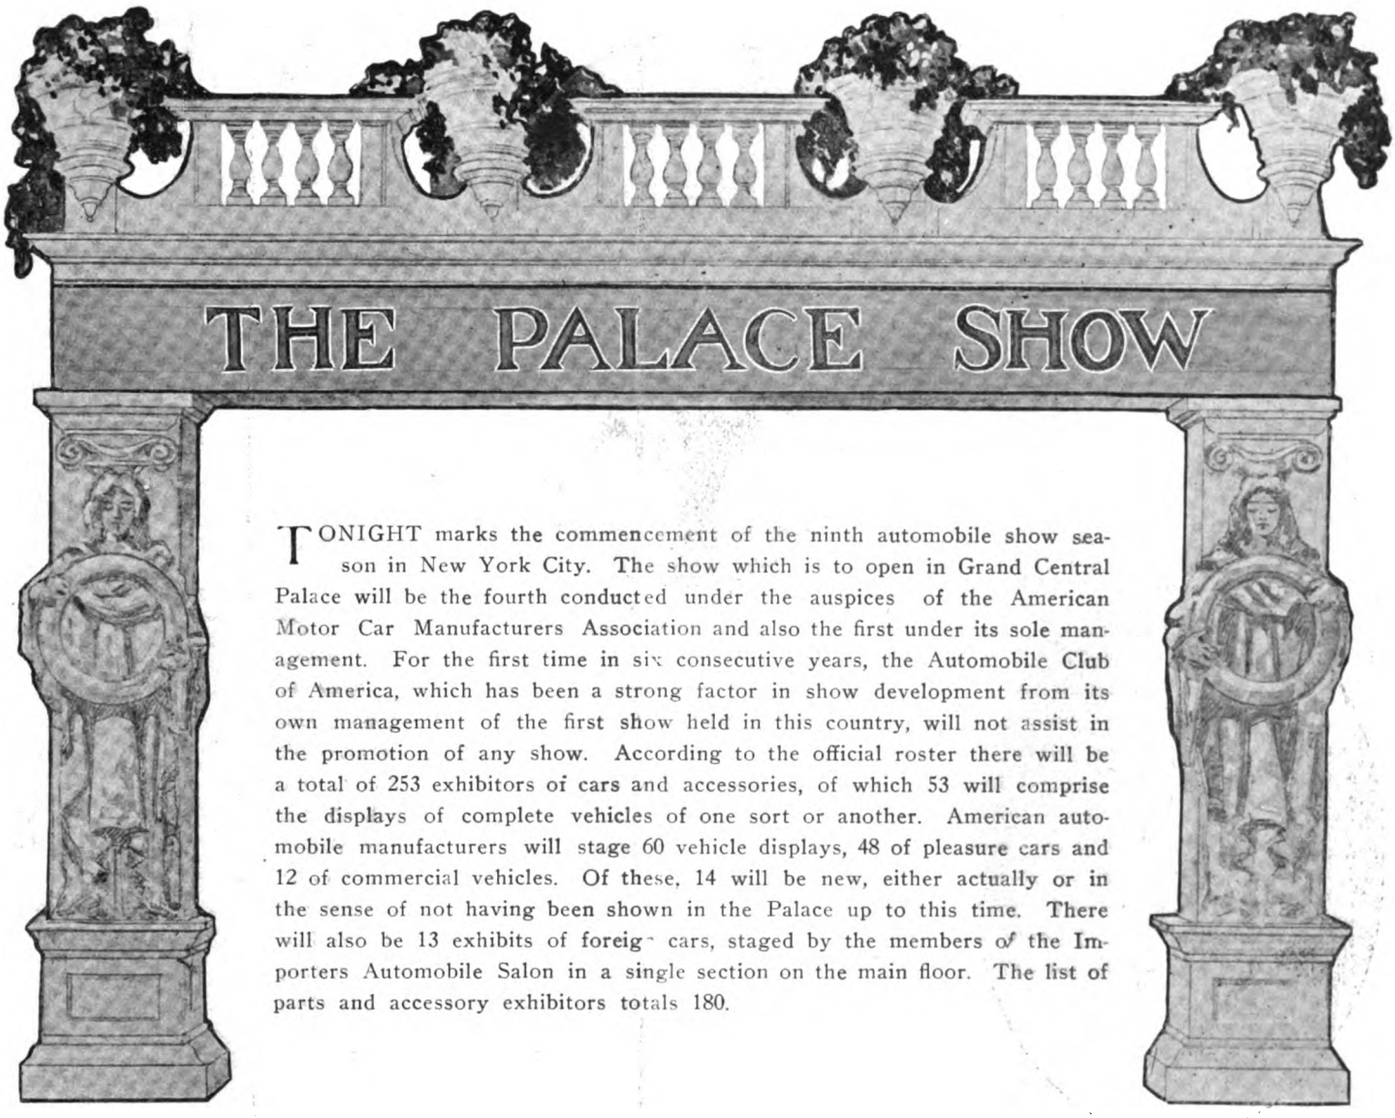
February 20, 21, 22, New Orleans, La.—New Orleans Automobile Club's Mardi Gras carnival 3 days race meet.

February 22, Cleveland, O.—Cleveland Automobile Dealers Company's show, Central Armory.

February 27-March 3, Hartford, Conn.—Automobile Dealers' Association show.

March 1-6, Omaha, Neb.—Omaha and Council Bluffs dealers' show, Auditorium.

March 6-13, Boston, Mass.—Boston Automobile Dealers Association's (Inc.) seventh annual show, Mechanics Building.



March 8-15, Kansas City, Mo.—Dealers Association's show, Convention Hall.

March 10-13, Memphis, Tenn.—Automobile show, Auditorium building.

March 15-20, Rochester, N. Y.—Rochester Automobile Dealers Association's show, Convention Hall.

March 27-April 3, Pittsburg, Pa.—Automobile Dealers Association's show, Duquesne Garden.

Digitized by Google

With prospects bright for a prosperous season to come and a prevalent feeling of security in the sentiment that the general adoption of the medium and low priced models which now rule the market to so great an extent is destined to react favorably on the industry, conditions are particularly favorable for the success of the show which is about to open its doors. That only a portion of the industry is to have representation in the present session, another large section planning to conduct a similar enterprise within a fortnight by no means implies any lack of comprehensiveness on the part of the undertaking of the American Motor Car Manufacturers' Association which is to hold the boards in the Grand Central Palace for the next seven days. Indeed, it is a happy circumstance of the process which has brought about the segregation of the so-called "Independent" and "Licensed" forces, that their lines have been drawn without regard to type, and that each of the two great shows will be complete in itself. Even so, the first, will offer in variety of types and divergency of designs and practices an unapproachable array of vehicles calculated to satisfy the requirements of every conceivable creed or denomination of buyer.

Nine years ago the first affair of its kind was convened in Madison Square Garden under the auspices of the Automobile Club of America. That the present show is the ninth in succession also, despite the fact that no show was held during the year 1902, is due to the fact that two shows were held in 1906, marking the transition back from the late to the early fall date. Last year's October dating, and the opening of the present season nearly two months later in the year, mark a second swing of the pendulum. While the first show was held in November, and early December shows have been seen on two other occasions, this is the fifth show to fall in some part of the month of January.

A significant feature of the present exhibition is the withdrawal of the Automobile Club of America from active participation in its affairs. Until last year that body had managed or participated in the management of a show each year. The first five of its undertakings were carried out within the precincts of Madison Square Garden. The formation of the A. M. C. M A., however, enabled it to establish the first independent show when, in 1906, the Association of Licensed Automobile Manufacturers first secured the Garden for its own use. With the silent support of the A. M. C. M. A. and the assistance of its members as exhibitors, the show was staged in the Sixty-ninth Regiment Armory. The following year adjournment was made to the Palace, which since has been the scene of one other exhibition conducted under the same joint auspices. This year, however, the management of the affair is entirely in the hands of the A. M. C. M. A., under whose persuasive guidance it has assumed greater proportions than ever before.

Although nominally placed in control of the show for the first time this year, Alfred Reeves, general manager of the association, Benjamin Briscoe, its chairman, and H. O. Smith, who is chairman of the show committee, actually had been deeply involved

Digitized by Google

in the work of perfecting the organization of the previous ventures.

Just what it means to stage and manage a big metropolitan exposition of this nature it is given to very few men to know. The immensity of the task and the amount of tedious detail to be handled carefully and critically are beyond the comprehension of the ordinary visitor—even of the exhibitor himself in many cases. It is worthy of note also, that the mere administration of the show during its life, is a very small portion of the work entailed in planning and organizing it. On this account, when the doors of the Palace open tonight, the committeemen will see the culmination of a prolonged effort lasting over more than nine months, and just as the tedium which awaits the exhibitor in his stall is beginning to take hold, the show management experiences a feeling of assurance and contentment unknown for many weeks, because the hardest portion of its task is now over.

BENJAMIN BRISCOE
Chairman of Committee of Management

The setting for the show is quite the most ostentatious yet assumed in the Palace. The exterior, with its bare portico of structural iron and glass, has been transformed into an ornamental portcochere, backed by a huge oil painting in deep-set frame, brilliantly illuminated at night, and alluring to the displays within. The uncouth walls of the entrance hall and stairway have been disguised with huge oil paintings depicting various conceptions of the grouping of feminine beauty with mechanical achievements in the shape of motors, ignition devices and accoutrements of various sorts. Heroic statues further grace the hall and point the way to the upper regions where the show is held.

In the main hall, and at the end ordinarily occupied by the stage, a garden has been laid out, the greenery surrounding but not concealing a further grouping of statuary. The early English style of treatment accorded the entire interior, though simple in detail, lends itself to the purpose it is destined to serve, which is that of forming merely an inconspicuous and harmonious background for the displays which constitute the real purpose of the scene.

H. O. SMITH
Chairman of Show Committee

Show Week Calendar.

Thursday, December 31.

Meeting of Show Committee A. M. C. M. A., 10 a. m.

Private view of Show to members of the press and invited guests, 3 p. m.

Meeting Executive Committee, New York Automobile Trade Association.

Formal opening of Show, 8 p. m.

Gala Night.

Friday, January 1.

Army and Navy Night.

Saturday, January 2.

Show Smoker to visiting motorists and dealers, at A. C. A. club house, 10.30 p. m.

Students' Night.

Monday, January 4.

Meeting Executive Committee, American Automobile Association, 2 p. m.

Engineers' Night.

Tuesday, January 5.

Meeting Executive Committee, National Retail Dealers Association, 10 a. m.

Show Luncheon to exhibitors, by A. M. C. M. A., Hotel Manhattan, 1 p. m.

Meeting Board of Governors, Automobile Club of America, 4 p. m.

Annual Meeting, Society of Automobile Engineers, morning and afternoon sessions, at A. C. A. club house; dinner, 8 p. m.

Society Night.

Wednesday, January 6.

Meeting Committee of Management, A. M. C. M. A., 10 a. m.

Meeting Board of Directors, Importers' Automobile Salon.

Executive Committee Meeting, Motor and Accessory Manufacturers.

Merchants' Night.

Thursday, January 7.

Executive Committee Meeting, American Motor League.

Municipal Night.

Aside from the decorations, several other innovations have been brought about. For example, the official opening at 8 o'clock to-night will be presided over by Acting Mayor Patrick F. McGowan, who in the absence of Mayor McClellan will make the address of welcome and formally turn the show over to the members of the trade and the visiting public. Although civic recognition of the importance of the shows has been courted repeatedly in the past, it never has been won until now. While this ceremony will directly affect the public as signifying the real opening of the exhibition, the private view of the show at 3 o'clock in the afternoon will be more auspicious than any of its predecessors. Over 3,000 invitations are said to have been sent out to persons qualified to attend the affair, these including judges, congressmen, senators and assemblymen of the State legislature, members of the Automobile Club of America and the officers of all automobile clubs affiliated with the American Automobile Association.

ALFRED REEVES
General Manager A. M. C. M. A.

Of the 253 separate exhibitors of complete vehicles, parts, accessories and sundries, which are revealed by the official list, no less than 73 will be either the manufacturers of complete cars of one sort or another, or their representatives. The American industry will have a contingent of 61 displays, 48 of them being pleasure vehicles and 12 commercial or business vehicles, while no less than 180 separate displays will be given over to the exhibitors of parts and accessories.

Failing the encouragement needed to support an independent show of their own, the members of the Importers' Automobile Salon have this year joined forces with the A. M. C. M. A., and taken over a liberal allotment of floor space for the staging of

Digitized by Google

the foreign product. Of importing exhibitors there will be a bakers' dozen, one of them figuring in the commercial vehicle section. In adition to the elaborate and high-powered types of pleasure vehicle which form their stock in trade, several of these stands also will be rendered more attractive to the visitor by the presence of a number of high-speed racing cars, which

GODDESS OF MOTORING

have figured more or less conspicuously in recent events.

Attention always turns immediately upon entering the show to the new cars exhibited for the first time. As is usually the case, some of these will be found to have been brought out some little time ago and to be

GENIUS OF THE MOTOR

entitled to the term "new" only from the fact that they have not been shown previously in New York. Others are of entirely new production and consequently are objects of general curiosity on every hand.

Included in the general class of new vehicles, as just indicated, will be found no

THE SPIRIT OF SPORT

less than fourteen. They are the Benner, Browniekar, Coates, Middleby, Midland, Regal, Inter-State, Speedwell, American Simplex, Bristol, Cleveland, Grabowsky, Gramm-Logan and Hart-Kraft. The Benner is a light, six-cylinder runabout of semi-racing lines, but destined for general runabout duty. The Browniekar is distinguished as the first and only gasolene-driven juvenile machine ever placed on the market—a real automobile in miniature, but designed along lines which are calculated to make it safe as well as active in the hands of fortunate youth.

The Middleby is an air-cooled machine, with 25-horsepower motor, weighing about 1,750 pounds, and selling for $850 in runa-

GODDESS OF MOTORING

bout form. It also is made with surry or convertible runabout body. The Midland is a larger and more pretentious vehicle, selling at $2,250 and featured as a particularly light weight machine, considering its power and equipment. The Regal is intermediate in cost between the last two named, is propelled by a 4-inch "square" engine, and is produced either in runabout or tour-

GENIUS OF THE MAGNETO

ing form. The Speedwell, though not before exhibited in New York, has been seen in the East before, and is well known in the Middle West. It is one of the many

MOON MODEL "C" TOURING CAR

INTER-STATE 35-40 H. P. TOURING CAR

ACME TYPE "20" SEXTUPLET

"completely equipped" cars, selling at a moderate figure, and possessing in addition to these inducements several structural details which are noteworthy.

Another of the newcomers, in this case a machine which never before has been exhibited in or out of New York, is the Inter-State. It is an unusually attractive offering of the medium-priced variety, but exceptional in that it is presented as a complete touring car or with a combination roadster, tourabout and demi-tonneau body—an innovation which is said to be of compelling ingenuity—at $1,750. When it is considered that it is driven by a 35-40 horsepower motor and is correspondingly robust in other particulars, the significance of the price quotation at once is made apparent.

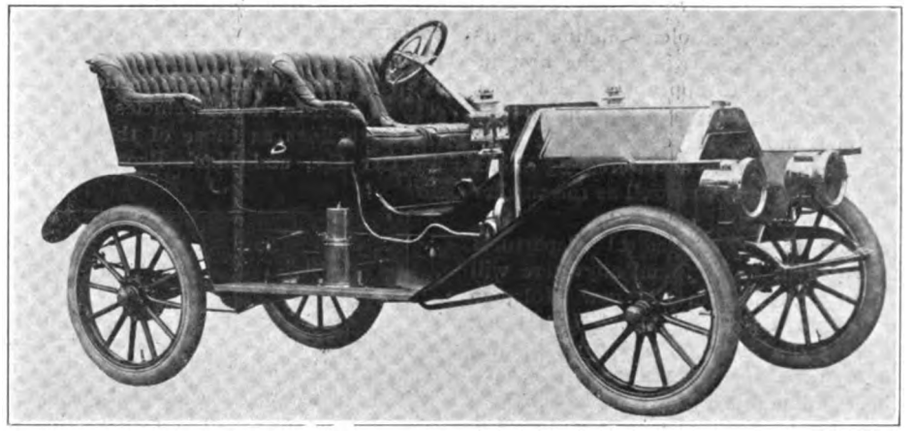
The Bristol and Cleveland are commercial vehicles of the cab variety, the former possessing a number of unique features in the way of provisions for interchanging of parts with small loss of time. The Grabowsky, and Gramm-Logan, both are commercial vehicles which are new and both are the product of constructors who have become established within the year. The Hart-Kraft also is intended for commercial uses, but is distinguished by the use of high wheels, an interchangeable power plant, and a number of other features intended to render it especially suitable for light delivery work.

Another newcomer at the show is the Oakland, which though exhibited at other shows last spring, never before has come to New York. In the older of the two models, is to be found an unique system of balancing, which is altogether unusual and which makes possible an almost total suppression of vibration. The motor is unusual and original in other respects as well, and the vehicle as a whole displays an astonishing number of novel features. A second and larger model which is absolutely new, is equipped with a four-cylinder 40 horsepower motor.

Among the machines, already familiar as to name, but not displayed in new models this year may be mentioned the Acme, which in the main, follows its prototypes, but is shown with an engine of increased bore, enlarged valves, a rearrangement of the braking system and a marked reduction in weight.

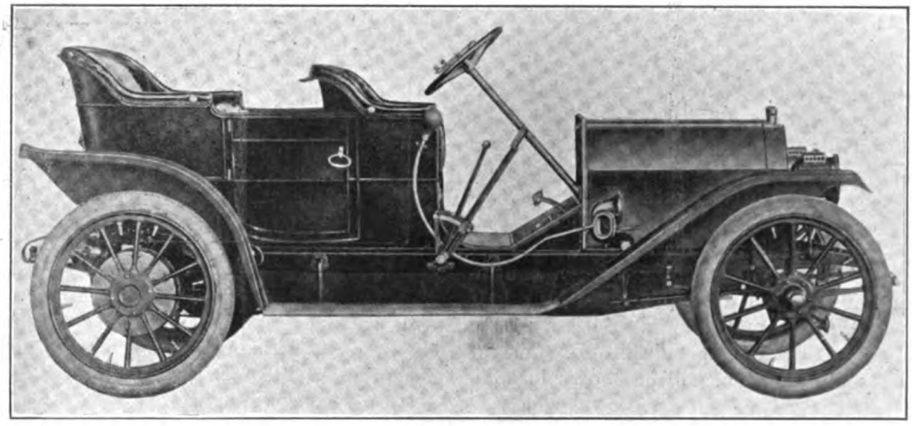
The Cartercar, whose makers have recently undergone a change of name and a change of location, is produced in a brand new form at an even $1,000. the vehicle carries the usual friction drive feature which is characteristic of all machines of the same make, and has an 18-20 horsepower motor of the opposed type, also typical of Cartercar construction. The machine is fitted with a roadster type of body having a removable rear seat, and carries a full equipment.

The latest types of the Ford, Marmon, Maxwell, Mitchell and Pullman cars have been described in these columns within a short time, as have also the Jackson and Stoddard-Dayton. The Overland, which attracted considerable attention a year ago from the fact of its having an original system of speed control by means of pedals and was minus the usual side levers, again appears in practically the same form, the unique method of mounting the planetary change gear on the rear axle being retained. It also is accompanied by a second and entirely new model which has a four-cylinder motor and selective system of gear change operated by side levers in the conventional manner. The new Premier model,



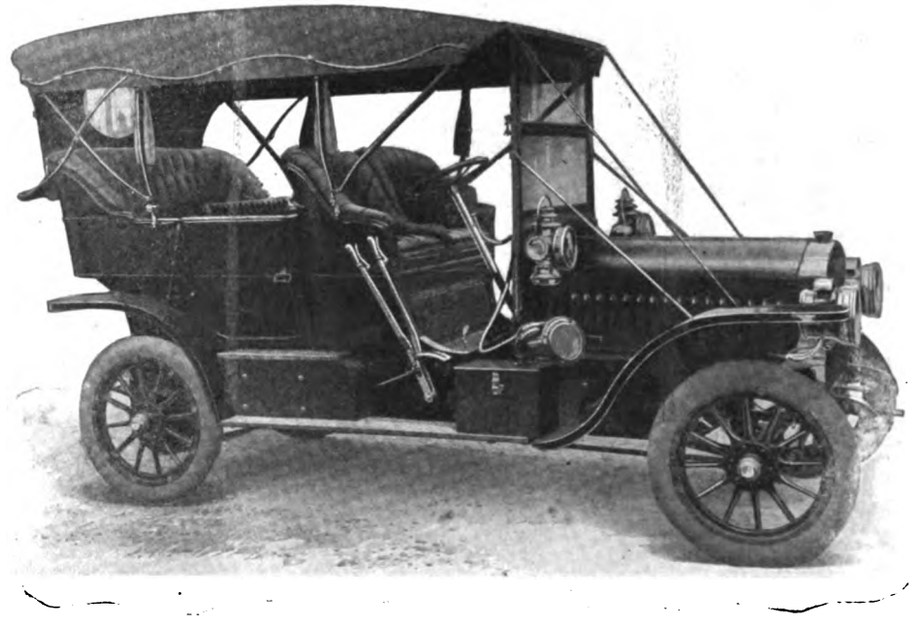
Digitized by Google

to cite another example of a recent addition to a well known line, is of 30 horsepower and in many respects is identical with the corresponding type of the current season. The body design is entirely new, however, and sundry minor refinements have involved alterations in the construction of the chassis.



Of the "features" of the complete vehicle section of the show, it is sufficient to say that the dominant characteristic is the relation of selling price to the special elements which are most emphasized in each instance. Thus the little Maxwell Junior which embodies practically all the characteristics which have become identified with Maxwell construction as applied to the larger models which carry opposed motors, is rendered even more attractive than its compact design and small size otherwise would entitle it to be by the fact that it is offered at the $500 figure, inclusive of equipment. In a similar way, the $800 Lambert, with its friction transmission enclosed, single chain drive, three-passenger rumble runabout body and 18 horsepower motor, is said to be a remarkable concession to the requirements of the buyer affording a high value at a very low figure.

A machine noteworthy in a different way, though still made more interesting by the relatively low cost of the vehicle, is the Oakland, with its unusual construction all the way through. From the steering gear, which is arranged to give a very slight variation of leverage over the steering wheels when turned into extreme lock, to the planetary transmission with disc clutch, and shaft drive, this car will be found to reveal the original touch of the absolutely independent designer.



Of the Model "T" Ford, which is the most recent product of Henry Ford's genius and which though on view in New York City for some weeks, has not before been displayed at an automobile show, it may be said that aside from all other structural points, the method of design and assemblage of the power plant is most remarkable. The scheme of embodying the magneto in the fly wheel of the motor where it is perfectly protected from dust and dirt, as from injury due to violence from external sources, is perhaps its most interesting feature. The use of the combined underpan, bottom section of the crank case, and engine bed, the part being made of pressed steel and also being stretched to the rear to form a portion of the housing for the change gear, also is sufficiently radical in itself to excite comment. The motor is cast in block form, but the cylinder heads are removable, and are formed integrally in a single, water jacketed piece which may be lifted clear of the motor at slight expense of time or labor, thus giving free admittance to the tops of the pistons and the upper portions of the cylinder walls for the purpose of effecting repairs or removing the ever troublesome carbon deposit, which with ordinary construction is so hard to get at.

OVERLAND MODEL "31"

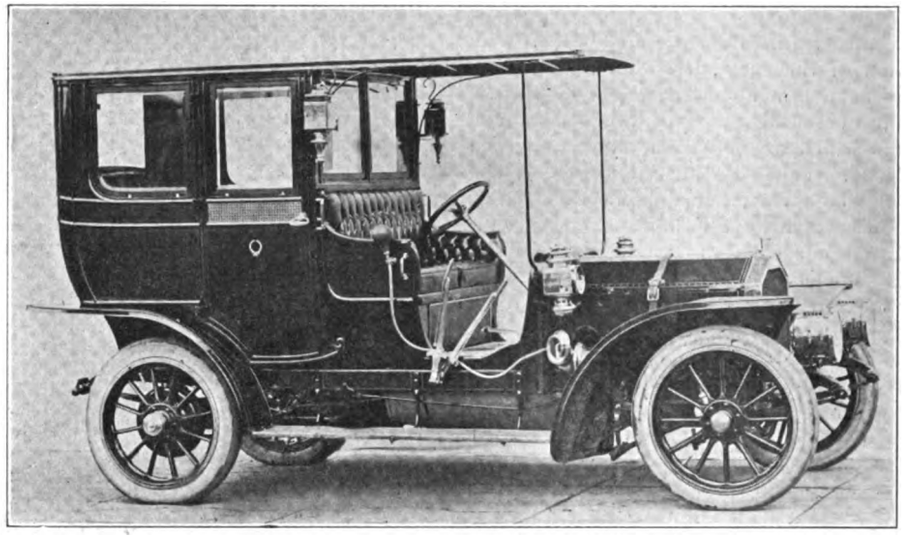
MARMON "THIRTY-TWO"

LAMBERT MODEL "B-2"

In respect to the single element of interchangeability of the power plant, the three commercial types of Bristol, Grabowsky and Hart-Kraft, already mentioned, are entitled to attention, is in each of the three cases special provision has been made for the ready removal of the complete power plant, motor, change gear and all, and its replacement after repairs have been effected, or the substitution of another, similar unit, and all with a minimum of effort and time loss.

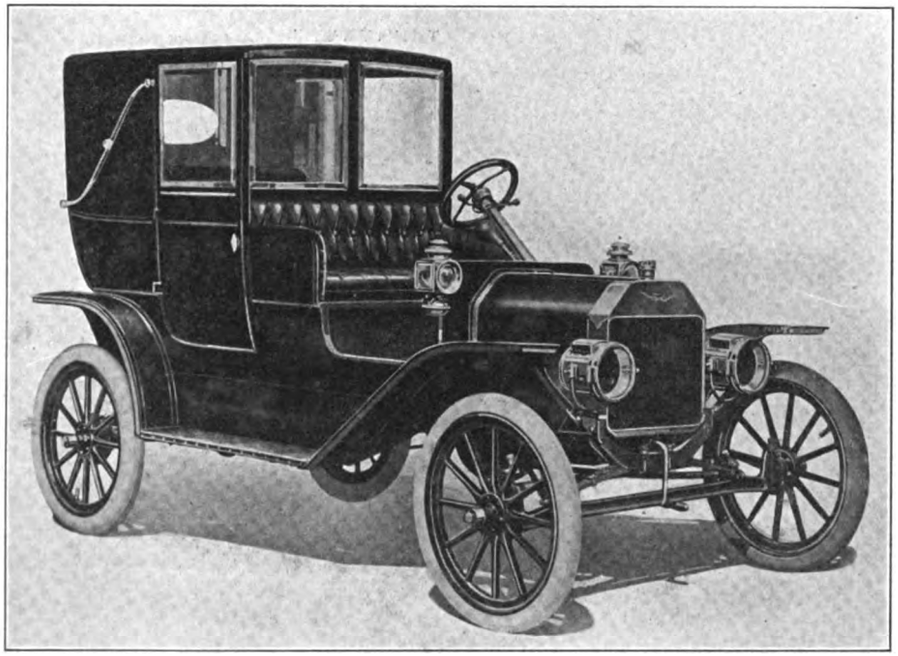
The "toy" automobile referred to above though the first machine of its kind to be

Digitized by Google



built using a tiny gasolene engine as its source of motor power, is not the first juvenile automobile to appear in the Palace, a tiny electric vehicle having been on view at the last show. Its construction, however, is likely to prove an interesting object for study to the larger as well as the smaller fry.

Probably the most radical departures from precedent to be found anywhere will be those embodied in the new Holsman "Gentleman's Carriage," which is making its bow to the automobile show-ging public at this time. Its motor, which is mounted throughout on annular ball bearings, is unusual in design to the extent of having a substitute linkage in place of the ordinary connecting rod and crank shaft construction, somewhat similar in principle to the Scotch yoke of other lines of engineering practice. The motor is of the four-cylinder opposed type, air-cooled, compacted into an astonishingly small amount of space and mounted on the jack shaft housing, which is moved toward the front or back of the carriage in order to adjust the tension on the driving cables—which are a well known Holsman feature.



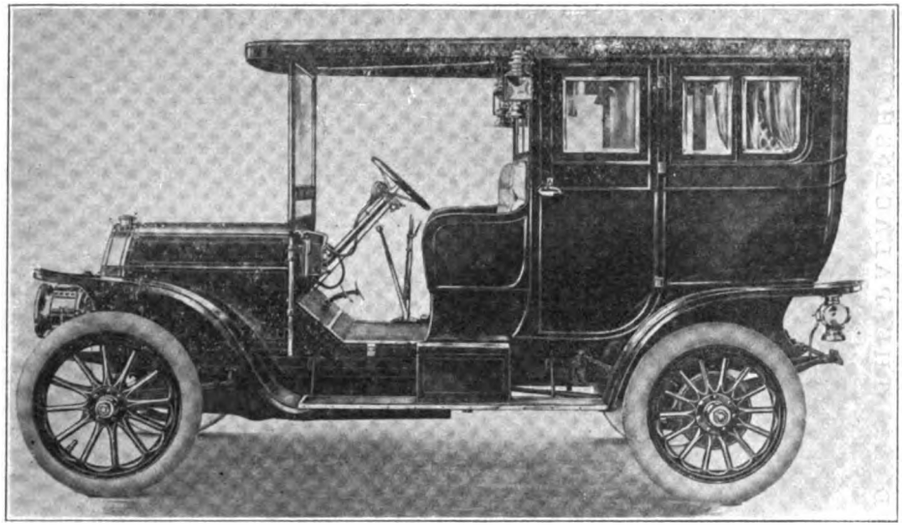
The high-wheeled motor buggy contingent this year will be represented by a half doxen different makers. In addition to the Holsman, the Kiblinger, Chicago, Schacht and Reliable-Dayton, will be shown in addition to the Hart-Kraft commercial vericle already referred to. That the latter may not stand alone, the Reliable-Dayton stand also will be graced with a commercial or delivery wagon never before shown at a New York show, though it made its appearance along with a number of other cars to be represented at the Palace when the National Carriage Dealers Protective Association held its vehicle show last fall in the same building.

The purely commercial section will display in addition to the vehicles named, such extensive lines as those of the Rapid Motor Car Co., and Mack Bros. Here also will be found the small representation of electric vehicle construction with a single exception in the Detroit Electric, which is staged also n the balcony. Those of the commercial vehicles which are electrically propelled are the Commercial trucks, the Pittsburg delivery wagons, light and heavy, and the Lansden ffuartet of vehicles, light and heavy, but all designed for commercial purposes.

"Tendencies" or "trends" in designs and construction are of far less interest to the show-goer this year than ever before because of the high degree of interchangeability which has been achieved by so many makers, itself tending to discourage any alterations in design except such as may be absolutely necessary or of minor significance, and because of the uniformity of the various products in so many respects. Nevertheless in the general adoption of certain standard types of vehicle, in the installation of certain important accessories and fittings, sufficient inclination among the makers to flock together is discoverable, to furnish ample opportunity for the thoughtful visitor to pursue his accustomed show avocation of studying the general movements of the mechanical side of the industry.

PULLMAN MODEL "M" LIMOUSINE

FORD TAXICAB



By way of characterization, it is sufficient to say that the Palace Show will reveal in astonishing proportions, the effect of the movement of the year which, beyond all question has been the development of the medium priced car. Besides, there will be the ever-growing display of closed vehicles, which, whether designated openly as taximeter cabs, or whether planned for the more ostentatious use of the calling and shopping town car, form a distinct and interesting class, and quite as much an indication of industrial trend as is witnessed in the low and medium priced touring car and runabout.

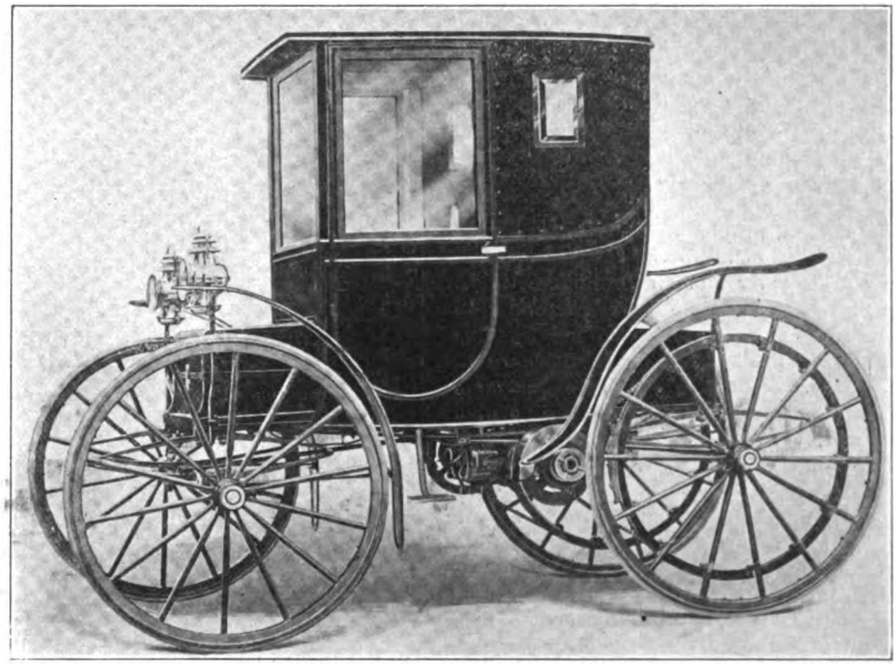
In body design, this same short, handy town car, with its close coupled chassis, will be found in many styles, and may be considered a feature of the show. Wheels larger than ever will be seen on every hand. On the heavier vehicles the 36-inch wheel has become practically standard, while 40 inches of wheel diameter on the American does not look as ungainly as did the 36-inch wheels of a few years ago. Tires have been silghtly increased in cross section in many instances, particularly on the larger vehicles.

In spring suspension the usual amount

Digitized by Google

of ingenuity has been expended. The once all but universal semi-elliptic spring has been replaced in many cases by full elliptics and three-quarter platforms. Further springs have been improved in hidden structural details, such as by the use of the

STODDARD-DAYTON "9-F" LIMOUSINE



costly and high grade metals, which are capable of greater elasticity and longer life than ever was imagined by the pioneers of the carriage trade.

The tendency toward increasing the number of cylinders with no limit in sight, which was so noteworthy a few years ago, has ceased, and the pendulum is swinging back toward lighter and simpler constructions more suited to the needs of the masses. Of course, there are and will always be structures suited to a limited class who admire the smooth running of the multiple cylinder motor and to this class the big six cylinder machines, of which there are a goodly number, will appeal, but the lighter fours will attract the attention of the majority, with a limited number of two cylinder cars like the Jackson, Lambert and Maxwell which, though made in large numbers, do not form an impressive array at the show.

Perhaps one of the most remarkable developments, if not of the past year, certainly of the past two years, has been the growth among the makers in the popularity of the magneto. On a very large number of cars of medium price it is obtainable as an option, while on a smaller but correspondingly noteworthy group of cars it is found as a regular part of the stock equipment, and so featured by the manufacturer. As a matter of course, the use of the high tension system has been adopted by the makers of the more luxurious types of vehicle, almost without exception.

Among other items of simplification which this movement has aided very largely is the clearing of the dash, which this year will be more marked even than it was a year ago, when it was widely commented upon. Oiling systems have been simplified and placed on or near the parts they serve instead of on the dash. Speedometers and odometers and often clocks have been combined into one instrument, which is a serviceable ornament instead of a complicated clutter.

The two stroke cycle motor as used by the Atlas, will be shown in slightly increased numbers and will attract attention more than ever because of the possibilities of lower cost and still greater simplicity; both of which lead toward a larger use of the motor vehicle. The friction drive is another simple device which is capable of superior service. Shown for several years on the Lambert and Carter car it is winning recognition as a satisfactory drive for light vehicles where ease of manipulation and wide range of speeds is needed.

HOLSMAN "GENTLEMEN'S AUTOMOBILE"

While mechanical tendencies no longer form the attraction to the show-goer that they used to do, there are still a number of points about which no little interest hinges even for the layman. Furthermore, it is noteworthy that as time goes on, these questions concern more deeply the technical side of motor construction. Where a few years ago the number of cylinders employed, the relative advantages of shaft and chain drives, and the comparison of weights and powers absorbed the attention of the visitor very largely, now the use of the finer materials of construction, and other considerations which formerly appealed only to the designer and builder are coming to the notice of the ordinary observer.

One of these considerations is revealed in the wide divergence of practice in the use of ball and roller bearings. With the exception of the crank shaft, it is now customary to use some sort of anti-friction bearing on practically every journal of the high grade car. In respect to the exact type employed, however, there appears to be no general agreement among the designers. In some instances the advantages of the annular ball type are exploited with especial vigor by makers who employ them practically throughout their cars. Others, with equal eranestness sing the praises of the roller bearing and use it with commendable consistency. In still other cases "mixed" practice is found, rear axles being mounted in roller bearings, while the shafts of the gearsets are carried by ball bearings. Occasionally front and rear wheels are mounted on different types.

Digitized by Google

Examples of the use of roller bearings on all four wheels are to be found in the case of the Acme, Stoddard-Dayton and some of the Lambert models, while ball bearings are used on the American, Brush, Moon, National, Pennsylvania, Premier, and some others. Other designers who employ ball bearings at one place and rollers at another, and, like the Marmon, employ rollers on the front wheel bearings and balls on the rear, or like the Mitchell, have balls in the front and rollers in the rear.

In general the use of roller bearings seems to be increasing, although the users of ball bearings have lost no enthusiasm and their use is rapidly extending, particularly to the smaller parts, where space and weight is of some importance. The fact that the roller depends upon a line of contact instead of a point renders it more able to carry a heavy load, and thus accounts for a preference in the certain places. The tendency toward the use of ball bearings on the motor shafts seems not to be increasing, although the new Holsman motor employs balls throughout.

In a word, the growing use of the antifriction type of bearing is a marked tribute to the general adoption of modern and improved methods of accurate interchangeable production and to the use of high grade metals. Without these features, the bearings would be practically useless, since any inaccuracy of alignment, any inequality in the temper of the material of either balls, rollers or races, or of any undue degree of hardness or softness would cause the load to be unequally divided on the tiny supporting units, causing their breakdown.

Another point which is still productive of no small amount of difference in the practices adopted by the various makers is the cooling problem. There is no longer the old question as to the relative supremacy of the water and air cooling methods, for those makers who have continued to retain the air-cooling system are by this time firmly fixed in their adherence to it. With rare exceptions, it will be observed, the motors of the larger cars are cooled by water, while the smaller machines, and notably in the case of the motor buggy type of vehicle, are more apt to be air cooled. Indeed in the latter type air cooling is almost exclusively encountered.

But if there is less rivalry between the types of water and air cooled motor than formerly, the different methods by which the two solutions of the cooling problem may be approached left sufficient divergency to afford no small amount of variety in the field. This in the simpler air-cooled type, the method of circulating the air around the cylinders, the method of forming and arranging the radiating flanges even the location of the flanges of the cylinders, will be found to vary considerably, if closely observed. In the case of the water cooled motor, on the other hand, practical differences which are of considerable im-

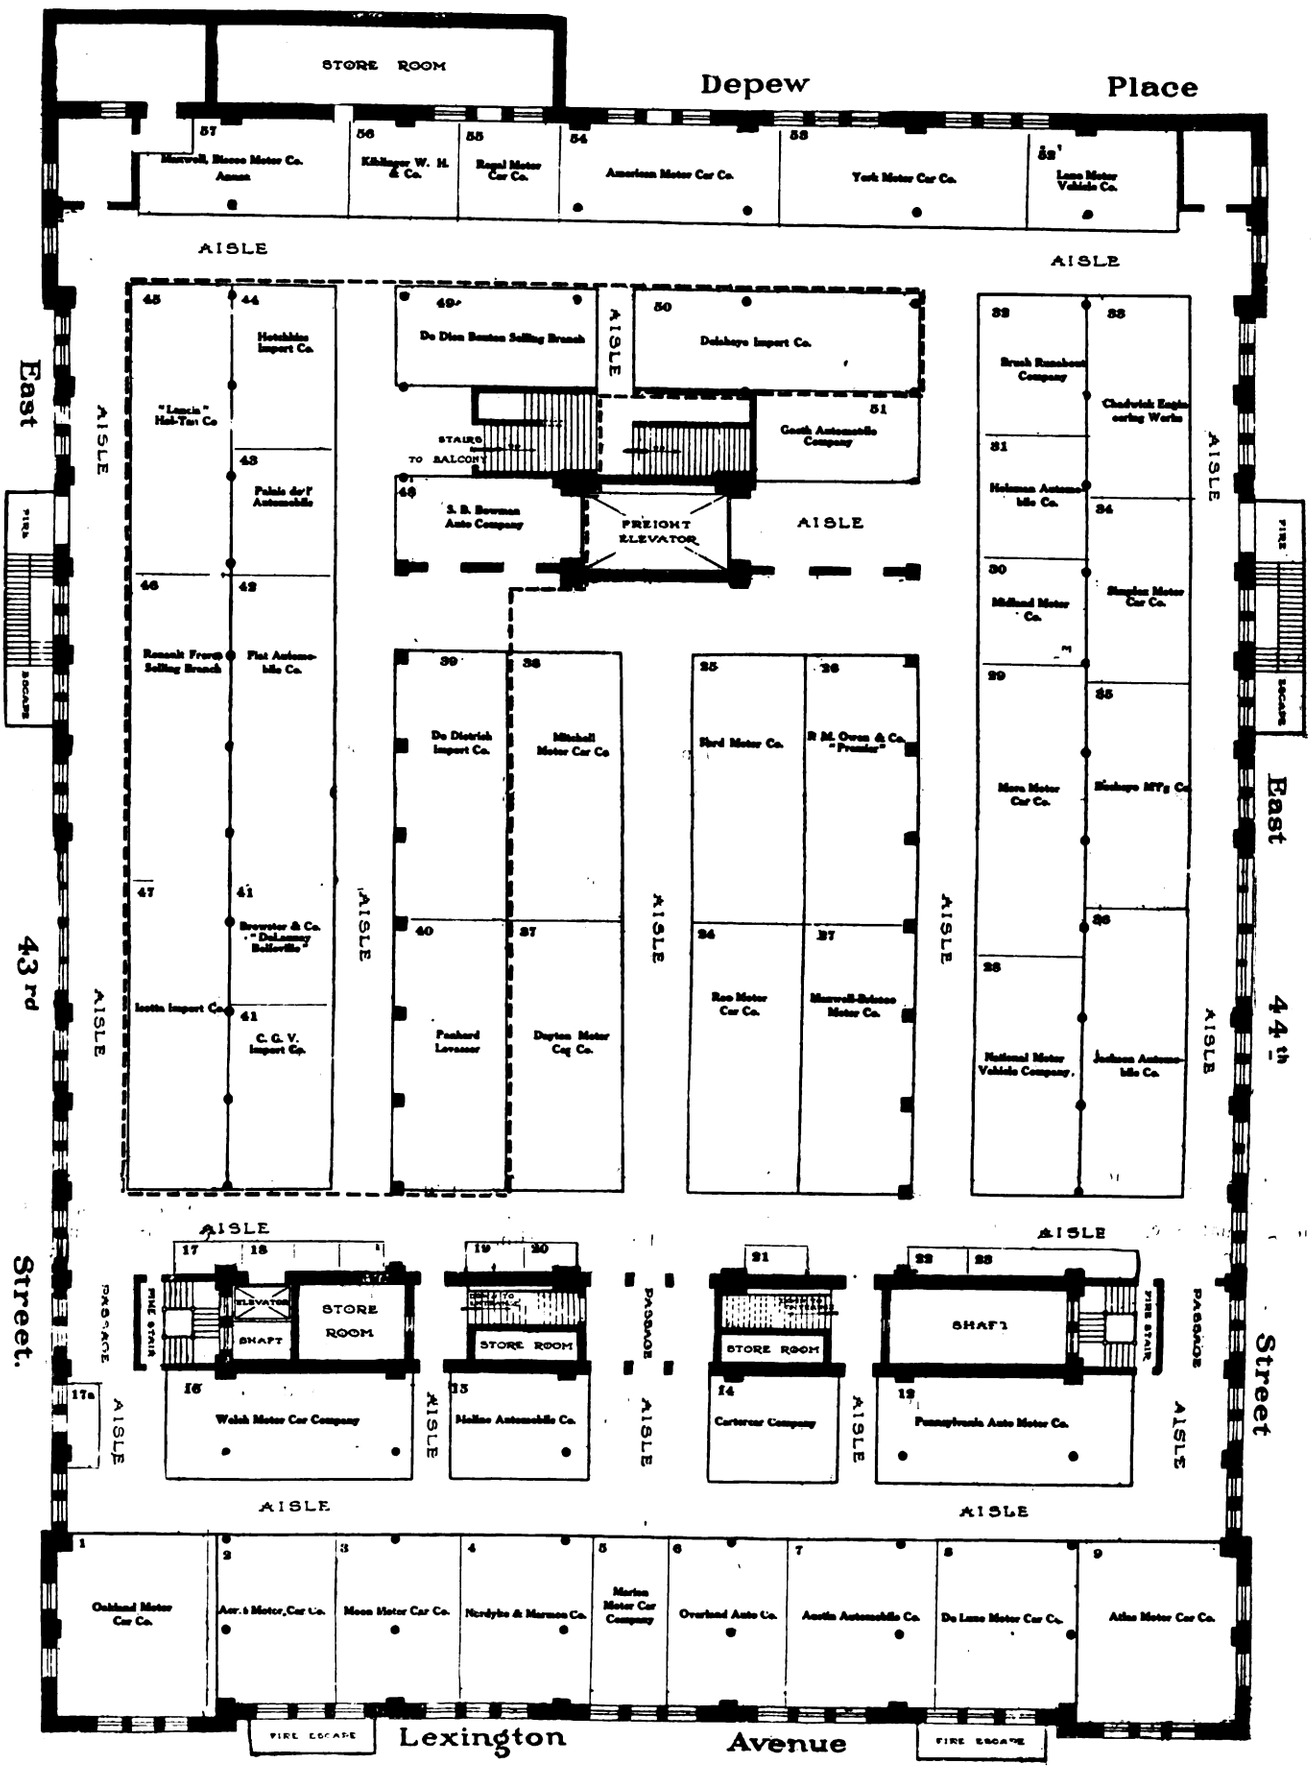
portance exist in the various ways in which the piping connections are arranged, the size, shape and construction of radiators and water water jackets, and finally the method of circulating the water.

Most of the makers agree in the use of the pump in one form or another, though there is still considerable difference of opinion as to what form of pump affords the most satisfactory service. This, with differences in the method of actuating it, differences in its location and differences in the way in which it is connected into the system afford ample opportunity for criticism and investigation.



Although but little has been heard of the use of the thermo-syphon or gravity system of circulation, it is used to an extent which is probably much greater than commonly is imagined. At the show it will be found that the makers of the Brush, the Jackson, Lambert, Maxwell, Moline and several other cars use this natural circulation in some or all of their models. The advantage of thermo-syphon circulation is that the pump is omitted, the slight power required to drive it is saved, its elements of noise and trouble are eliminated and the first cost of the vehicle as well as its probable maintenance expense may be lower.

Uniformity in the production of cars of the medium priced type, has been mentioned as one of the features of the show, at the same time the variety of machines exhibited is so broad as to leave nothing to be desired in the way of vehicles at prices either very high or very low. As a matter of fact, from the $6,000 Acme, and the $5,000 types of the National and American cars, the descent to the $450 and $500 grades is remarkably uniform and it would appear that, even discounting all the mechanical features of the machines, the prospective purchaser desiring to secure a car at a certain fixed sum, would have little difficulty in finding satisfaction.

As a means of completing the study of the show, the serious-minded visitor cannot fail to take note of the price question, observing how the respective makers, animated by the desire to impress upon the purchaser the high rate of concrete return he is getting for the money spent on his car, are vieing with each other in the use of better equipments, better materials, better design, and always to make good the assertion that theirs is the most car for the least money. In many cases the result is truly remarkable from the bargain-counter point of view alone. Such cars as the little Maxwell, and the $850 Ford, or the $1,200 to $1,500 class, including such machines as the Cartercar, Oakland, Mitchell, Jackson, Lambert, Overland, and the "Doctor" Maxwell, all of them either just below or a great deal below the range of the so-called medium priced product, furnish ample opportunity for close inspection and profitable investigation, both as cars, and as sterling examples of highly economic mechanical production.

PALACE SHOW—PLAN OF MAIN FLOOR

Digitized by Google

Where Accessories, Tires and Parts Prevail.

From the amiable amblers who stand with wide-eyed interest when things are explained to them and are so very, very grateful at being shown even when it is certain that they understood no part of it, to the keen and eager technical inquirer, every visitor at a big automobile show finds the portions devoted to parts and accessories well worth while. The Palace show is particularly rich in the variety and number of its accessory exhibits, which embrace everything from demonstrations of how to keep coffee hot in a bottle forever to Graeco-Roman arguments on the ion valences of tertiary inductions. What is more, everybody is given a chance each night to win $5 and possibly $20, all that is required of the successful candidate for the cash being that he shall beat everybody else in a demountable rim changing contest.

And those who do not want to struggle against a stop watch for the $5 can have the fun of seeing a lot of other people make a play for the money. Tiring of the more frivolous side, it is possible to go in for pre-digested technical information. If the visitor never could understand how a thermo-syphon cooling system works, his case is provided for by a complete system of the sort in full operation and having glass tubes at different points, through which one may look and see just what happens inside and how the water insists on going downward when it cools. Similarly if the tangle of thick and thin wires on an automobile motor, connected up to various boxes, revolving contraptions and miniature steel dog houses, presents no clear and reasonable purpose to the mind beyond a hazy conviction that somehow it all helps the engine run, it is possible to take a 15-minute lesson in ignition and electricity that will elucidate the mystery so completely as to make all motor wiring appear to the graduate's eye as simple as a bone collar button.

In fact the whole spirit of the parts and accessories exhibits is one of welcome for the residents of the figurative Missouri, and if the investigator be technically equipped he has the rare pleasure of meeting demonstrators who are qualified to give him satisfactory reasons and answers to his inquiries, an experience he is far less likely to encounter when dealing with those whose duty it is to explain the merits of the complete cars.

Next to tires, ignition apparatus is one of the dominating elements in the accessories exhibit, although under a wider generalization the group of parts and materials offered for the consideration of designers and builders is perhaps the largest of all. The lesser classifications include speed indicators, wind shields, shock absorbers, and signals, and an extensive list of attachments and specialties contributing to the luxury of motoring.

Among the more prominent tire company exhibits, those of the Diamond Rubber Co., Hartford Rubber Works, Continental, Morgan & Wright, Michelin, Firestone, G & J, Empire and Goodyear, are naturally conspicuous, and are centers of interest as to the 1909 offerings which they disclose. In the Diamond space the newest thing is the improved and simplified Diamond demountable rim, which is supplied in both a touring car and a racing style. In principle it adheres to the usual type, but presents differences in detail which afford advantages. The Diamond "Grip" tires, with anti-skid treads, are the perfected products of the company's new construction. Great stress is laid on the exceedingly tough treads which characterize the Diamond line of tires for 1909.

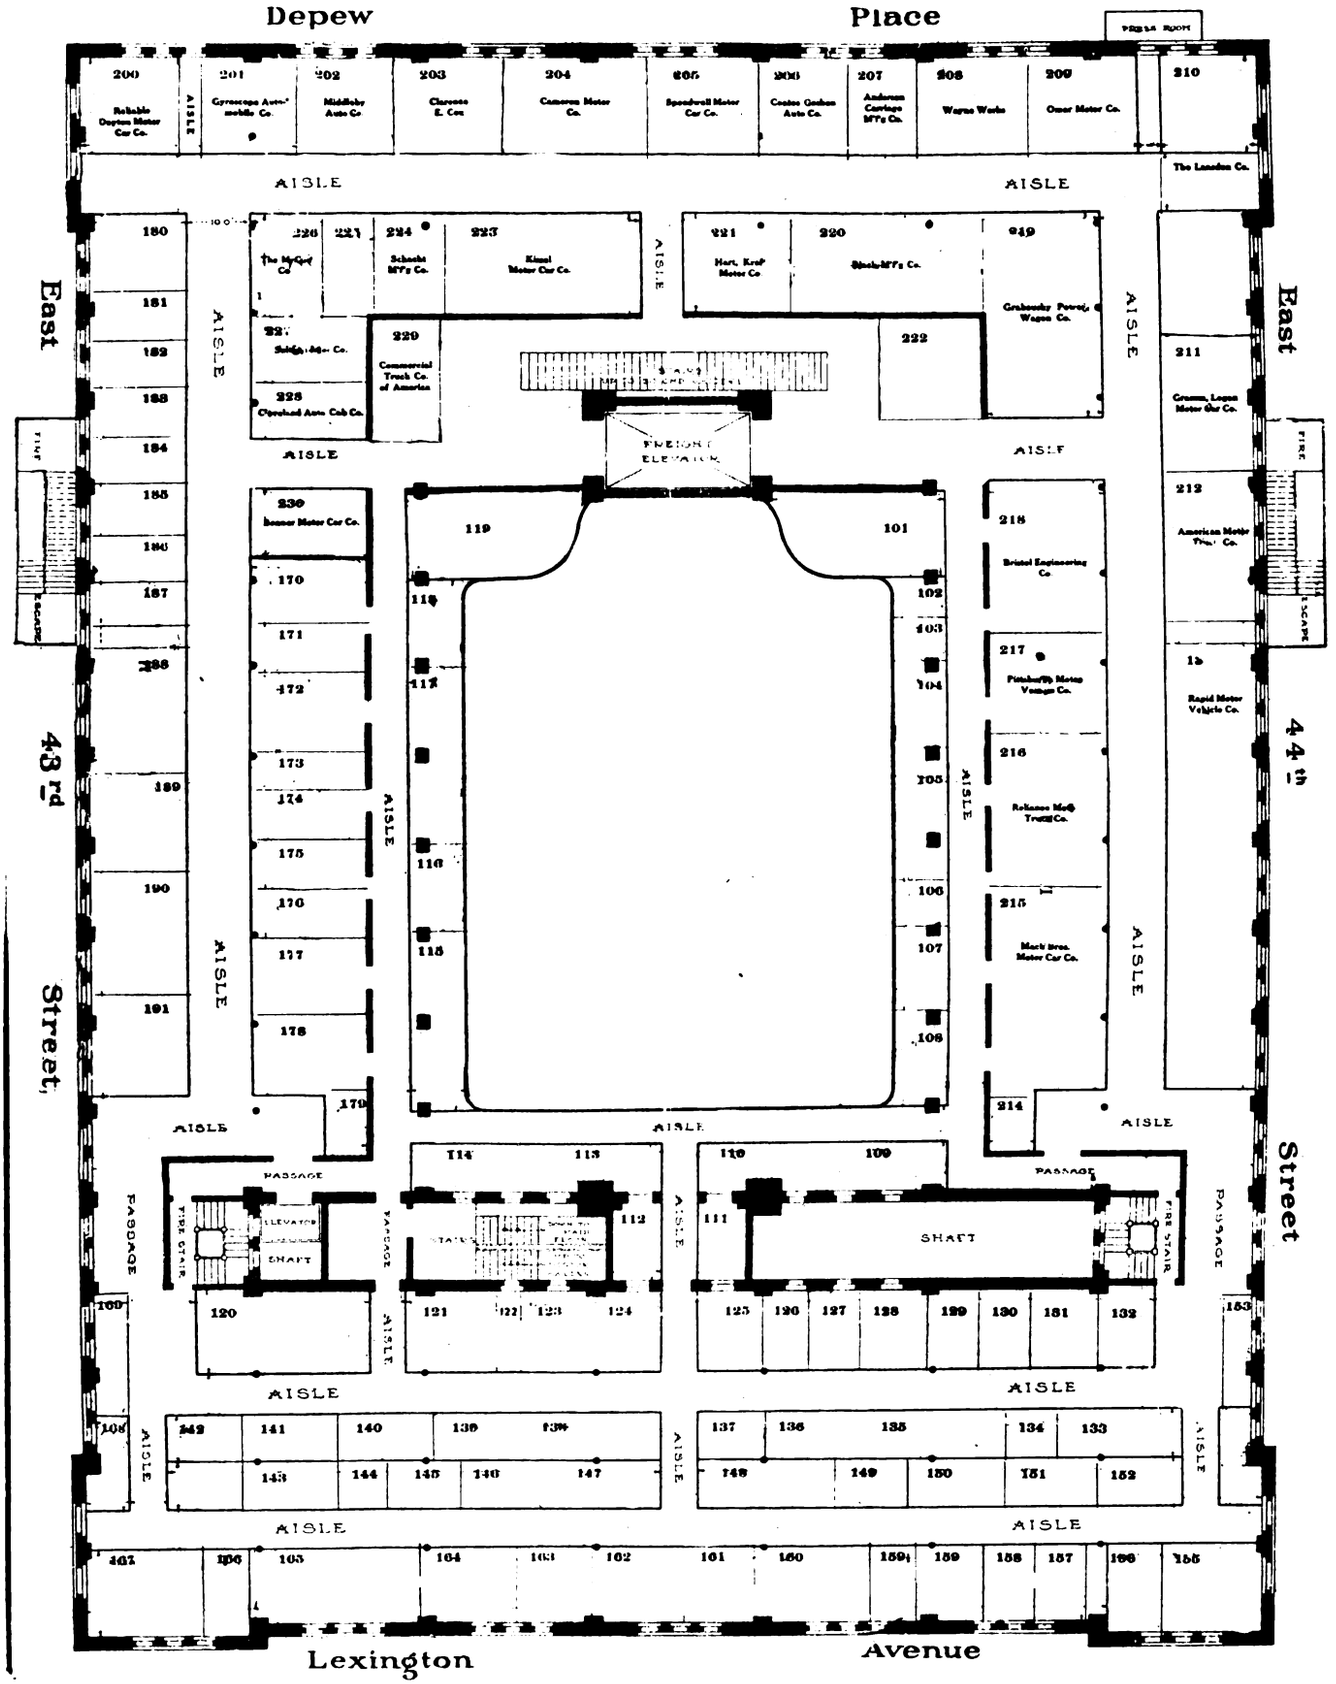
It is at the booth of the Continental Caoutchouc Co., of New York, that the daily $5 prizes are offered to any automobile owner, prospective owner or chauffeur making the best time in changing the Continental demountable rim. At the end of the week a cash prize of $20 will be given to the person making the best time during the entire period of the show. The records are to be carefully tabulated and the books open for examination at all times. The Continental tires on exhibition include the round tread and AC flat tread, guaranteed for 3,500 miles; the flat tread type course, guaranteed for 4,500 miles; and the non-skid, steel studded type, having a 2,000 mile guarantee.

The new "Standard Universal Quick Detachable" rim, which has not been seen by show visitors before, is on view at the Hartford Rubber Works Co.'s space. In addition to the regular sizes, Hartford tires are shown in the new 31x4 and 33x4 sizes, for application to 30x3½ and 32x3½ rims, respectively. Morgan & Wright also stage the new "Standard Universal" rim. In the tires a new, heavy flat tread is featured, with claims for increased traction and puncture protection. A special tire for electric pleasure vehicles has been added to the line, its soft absorption of road irregularities being calculated to lessen current consumption and increase the service efficiency.

The Goodyear detachable and clincher tires and the Goodyear quick acting rim form the backbone of the exhibit of the Goodyear Tire & Rubber Co. The Goodyear air bottles, which made their appearance during the summer, but for which the Palace exhibition is a show debut, are represented in four sizes. The "bottles" are steel tanks filled with compressed air so that they may be used in filling tires. Each bottle is equipped with a pressure gauge by the readings of which the filling of the tire to the proper pressure may be controlled. The sizes run from the small motorcycle style to a big garage bottle.

Leather covered steel tires have been added to the Empire Automobile Tire Co.'s line, while the Republic Rubber Co. has produced a non-skid tire having rubber projections. At the Ajax stand a new non-skid is shown and members of the trade are given a hint of a valuable Ajax souvenir to come. In the class "unusual," is a cushion tire invented by Irving Snell, of Little Falls, N. Y., the tread of which is like a coarse herringbone gear.

Where different size wheels are used on a car for the front and back, a combination Stepney spare motor wheel that will fit either the front or back rims has been devised and is to be seen in the display of the Spare Motor Wheel of America, Ltd. The regular Stepney rims are revealed in various sizes and colors, and demonstrations are given as to how they may be applied to either clincher or quick detachable rims. Each Stepney carries a fully inflated tire which is ready for service immediately the rim is applied.



With the same interest that they watch magicians pound up gold rings and burn ladies' handkerchiefs, the crowds still respond to the fascination of seeing tacks and nails driven into Dow tubes, later to be withdrawn without the tubes becoming deflated. The stand of the Dow Tire Co. is destined to be a crowd center during the week. Weed grips, shown by the Weed Chain Tire Grip Co., present no external difference from last year, but the cross chains are now subject to a special treatment which affords two or three times the mileage that was formerly possible.

Magnetos are represented as never before, with such products as the Splitdorf, Remy, Bosch, U. & H., Volta and others. Wheeler & Schebler make their bow as magneto manufacturers, and the Pittsfield Spark Coil Co. is in the field, as is the Hess-Bright Co. The Connecticut Telephone & Electric Co., of Meriden, Conn., has prepared its usual excellent showing of switches, meters, indicators, terminals, coils, timers and distributors, with 1909 improvements. The distributer is decidedly new. The Witherbee Igniter Co., of New York, besides having a gasolene engine running day and night, equipped with one of its Volta magnetos, and all of the "Wico" products that can be applied to it, will show a Witherbee battery furnishing power for changeable electric signs.

A "battery saving" timer, in which the arc of dwell can be reduced from the usual 45 degrees to 15 degrees, is a novelty of the Autocoil Co., of Jersey City, the company also offering its coils. To explain the operation of the ignition system of a motor car the National Carbon Co., of Cleveland, has built a special and elaborate piece of

PALACE SHOW—FIRST GALLERY

Digitized by Google

apparatus, which analyzes the ignition system and shows the action of the spark and proves that the relation of current consumption to results varies considerably according to circumstances. It is said to be the only apparatus of its kind in existence.

"Patent leather lamps" are not such a startling innovation as they sound, because the racks in the display space of the Badger Brass Mfg. Co., of Kenosha, Wis., show them to be very substantial brass. The "patent leather" part of it refers to a black metallic, lacquer-like lustre or finish resembling that material in appearance. The Solar lamps are made up in a bewildering number of combinations of the "patent leather," polished brass and nickel exterior surfaces. Some of the lamps on exhibition will puzzle the uninformed to account for the movable levers they bear. It may be parts of a neat mechanism for eclipsing or reducing the amount of light the lamps project. On city streets it is rarely necessary to use the full strength of the more powerful "Solar" light projectors, and the eclipsing device reduces the light so that traffic coming in the opposite direction is not annoyed by the blinding glare. The array of Solars entends from the big lamps down to oil side and tail lamps, the line also including electric lamps and acetylene generators.

Entirely different in appearance irom previous models, the Warner Auto-Meter, made by the Warner Instrument Co., of Beloit, Wis., blossoms out for 1909 in much handsomer form. The exhibit discloses the fact that both the odometer and the speed indicating mechanism are contained in the one case, the latter being circular in form and having apertures in its face through which the speed and mileage readings appear. No change has been made in the vital parts of the speed indicator, the successful magnetic principle being retained. The odometer mechanism, however, is now of Warner manufacture, and has a trip register reading to 1,000 miles and a season register reading to 100,000 miles. Above the dial, but concealed inside of the bevel glass cover, is a miniature electric light which can illuminate the dial brilliantly on the darkest night.

A double tone whistle has been added to the Gabriel family of horns and signals. While resembling the three toned exhaust horns it is intended to be more shrill. The space of the Gabriel Horn Mfg. Co., of Cleveland, also contains demonstration apparatus for the Gabriel shock absorbers. The latter class of devices have suffered diminution rather than increase so far as the number of makers exhibiting is concerned. A new Richmond in the field, however, is Ernest Flentje, of Cambridge, Mass., with a glycerine recoil shock preventer.

The Jones Speedometer exhibit features the new models of low price. Three instruments, known as models 27, 28 and 29, and priced at $25, $40 and $50, are among the leaders. The complete Jones line embraces 20 different instruments, giving the purchaser the opportunity of wide selection, particularly as the prices range from as low as $15 up to $100.

"Oil and water won't mix," and the fact is taken advantage of in the Snell hydraulic system of handling oil and gasolene as exemplified in the apparatus of the Hydraulic Ooil Storage Co. The system also depends on the difference in specific gravity of water and oil. The tanks are always full of liquid, for when oil is drawn off, more water enters underneath the remainder. A model of the system being installed for the new York Taxicab Co., is shown, the absence of gasolene valves and other intricacies being emphasized.

Curiosity as to what is inside the new "multipolar induction type" speed indicator which the Stewart & Clark Mfg. Co., of Chicago, has added to its line this year may be satisfied at the company's stand by getting in the good graces of the attendant demonstrator. From the descriptive adjectives it is evident that the instrument differs radically from the centrifugal types which make up the balance of the Stewart line. A big exhibition case showing all the models in operation is the main feature of the exhibit.

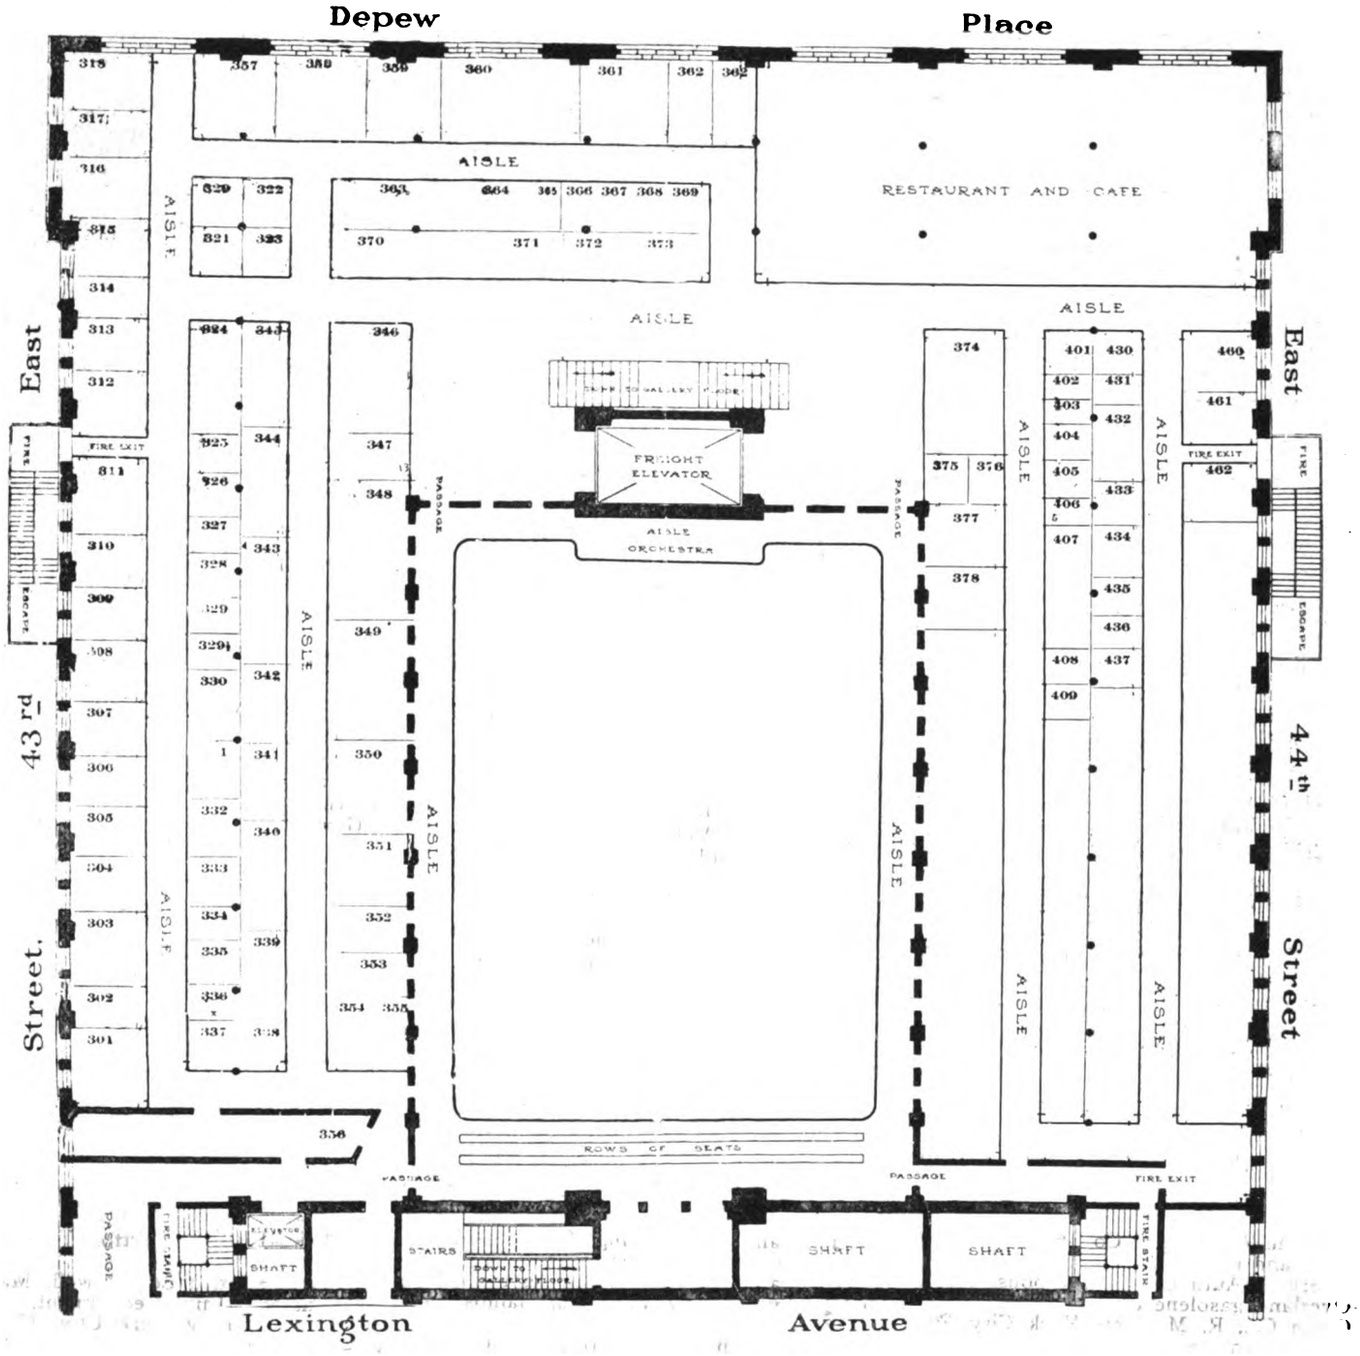
Tire trunks, which sprang into favor during the past season as handy space savers with the virtue of easy access, are given a new construction for 1909 In the specimens which will be displayed during the week by the Nathan Novelty Mfg. Co. Instead of the paper and duck which have been used in this type, the styles shown are made of hard wood filled with a special waterproofing. An adjustable lock, which will well as the trunk, presents an improvement.

For the manufacturer of cars who is harnessed by production problems, great temptations to cast off a large part of his burdens on other shoulders exist in a trip around the Palace balconies. The William Cramp & Sons Ship & Engine Building Co., of Philadelphia, has rigged an enticing display of all kinds of automobile parts for which the company has supplied the metal, made the complete castings or delivered the finished product. The numerous ways in which Parsons' manganese bronze and Parson's white brass are forcefully indicated by the exhibit. Isaac G. Johnson & Co., of New York City, show a new metal known as Monel and containing from 60 to 70 per cent. nickel, which registers a tensile strength of 85,000 pounds per square inch, and which has remarkable non-corrosion qualities. It can be exposed to the atmosphere indefinitely without rusting. An unique exhibit of die castings, with specimens of pieces cast complete with finished keyways, slots, lugs, threads and clearance holes, is shown by the Wetherill Finished Castings Co., of Philadelphia. The work is done in either aluminum or Parson's white brass.

Front and rear axles complete with hubs and bearings are offered in such attractive forms and with such sureties of quality that resistance may be imagined to be difficult no matter how well the manufacturer is himself equipped to produce these parts. The Timken Roller Bearing Axle Co., of Canton, O., gives it first show view of the new pressed steel rear axle which was recently described at length in the Motor World. The exhibit also contains numerous suggestions of the great variety of ways in which Timken roller bearings may be and are employed in automobile practice.

A steel jacketed rear axle in oil, is a feature of the axle display which the American Ball Bearing Co., of Cleveland, O., has arranged. Many combinations for widely differing requirements are shown.

The Standard Roller Bearing Co., of Philadelphia, has new things to offer in this year's exhibit in its latest annular ball bearings and annular roller bearings, together with the improved Grant bearing. Axle production is a part of the concern's activities, too, as is indicated by the specimens of front and rear axles. Another Philadelphia concern, the Merchant & Evans Co. Mechanical Department, has entered the lists for front and rear axle business, displaying with some pride the "Evans" rear axle transmission. In addition to axles this company is offering, among other of its specialties, tire and tool cases of steel, which completely enclose the spare tire but utilize the space available in the center of the big diameter of the tire as a tool box.



Chains, both imported and American, are to be found among the exhibits. Of the imported chains those handled by Charles E. Miller, of New York City, are by far the best known. For several years he has been the American agent for the Brampton chains made by Brampton Bros., of Birmingham, England, who were established in 1852 and who are said to be not only the oldest but the largest manufacturers of motor car, bicycle and machinery chains in the world. Several well known American cars use the Brampton chain, which has established a reputation throughout the country.

Whitney chains in many new forms make their initial appearance at the show. A number of improved roller chains for motor buggies and trucks have been evolved by the Whitney Mfg. Co., of Hartford, Conn., since the show last year. A "quiet chain," Schmidt patent, will be demonstrated, as will the Whitney chain belt. The full line of products will be represented, including samples of the new high speed vertical attachment for the Whitney hand miller, both in the plain and universal form.

No radical changes will be observable in the chains exhibited by the Diamond Chain and Manufacturing Co., of Indianapolis, Ind. Improvements in details have been made, however, and a decided advan-

Digitized by Google

PALACE SHOW—SECOND GALLERY

tage over former production has been brought about by alterations in the quality and heat treatment of the steel from which the chains are made, giving an increase in tensile strength of from 25 to 100 per cent.

Baldwin detachable chains will be well shown by the Baldwin Chain & Mfg. Co., of Worcester, Mass., but the regular lines mark no differences from last year. The company is exhibiting a steering gear which is declared to be entirely novel and which has not been put on view before.

Motors ready to go into a car are to be met at almost every turn in the Palace balconies. Of the veterans in the field, the Western Motor Co., of Logansport, Ind., is to be considered a leader. Four of its "Rutenber" motors will be on view for the week, including a new 6-cylinder.

A 6-cylinder, 2-cycle motor is being put on exhibition by the Leather Tire Goods Co., of Newton Upper Falls, Mass. The motor operates with a single carburetter and exhausts into one muffler. It has no valves and only thirteen moving parts. The makers say that it can be throttled down to as low as 80 r.p.m. without backfiring or missing. By a simple cut-out arrangement three cylinders alone can be used without entailing complications or negative work on the part of the idle cylinders, a possibility which is very promising for low speed work. Investigators are promised every opportunity to satisfy themselves as to whether the motor in actual practice can perform according to the representations.

A pot-pourri of small things, such as the famous Columbia lock nuts, copper asbestos gaskets, seamless flexible copper hose, pump pressure registers, etc., add a flavor to the accessory and parts mixture which the technical epicure enjoys.

WHO WILL SHOW AT THE GARDEN

List of Exhibitors Numbers 280—Where Cars Will be Staged—Distribution of the Other Departments.

Showing a total of 294 displays, the list of exhibitors at the show of the Association of Licensed Automobile Manufacturers, which is to open in Madison Square Garden on Saturday, January 16th, has just been announced. Of individual exhibitors, manufacturers and dealers, there will be 280, the difference being caused by deductions for stands devoted to publications, and for the several manufacturers of cars who will stage displays in more than one of the three main departments to be devoted to the exhibition of cars, comprising the gasolene pleasure vehicles, electrics and the commercial types.

DECORATIVE SCHEME OF CONCERT HALL FOR THE GARDEN SHOW

As in former years, the main floor and elevated platform at the sides of the great arena will be devoted to the purposes of the automobile manufacturers who are producers of complete, gasolene-driven vehicles. In the restaurant in the Madison avenue end of the Garden, the displays of electric vehicles will be staged. The basement will be divided between the makers exhibiting commercial vehicles of all motive powers, the manufacturers of motorcycles, and a number of accessory exhibitors. The upper regions of the Garden, of course, will be given over wholly to the displays of parts and accessories. Space allotments to exhibitors of this class include locations in the Concert Hall, with its novel scheme of decoration in which the setting of the exhibits will be under a giant trellis covered with vines and illuminated by concealed incandescent lamps.

The roster of the show reveals 40 exhibitors of complete cars, seven of whom will show vehicles on more than one stand; 26 exhibitors of motorcycles, and 214 exhibitors of parts, accessories and sundries. The complete exhibitors' list, together with the general location of the displays, is as follows:

Main Floor.

Knox Automobile Co.
Matheson Motor Car Co.
Elmore Mfg. Co.
Cadillac Motor Car Co.
Pope Motor Car Co.
Royal Motor Car Co.
Autocar Co.
Everitt-Metzger-Flanders Co.
Corbin Motor Veh. Corp.
Studebaker Automobile Co.
Electric Vehicle Co.
F. B. Stearns Co.
Packard Motor Car Co.
Geo. N. Pierce Co.
E. R. Thomas Motor Co.
Chalmers-Detroit Motor Co.
H. H. Franklin Mfg. Co.
Locomobile Co. of America.
Pope Mfg. Co.
Winton Motor Carriage Co.
Stevens-Duryea Co.
Peerless Motor Car Co.
Lozier Motor Co.

Elevated Platform.

Selden Motor Vehicle Co.
Haynes Automobile Co.
Simplex Automobile Co.
Hewitt Motor Co.
Walter Automobile Co.
Woods Motor Vehicle Co.
The White Co.
Apperson Bros. Automobile Co.

Exhibition Hall, Madison Avenue Front.

The Waverley Co.
The Electric Vehicle Co.
The Rauch & Lang Carriage Co.
S. R. Bailey & Co., Inc.
The Anderson Carriage Co.
Babcock Electric Carriage Co.
Studebaker Automobile Co.
Baker Motor Vehicle Co.

Basement, Commercial Vehicle Department.

Knox Automobile Co.
General Vehicle Co.
Champion Wagon Co.
H. H. Franklin Mfg. Co.
Studebaker Automobile Co.
E. R. Thomas Motor Co.
Alden Sampson, 2d.
Hewitt Motor Co.

Elevated Platform, Accessories.

The B. F. Goodrich Co.
The Diamond Rubber Co.
C. F. Splitdorf.
The Goodyear Tire & Rubber Co.
Shelby Steel Tube Co.
The Brown-Lipe Gear Co.
G & J Tire Co.
Briscoe Mfg. Co.
Gilbert Mfg. Co.
Automobile Improvement Co.
Auto Improvement Co.
Vacuum Oil Co.
Herz & Co.
S. F. Bowser & Co., Inc.
Gray & Davis
The Veeder Mfg. Co.
R. E. Dietz Co.
Atwater-Kent Mfg. Wks.
Baldwin Chain Mfg. Co.
N. Y. & N. J. Lubricant Co.
Warner Instrument Co.
Light Mfg. & Fdy. Co.
Empire Automobile Tire Co.
The Autocoil Co.
The Swinehart Clincher T. & R. Co.
Remy Electric Co.
Dow Tire Co.
Jones Speedometer.
Conn. Tel. & Elec. Co.
Morgan & Wright.
Continental Caoutchouc Co.
Spicer Universal Joint Mfg. Co.
J. H. Sager Co.
The R. E. Hardy Co.
Ajax-Grieb Rubber Co.
Weed Chain Tire Grip Co.
Consolidated Rubber Tire Co.
F. H. Wheeler.
Witherbee Igniter Co.
The Republic Rubber Co.
The Duff Mfg. Co.
The Chandler Co., Inc.
Michelin Tire Co.
Leather Tire Goods Co.
Adam Cooks Sons.
Avery Portable Lighting Co.
Fox Metallic Tire Belt Co.
The Globe Machine & Stamp Co.
Janney-Steinmetz & Co.
Firestone Tire & Rubber Co.
Oliver Mfg. Co.
The Timken Roller Bearing Axle Co.
Hartford Suspension Co.
Penn. Rubber Co.
Manufacturers Fdy. Co.
Motsinger Device Mfg. Co.
Atwood Castle Co.
Byrne-Kingston & Co.
The Wm. Cramp & Sons Ship & Engine Bldg. Co.
A. W. Harris Oil Co.
Brennan Mfg. Co.
The Warner Gear Co.
Phineas Jones & Co.
The Standard Welding Co.
The American Ball-Bearing Co.
The Badger Brass Mfg. Co.
The Fisk Rubber Co.
Diamond Chain & Mfg. Co.
Pittsfield Spark Coil Co.
Rose Mfg. Co.
Whitney Mfg. Co.
The Hartford Rubber Wks. Co.
A. R. Mosler & Co.
Gabriel Horn Mfg. Co.
Joseph Dixon Crucible Co.
Heinze Elec. Co.
C. T. Ham Mfg. Co.
Valentine & Co.
Hyatt Roler Bearing Co.

Balcony.

McCord Mfg. Co.
Geo. A. Haws.
C. A. Shaler Co.
Wm. C. Robinson & Sons Co.
Cook's Standard Tool Co.
A. C. Smith Co.
Eastern Carbon Wks.
Allen Auto Specialty Co.
Jeffery-Dewitt Co.
Morrison-Ricker Mfg. Co.
N. Y. Sporting Goods Co.
Metal Stamping Co.
Hydraulic Oil Storage Co.
Hopewell Bros.
I. S. Bretz Co.
Pierson Motor Supply Co.
Havoline Oil Co.
Apple Elec. Co.
Isaac G. Johnson & Co.
The Auto Pump Co.
The Rushmore Dynamo Wks.
English & Mersick Co.
E. M. Benford.
K. W. Ignition Co.
Austro-American Separator Co.
Wm. R. Winn.
N. Y. Coil Co.
Voorhees Rubber Mfg. Co.
American Thermos Bottle Co. of N. Y.
L. J. Mutty Co.
The A.-Z. Co.
High Frequency Ignition Coil Co.
H. H. Franklin Mfg. Co.
Keystone Lubricating Co.
Leon Mann Co.
P. Rielly & Son.
Philadelphia Timer & Machine Co.
Jarman & Baker.
R. I. V. Co.
Atlas Rubber Co.
Champion Ignition Co.
Burnet Compound Spring, Inc.
Buda Fdy. & Mfg. Co.
Chas E. Miller.
Trenton Rubber Mfg. Co.
O. W. Young.
Anderson Forge & Machine Co.

Comptoir D'Innovations Pour Auto.
Nathan Novelty Mfg. Co.
Noonan Tool & Machine Wks.
Pratt & Whitney Co.
Philadelphia Storage Battery Co.
The Troy Car. Sun Shade Co.
The Garvin Machine Co.
Faultless Auto Tube Co.

Program for the Engineers' Meeting.

As already announced, the fourth annual meeting of the Society of Automobile Engineers will convene at the Automobile Club of America on Tuesday morning, January 5th. The complete program shows that the entire forenoon will be devoted to making tests with various cars on the club dynamometer, under the supervision of Henry Souther, head of the technical committee of the club. Following this there will be the usual business meeting and a technical session during the afternoon, the subjects to be discussed being the "Economics of Weight Reduction," by F. D. Howe; "The Factor of Reliability in Ignition Apparatus," by A. Atwater Kent; "Requirements of Automobile Brake Construction," by Thos. J. Fay and Lawrence Whitcomb. Immediately following the readings the annual dinner will be held. After the dinner the meeting will adjourn to Tuesday, January 19.

On the date of adjournment a number of motor car tests will be made on the club's dynamometer, while in the afternoon papers on the following subjects will be read: "An Improved Type of Compression Coupling," by W. S. Noyes; "Standardizing Automobile Motor Bearings," by S. P. Wetherill, Jr.; "Some practical Considerations in Autogenous Welding," by Henry Cave; "Continuous Form of Engine Indicator," by S W. Rushmore and H. L. Towle. The afternoon meeting at which the papers will be presented will be held at the Engineering Societies Building, and the annual dinner at the Engineers' Club.

Studebaker to Have Big Individual Show.

During show time New York City will be rich in individual, independent shows conducted by various makers and agents. The latest announcement in this line is that of the Studebaker Automobile Co., which will devote the entire ground floor of the big Studebaker building at Broadway, Seventh Avenue and Forty-eighth street to a display of the various type of motor cars and vehicles made and sold by the company. The exhibit, in its variety, will be the largest ever assembled by an individual firm, since it will include gasolene cars from small runabouts to large limousines, a full line of electric pleasure vehicles, and electric commercial vehicles of types ranging from light delivery wagons to the heaviest trucks. Free bus service will be provided visitors to and from the Palace and Garden shows.

Motor Vehicles in the British Isles.

Statistics compiled by the Royal Automobile Club of England show that in the United Kingdom there were registered, up to September 30, 1908, a total of 154,391 motor vehicles, divided as follows: Private cars in England and Wales, 63,240; trade vehicles, 11,172; public conveyances, 5,461; motorcycles, 57,472; total for England and Wales, 137,345. Private cars in Scotland, 5,231; trade vehicles, 810; public conveyances, 384; motorcycles, 4,482; total for Scotland, 10,907. Pleasure vehicles in Ireland, 2,910; trade vehicles, 122; public conveyances, 5,880; motorcycles, 3,072; total for Ireland, 6.139. The total of each class of vehicles in the United Kingdom are: Private cars, 71,381; trade vehicles, 12,104; public conveyances, 5,880; motorcycles, 65,026.

America's Extensive Use of Automobiles.

It has been estimated that there are at present no less than 150,000 automobiles in use in America, and another estimate places the probable production of the forthcoming year at 75,000 new cars. On this basis, the parent industry is made to loom very large. But when it is considered that in the heydey of the carriage industry no less than 1,000,000 buggies a year were turned out during four consecutive seasons, it appears that the business of vehicle production enjoys possibilities which the automobile section of it has by no means begun to exhaust even yet.

Oregon Show Scheduled for March.

An automobile show for Portland, Ore., will be held next March, in the armory. Several of the Pacific Coast cities are planning shows and efforts are being made to provide for making a circuit which can use more elaborate decorative and attraction features than would the possible in any one of the cities undertaking to run a show wholly on its own account.

Buffalo to Hold February Show.

Buffalo's automobile show has been determined upon for the week beginning February 15, at Convention hall. The show will be held under the direct management of the Automobile Club of Buffalo, with the co-operation of the dealers and local manufacturers.

March Dates for Rochester Show.

The Rochester Automobile Dealers' Association, of Rochester, N. Y., has set its show for March 15 to 20, in Convention Hall. The executive committee of the show includes W. C. Barry, Jr., T. J. Northway, A. H. Zimbrich and George J. Bauer.

Kansas City Fixes Show Dates.

Dates for the automobile show at Kansas City, Mo., were chosen at the last meeting of the local dealers. The affair will be held at Convention hall, March 8 to 13.

Maine Show Opens February 22.

Portland, Me., will hold its show Feb will manage it. This will be the easternmost of all the local shows.

Makers Explain Their Products' Salient Points

With scarcely an exception, the motor cars at present in the market possess sufficient potential mileage, or "go" in other words, to make them a paying investment to the owner. Their actual worth in terms of passenger miles per dollar of cost and maintenance outlay, however, varies widely according to the type of vehicle and the purpose for which it is designed as well as the manner of its use. Those who are intimately acquainted with the industry are sufficiently familiar with the characteristics of the various cars to be able to make a sound discrimination, should they be called upon to choose a machine for their own individual use. To those who are beyond the pale—the rank outsiders—the task is a far more difficult and entirely bewildering one.

The would-be purchaser of a car, who knows nothing of motor car construction, is forced to rely largely upon the statements of the manufacturers and their agents in making his selection. Brought face to face with these in the course of a canvass of the field, a surprising amount of confusion is engendered in his mind, and frequently a vague impression that whatever the individual merits of the different machines, the question of price aside, the efforts of most salesmen are based upon the use of a few stock recommendations which appear to apply to the entire trade with astonishing generality.

It is not that a car must be radically different from others of its general class in order to be particularly worthy of the buyer's consideration. Indeed, the opinion is held by some manufacturers that the era of the efficacy of "talking points" is past, and that those special levers no longer possess their former power of persuasion in inducing sales. It is not necessary that the machine shall be fabricated of rare materials, put together under extraordinary conditions of shop administration, nor that it shall be accompanied by unusual "inducements" in the shape of free equipment or guarantee. The real essence of the successful marketing of a car lies in the manner in which its adaptibility to the wants of the individual owner may be demonstrated, and—to a surprising degree—to the success of the salesman in presenting his arguments in a brief and forceful style calculated to penetrate the haze of uncertainty which surrounds the prospective customer as a result of interviews with other salesmen.

It has been observed with increasing frequency that the task of selling automobiles constantly is becoming more difficult. In other words, the idea is growing that the personal equation of the salesman is becoming a more potent factor in the administration of the sales department. This being admittedly so, it is interesting to make observation of the various weapons with which the modern motor car salesman arms himself, or, in other words, to compare the selling points exploited by the different manufacturers in disposing of their wares.

With this object the Motor World wrote to a number of well-known American manufacturers who are members of the American Motor Car Manufacturers' Association, asking this question: "Wherein and in exactly what details does your car differ from others? In endeavoring to make sales, upon what points do you lay the most stress?

From the score and more of replies, the following excerpts have been taken:

Maxwell-Briscoe Motor Co.—"The principal differences between our product and that of other manufacturers are, moderate price, all-around utility and reliability in exacting service. In endeavoring to make sales, we point to past performances, arguing that the Maxwell, a car of moderate price, performs the same service as the higher priced competitor, is operated more economically, not liable to disorders on account of its constructional advantages, such as three-point suspension, thermo-syphon cooling, multiple disc clutch, unit construction, etc."

Nordyke & Marmon Co.—"The Marmon differs from most other cars on the market in that it is entirely of our own design and entirely of our own construction. The motor differs from others in its oiling system and this is one of the points upon which we lay the most stress. The rear axle, transmission and brake system differs from others, possessing certain superior features and especially the feature of easy access to the parts. We lay claim to easy riding qualities, due to our system of full elliptic springs and method of suspension. We lay claim to a superior steering gear and connections; to high class body construction and finish."

Pennsylvania Auto Motor Co.—"'Pennsylvania' cars do not materially differ from any other high-grade car. We, of course, have proven and feel that a hemispherical or valve in the head engine has many advantages over the standard types of inverted 'T' or 'L' head engines, since we get the explosion directly over the pistons, and get an absolute utilization of all the gas contents. The arrangement of the valves and cages in the head permit of the easy removal of foreign matter on the pistons and in the combustion chambers, without disturbing any conections whatever. We lubricate all of our motors internally through a hollow crank, by means of a mechanically driven mechanical lubricator. We do not in any way depend upon splash lubrication. We, like many others, use nickel steel throughout, and annular bearings. We have proven again that the unit axle and transmission system is not only practical but desirable. We also lay particular stress on the fact that we have in our factory as complete a line of modern jigs as there is in any factory in the world. This is interchangeability; and another very important thing, that there is not one part of the Pennsylvania car that is made on the piece-work plan. We have absolutely no piece-work in our factory, every man being on a salary."

Mitchell Motor Car Co.—"While there are, of course, numerous differences between our machines and those of other make, still, we use no particular feature that is not common to a great number. In other words, everything about our car is of approved design and according to the best general practice. If there is any one thing that has created sales for us more than any other and because of which we would naturally place stress upon it in selling, it would be the fact that our cars are more stoutly built than the average make and have a reputation for standing up in rough country and under hard service and of delivering a great amount of mileage with very little care."

The Dayton Motor Car Co.—"One point which is always emphasized, is the very large percentage of the entire make-up of the car being made in our own factory, under our direct supervision. Having direct supervision over the raw materials and all structural labor, 99 per cent. of the complete car, we believe is largely responsible for the success of the complete product. In taking under consideration the structural features of the Stoddard-Dayton, it must be borne in mind that all of these features as to principle, material and workmanship are identical in the three principal models, the only difference in these respective models being in the dimensions."

Points further enumerated are: Valve-in-the-head construction of motors, offset crank shafts and automatic, internal lubrication; the use of roller, thrust load bearings throughout the car in all transmission and axle mountings.

Brush Runabout Co.—"So far as we can inform ourselves, the Brush has the only single cylinder vertical engine operating in an automobile in the United States. The transmission is of the planetary type and

Digitized by Google

the only one in which multiple disc clutches are used on all three speeds. In making sales, reference is made to the transmission which is self-adjusting, having few wearing parts; also its simplicity, the light weight of the car (900 pounds), the ratio in which the car is geared, making it almost impossible to stall the engine on any grade or in traversing any road."

York Motor Car Co., Inc.—"Our cars differ in construction in many ways. The cylinders are cast separate, with wide ports or openings on each side, and they are put against each other with a light paper packing between, and held by bolts. This gives the advantage of a short engine—the same as the bloc system—each cylinder can be inspected individually, it is only necessary to remove one cylinder in case of replacement, and water pipe connections between the cylinders are eliminated, as the water enters at the rear and leaves at the front. Our integral oiling system in the base of the crank case is operated by a sliding vane pump, of which our point is that the oil level is controlled by an eccentric valve on the inside of the base with the stem running through to the outside and carrying a hand or pointer which registers on a dial by which more or less oil may be secured as desired. We believe this is the only integral oiling system, with practically micrometer adjustment.

"We also lay particular stress on the parts used in Pullman cars, as we do our own manufacturing in our plant, with the exception of the axles, and other articles as lamps, rims, etc. By making our complete car in our own factory, including our own wheels and body, we are able to give a better value than would be otherwise possible in a high grade car."

National Motor Vehicle Co.—"We use a double ignition system on all of our cars, of which the wiring is a feature. We use a crank case oiler of our own design, which is exceptionally efficient and which we think is entirely original with ourselves. We use ball-bearings on the crank shaft and cam shafts of all our cars and have been strong advocates of that type of construction for several seasons past. Our company was one of the very first to exploit that type of construction in this country. The rear system of National cars is another special feature. In general design it is not unlike several others, but the construction of the rear axle housing is such that all of the parts can be inspected, adjusted or removed without disturbing the wheels and without tearing down any other parts of the car. We use sheet aluminum or cast aluminum bodies on all of our cars and either type of construction is a feature as compared with ordinary sheet metal bodies."

A brief summary of the points upon which special stress is laid by other manufacturers follows:

Jackson Automobile Co.—Thermo-syphon water circulation, full-elliptic spring suspensions on all models, brake rods carried inside the frame, unit-power plant design with enclosed fly wheel and on the latest model overhead cam shaft, inclined valves placed in the cylinder heads, adjustable timing gears, special design of clutch linkage, and in a second new model standard magneto ignition.

Inter-State Automobile Co.—The use of a torsion tube which eliminates the use of all struts or torsion rods, complete double ignition with two sets of plugs, unusually large tires, and a complete equipment of accessories, calculated to relieve the retail buyer of any embarrassment in connection with the outfitting of his car.

American Motor Car Sales Co. (Overland)—Silent motor, exclusive design of planetary transmission enclosed completely and mounted as a unit with the live rear axle, absence of side levers and control of the speeds by means of two pedals, clutch adjustment without the use of tools other than a screwdriver, high tension magneto, complete equipment. In larger, four and six-cylinder models, special ball bearing change gear, and, in the latter, low price.

Oakland Motor Car Co.—Special design of two-cylinder vertical motor, with original balancing device and removable cylinder heads, thermo-syphon cooling, one pedal and one side lever in control system, small amount of attention required in connection with maintenance. On the new four-cylinder model, three-point suspension of motor, inclined alignment making lubrication effective as well as assuring straight line drive, epicyclic steering gear having slight differential action.

Reliable-Dayton Motor Car Co.—Direct application of the principles of ordinary motor car construction to the carriage type of vehicle, applied as requirements develop upon experimentation; absence of radical departures from commonly accepted practice, solid and enduring construction.

Ford Motor Co.—Vanadium steel employed in every part of the car, from lamp bracket to axle, magneto incorporated in engine design, block type motor with removable water jacketed cylinder heads, lower half of crank case made of pressed steel and extended to form seamless oil-tight housing and enclosing lower half of entire power plant, every bolt locked securely in place.

W. H. Kiblinger Co.—Air-cooled motor construction, with fan incorporated into fly wheel, special provision for cooling valve springs and preserving their temper, original method of chain adjustment, high road clearances, solid tires and light, graded, resilient springs, non-skidding advantages of high-wheel mounting, hill-climbing ability, general acessibility of mechanical parts.

Hart-Kraft Motor Co.—Exclusive use of unit power plant in 1,000-pound commercial car, all parts of mechanism accessible from driver's seat, simplicity of plant, assured reliability in service due to adoption of solid tires, improved ignition, simple mechanism and fool-proof construction.

The Bristol Engineering Co.—Interchangeability in any unit—that is to say, engine, transmission and rear axle constructions replaceable independently and readily—only two sizes of studs and nuts employed in assemblage, only two socket wrenches required in tool kit, hardening carried out in all small parts, left side control.

Most suggestive, as showing how it is possible to expand the complete selling platform from a single key-feature, was the reply received from the Atlas Motor Car Co., and embodying the radical claims which they make for their two-cycle engine. The name "Atlas perfected, two-cycle engine," is bracketed against the three claims for supremacy, that it is the "Simplest automobile engine built; the most flexible automobile engine built; and indestructible." Developments of these three claims explain that "No adjustment is necessary or possible, hence the easiest to care for"; that it "will throttle down lower and accelerate quicker than any other engine built, hence the easiest car built to handle"; and that "No engine parts replacements ever necessary, hence upkeep expense lowest of any automobile engine built. Will last longer than any other automobile engine and improves constantly by use instead of rapidly deteriorating after a few thousand miles use, like the four-cycle engine."

Investigating Radiator Efficiency.

By plotting curves from the results of an exhaustive series of tests, experimenters connected with the Bush Manufacturing Company, of Hartford, Conn., have obtained data concerning air cell and water space sizes in radiator practice calculated to show that it is desirable to make the air cells small and the water spaces thin, but the extension of the principle beyond a certain point results in a decrease of efficiency. The experiments made it clear that there is little to be gained by making the air cells smaller than one-fourth inch square, giving a one-sixteenth square inch area. Smaller than this, the air cells showed a lessened heat radiation in proportion to area.

The tests also included determinations of such points as air velocities at various car and fan speeds, the most efficient radiator thickness from front to back, the rate of water flow resulting from thermo-syphon effects, and the best practical proportions of air cell to water space sizes. The information thus obtained has been utilized in the construction of the Bush radiators which the company is now marketing. Vertical tubes with fins are employed, the tubes being flat and of small section. They are spaced three deep from front to back, while the rows of fins are separated by vertical strips, the fins being soldered to the strips to give strength. Many advantages are claimed for the vertical tube and fin type, particularly for a thermo-syphon system, since the water is given a free and unrestricted flow in a vertical line.

From the standpoint of racing events, the past year has been a notable one. It produced new records for various distances, brought to light a number of conspicuous drivers hitherto unknown, revived the famous Vanderbilt Cup contest, and inaugurated the now celebrated Grand Prize event in addition to various other features of minor interest. In connection with the return of the Vanderbilt race, one of the most noteworthy achievements of the year was the completion of the first section of the Long Island Motor Parkway, a cement course which is destined to play an important part in future speed events in America. Handicapped at the start by business depression, during which time many manufacturers were forced to curtail expense as far as possible, the year 1908 nevertheless has had a goodly quota of events and its racing season ended in a brilliant flourish at Savannah.

New York-Paris Race Starts.

The first race of 1908, which started on January 12, proved in many respects the most momentous as well as the longest of the year. It was 22,000 miles in length, and in order to complete it, the contestants were carried clear around the world. The New York to Paris contest created wide international interest, inasmuch as it was such a stupendous undertaking and generally declared at the outset, to be practically impossible. Few people ever thought that some nine months later two of the six starters would actually reach the French capital. Six contestants set out in the dead of winter on this wild expedition: the Thomas, representing America; a German, Prothos, an Italian, Zust, and three contestants representing France—Sizaire et Naudin, Moto Bloc and De Dion. Of these, the three former eventually reached Paris.

Florida's Annual Sandfest.

The first of the season's speed contests at reasonable distances, was the annual Ormond Beach (Fla.) meet, held March 3-6, under the auspices of the Automobile Club of America. As a sporting carnival it was a weak end to a long diminuendo, the only redeeming feature being that a few world's records were broken. Lack of sufficient entries resulted in lack of interest, and as there were no really exciting brushes or close finishes at any time, enthusiasm was almost an unknown quantity. On the first day of the meet, the late Emanuel Cedrino, driving the Fiat "Cyclone," won the initial 100 miles event for the Minneapolis trophy, driving much of the race minus two tires, when he could not make tubes stay on his front rims. His time was 1:50:20, but he fell short of the record made by Walter Clifford-Earp in 1906 by 35 minutes.

The second race on the same day, 150 miles for stock cars, was won by Louis J. Bergdoll, the Philadelphian, in his Benz, his time being 2:40:53.

If the opening day was disappointing, the second day was equally so, when the 125 miles event for "gentlemen drivers," also was placed to the credit of Bergdoll.

Cedrino Establishes a Record.

Thursday, March 5, the third effort, produced the best race of the meet, when Cedrino, in the Fiat, established a record for 256 miles and won the Automobile Club of America's trophy. His time for the distance was 3:21:27⅖, an average of 77 miles per hour. R. G. Kelsey, in the Christie car, was second in this evnt, while Maurice Bernin, who experienced tire trouble, was third with the Renault. Bernin, however, on the final day of the meet, won the 100 miles match race against S. B. Stevens in the Fiat Cyclone, and broke the world's record for the distance. His time was 1:12::56⅕, as against the mark of 1:15:40⅖ made by Clifford-Earp in the Napier in 1906.

On this occasion also, a number of mile trials against time were made; the fastest being that of Cedrino, who slid over a mile in 35 seconds flat. While the record of 0:28⅖, made by Marriott in the Stanley steamer two years before, was not touched, nevertheless a most notable performance was given by David Bruce-Brown, an amateur, who broke the old amateur record of 0.39, held by Wm. K. Vanderbilt, by covering a mile in 0:35⅕. Bernin made the next best time with the Renault in 0:39⅕.

No sooner was the meet over, than the indefatigable W. J. Morgan, who has been concerned in many southern ventures, immediately started his Jacksonville-Miami race, a personally conducted affair, in which four or five cars started. A 10 horsepower Cadillac, driven by Dr. W. N. Stinson, won this 371 miles race, C. F. Wheeler's Peerless also arriving, after it had been rescued by the winner, when stuck in a swamp 70 miles from the nearest town.

Savannah's First Road Race.

Some of those who attended the beach meet stopped over on their northbound trip at Savannah, which made its first attempt at holding a road race a few days later, on Wednesday, March 18, and the day following. A fine, smooth 18 miles circuit had been prepared for the occasion, the road well oiled and a grandstand erected. Inasmuch as the coals of the A. A. A.-A. C. A. fire were slowly kindling, and as the Ormond meet had proved a failure in many respects, under the A. C. A.'s management, the officials of the Three A's were particularly anxious to make Savannah's initial attempt a success, and in so far as the management of the affair was concerned, they were well rewarded for their pains. The first day upon which the 180 miles race for stock runabouts was run, and also the race at the same distance between two six-cylinder machines, a Stearns and a Thomas, proved a big disappointment to Savannah, as well as its visitors.

In the former, Herbert Lytle, at the wheel of an Apperson car, won in 3:35:41, beating J. B. Lorimer in the Thomas-Detroit, by more than a lap. A third starter, Zengle, in a Pennsylvania, broke a rear axle after making the fastest circuit of the race, in 18:54. In the race between the "sixes," George Salzman, in the Thomas, finished a lone race; Leland in the Stearns, breaking a connecting rod when the race was but half finished.

When Strang Achieved Fame.

The Savannahians on the following day however, saw a rattling good race. It was upon this occasion that Lewis Strang mounted in an Isotta car, rose to prominence by winning the race of 20 laps, a distance of 342 miles, in 6 hours 21 minutes 30 seconds—an average speed of 53.83 miles an hour. Close on Strang's heels in this contest was Herbert Lytle in a 50 horsepower Apperson, while Malcolm Newstetter.

Digitized by Google

Enthusiasm hit the top notch during this race, the Governor of the State, the Mayor of Savannah, and other distinguished guests, lending no little prestige to the occasion. Practically the entire city turned out to witness the contest and so satisfactory was the race generally that it was obvious that Savannah was at once encouraged to make a strong play for a still bigger race over its magnificent course.

Briarcliff and Its Sequel.

A little more than a month later, April 24, Strang won the Briarcliff road race in the same Isotta car. This contest, held on one of the most dangerous courses ever selected for a race, made up of a series of treacherous turns and choppy hills that were none too smooth, was a surprise to every one. Many well qualified to judge had predicted that accidents would be numerous and that in all probability more than one driver would come to a sad end. From start to finish, the contestants set up a pace that forced a race with death throughout the 259 miles, but the gods were kind and there were no fatalities or bad accidents. Strang's victory was clean-cut and decisive, especially notable in that he set out from fourth position, passed those ahead of him, took the lead early and was never headed. He sent the Italian car over the 8 laps in 5:14:13⅕, at an average speed of 48 miles an hour—a speed which astounded those who were familiar with the condition of the course. Emanuel Cedrino, in a Fiat, was second, while third and fourth places were captured by American drivers in American cars. Guy Vaughan, at the wheel of a Stearns, followed close upon Cedrino's heels, and Herbert Lytle, in the Apperson entry, was fourth. The Automobile Manufacturers' Committee, principally composed of Robert Lee Morrell and T. Francis Moore, who promoted the contest, were in difficulties from the very beginning in arranging things so that the contest could start. On the day before the race, State Engineer Skene demanded that the promoters put up $4,600 to go for road repairs necessitated by the race. Skene would not even take a bond on a reliable surety company, but insisted upon cash—and he got it. All that was ever returned to Morrell was a trifle over $500. A sequel to the incident is Morrell's suit against the State official, who, Morrell claims, had no right to exact the money.

Summer Contests and Tours.

Between Briarcliff time and the first of June, particularly on Decoration Day, there were numerous hill climbing contests, a couple of track meets, together with several short endurance and reliability runs, among them, the meet at Pimlico track on May 29, during practice for which Emanuel Cedrino met with the accident which caused his death. A 300 miles road race took place at Denver, Col., on May 30, and Linn Matthewson, the driver of the Thomas Forty entry won it, the bad road conditions being responsible for the slow average time of 38 miles per hour.

On June 5, the day before ground was broken in the construction of the Long Island Motor Parkway, a series of one mile speed trials took place at Jamaica, L. I. Twenty-six fast events were run off on the Hillside avenue course and road records at the mile and kilometer distances were shattered. The fastest performance of the afternoon, was that of Harry Kilpatrick in the Vanderbilt Cup Hotchkiss car. He scored a kilometer in 24⅖ seconds in the free-for-all, which was at a rate of 90 miles an hour, while his time for the mile was 0:38⅖—a rate of 93.3 miles. George Robertson, in the Fiat Cyclone, and numerous drivers in the stock car events, made creditable showings.

July 4 was celebrated with the usual number of local holiday events, track races taking place at Elkwood Park, Long Branch, N. J., Baltimore, Md., and other places throughout the country. The interest turned from racing toward the annual Glidden tour which started from Buffalo, N. Y., on July 9.

America Wins Race to Paris.

About a week after the tour ended, word was telegraphed from abroad that the Thomas car contestant in the New York-Paris race had reached the French capital on July 30, winning the great globe-circling contest by 26 days. Although it did not reach Paris first, it was declared the winner on a 30 days allowance for time lost in attempting to reach Asia via Alaska, a plan which had to be abandoned by the Thomas crew and which the other foreign contestants did not so much as venture upon. On Saturday, August 15, the victorious car reached New York once more and was given a most enthusiastic reception. Of the six original contestants in this race, only three ever reached Europe. The French Sizaire et Naudin retired after running only 100 miles two days after the start; the French Moto Bloc retired in Iowa after traveling 1,300 miles, while the third French entry, the De Dion got as far as Vladivostok, Siberia, before dropping out of sight. The German Prothos car, after having been rebuilt several times en route, succeeded in arriving at Paris first, four days ahead of the Thomas (then driven by George Schuster). Having been shipped by rail for a portion of the distance, the time allowance set the Prothos back to second place. Some weeks later, the Italian Zust entry arrived at the finish, after much difficulty.

Considerable interest was aroused over the Lowell, Mass., Labor Day road race, on September 7. Here it was that Lewis Strang scored his third triumph by piloting J. H. Tyson's Briarcliff Isotta to victory. In a field of seven starters, Strang took the lead in the very first lap and never relinquished it, driving the 24 laps, or 254 miles in 4 hours 42 minutes 35 seconds. Banking on Michelin tires, as he had done in his two previous victories at Savannah and Briarcliff, he had no tire trouble, a remarkable characteristic of his lucky driving in all three of these events. At Lowell, Strang beat his nearest competitor, H. F. Grant, in an American Locomotive, by more than 1½ hours. William Bourque, in a Knox, was third.

Two days previous to the Lowell event, a race meet took place at St. Paul, Minn., and Ralph De Palma's performance there was one that must not be overlooked. Driving the Fiat 'Cyclone" around the mile track in 51 seconds flat, he broke all world's records for the circular mile, lowering the 52 seconds mark held by Walter Christie and made on the same course.

The A. A. A. and A. C. A. War.

Around this time, the "flare-up" between the American Automobile Association and the Automobile Club of America was reaching serious proportions. How the failure of the former to recognize the Ostend rules in completing the arrangements for the forthcoming Vanderbilt race, how the club decided to hold a second and spite race under the international rules and especially for the foreign contingent, and how there came from the conflict the famous "treaty of peace" which gave to the A. C. A. the control of all "international" competitions, hardly need be recapitulated here. The organization of the Motor Racing Association, and its announcement that it was going to control local racing around New York City, and that it contemplated holding a 24 hours race at Brighton Beach, without asking a sanction of the A. A. A., caused a little flurry of excitement. The Motor Racing Association did hold its outlaw 24 hours race at Brighton on September 12, and Ralph Mulford and Harry Cobe alternating at the wheel of a Lozier car, won it. Then when, a few days later, the Three A's retired from the field and relinquished the control of international races to the A. C. A., the Motor Racing Association no longer wanted to play "outlaw," but desiring to run another 24 hours race on October 2 and 3, applied to the A. C. A. for an "international" sanction and got it.

It was in this twice-around-the-clock contest that George Robertson began his winning streak, when alternating with Frank Lescault at the wheel of a Simplex, he reeled off 1,177 miles, breaking all records for dirt tracks with a stock car. In this race the Lozier came in for second honors and the Thomas for third.

Opening of the Motor Parkway.

On Saturday, October 10, two big racing events occurred—the Long Island Sweepstakes, which served to open the new Motor Parkway, and the big road race in Fairmount Park, Philadelphia, under the Quaker City Motor Club's auspices. Herbert Lytle, in an Isotta, was the start of the

Digitized by Google

Sweepstakes event; winning the principal race, 234.6 miles in 3.39:10. Strang, driving a Renault, was a close second. Events for the lighter cars in the four other classes were won respectively by H. Hughes (Allen-Kingston); W. H. Sharp (Sharp-Arrow); W. R. Burns (Chalmers-Detroit), and Hugh Easter (Buick). This race gave some idea of what was to be expected in the way of speed at the Vanderbilt Cup contest on the 24th .

At the Philadelphia 200 miles race, which was the wind-up of the annual Founders' Week celebration, George Robertson in a stock Locomobile, won the chief laurels and lifted the $2,000 prize cup, when he got over the 25 laps in 4:02:30. Cyrus Patschke in a six-cylinder Acme, gained second honors, and Ralph Mulford, the Lozier pilot, third. This race, which was remarkable inasmuch as it was held in Fairmount Park, was so successfully run that it is expected to become part of the annual celebration at that city in the future.

Vanderbilt Cup Race Revives.

Then came the Vanderbilt Cup contest on October 24, which had been awaited for two long years and in it Robertson, driving the 1906 Locomobile Vanderbilt racer, added the third big victory to his string. Robertson drove a fast and exciting race, covering the eleven lapped circuit, a distance of 258.06 miles in 4 hours, 48⅕ seconds. Lytle, in an Isotta, drove in second, but was disqualified a couple of months later on account of the car being over weight. Second place would undoubtedly have been awarded to James Florida in the second Locomobile, had the race not been officially called off before he crossed the tape after colliding with a touring car at the finish.

Wagner Wins the Grand Prize.

As the climax of 1908 racing, came what was beyond all doubt, the biggest contest of the year—the Grand Prize race at Savannah. The memories of this notable contest promoted by the Automobile Club of America and the Savannah Automobile Club, are still fresh in mind. The international light car curtain raiser of the Georgia event was an interesting race, Hilliard in the little Lancia "Lampo," proving the victor in the 196 miles flyer over the special 9.8 miles course in 3 hours 43 minutes 43 seconds. When on the following day, Wagner, in the Italian Fiat, fought out the struggle for the Grand Prize with Hemery in the Benz, and the former won by the small margin of 56⅖ seconds, the throngs who witnessed the victory and the millions who read about it that night, were satisfied that the closing contest of the racing year was a notable one. Wagner's time for the 400.02 miles was 6:10:31⅗, a rate of 65.1 miles per hour—remarkable in view of the several hundred turns encountered on the winding course. Nazzaro, in another Fiat, followed Hemery into third place; Hanriot, in a Benz, was fourth, and Hautvast, mounted in a Bayard-Clement, fifth. The only regretable feature of the race was that the American entrants could not have made a better showing. Of these, Seymour, in the Simplex, who finished eleventh, made the best time. The fastest lap of the contest was made by Ralph De Palma, the American driver of the third Fiat entry, who covered the second and seventh rounds of the 25.13 miles course in 21:36.

Many Local Racemeets.

Throughout the year the distribution of local events throughout the country has been more uniform than ever before, the middle and western sections getting fully as good a share of contests as the East. How much of this has been due to the tireless activities of the ubiquitous Barney Oldfield, who with Walter Christie and Charles Searles has overlooked all previous announcements of retirement and steadfastly turned his face toward the fleshpots that hang within the precincts of county fairs, cannot be told. His movements have been often too rapid and abrupt to be overtaken by the pen of the chronicler. Be that as it may, it is perhaps significant of the widespread interest in automobile contests and of the tendencies in various localities that the last track meet of 1908 should have been held at Tanforan Park, San Francisco, Cal., and the last endurance contest, at Worcester, Mass., while New Year's Day is programmed for a 24 hours race at Ascot Park, Los Angeles, Cal., and the start of a two days' endurance run from Philadelphia, Pa., to Wilkes-Barre and return.

Twenty Entries for Quaker City Run.

That considerable interest is being taken in the Quaker City Motor Club's annual two days' endurance and reliability run, is evidenced by the fact that no less than 20 entries have been made. The contest to Wilkes-Barre and return, which is to start in the early hours of January 1, is to be a strict and exacting affair and not essentially a pleasure outing. The schedule to be maintained has been set at 20 miles per hour, although this may be reduced somewhat, on account of the difficult condition that will be encountered on the road, especially if the snow is at all deep. A rigid technical committee will endeavor to eliminate as many cars as possible from the "clean score" list when penalizations are warranted and the general opinion of those connected with the run is that the list of perfect contestants will be very small, when the cars return to Philadelphia on the following day.

The route starts out from the Club's headquarters on Broad street and is exactly the same as that of the Glidden tour last summer as far as Delaware Water Gap, then it branches off and runs to Stroudsburg, through the Poconos to Wilkes-Barre. The first control on the tour is to be at Sellersville, 33 miles out; the second is at Allentown, 54 miles from the starting point. From Allentown, where the checking station is at the Hotel Allen, the run goes straight through Bethlehem, Easton, Martin's Creek, Portland and the Delaware Water Gap to Stroudsburg, where the third control is at the Hotel Fulmer, 104 miles. From Stroudsburg to Wilkes-Barre one of the most beautiful parts of the whole tour is encountered and in parts the roads are splendid, there being 15 miles of State road through the Pocono Mountains, which is the finest on the run in the whole 300 miles. The run from Stroudsburg to Wilkes-Barre, the fourth control, is at once about as difficult and at the same time as pleasant as any part of the tour. In good weather the roads through this region are all that could be desired, but in the dead of winter they are very likely to be hard traveling, whether it is wet or dry.

The hardest and really the only dangerous section along the whole route is from Hazleton to Hamburg, a distance of 36 miles through roads so narrow that two cars cannot pass upon them in many long stretches. Should any contestants break down on this part of the route, a complete tie-up of the whole line is liable to result and a few of the drivers will doubtless wax petulant.

Briarcliff Racing Committee Organizes.

Another step was made in the troublesome practice of clearing the Briarcliff road race situation, when the racing committee met and elected permanent officers on Monday last, 28th inst. Percy Owen was made chairman and C. F. Wyckoff, who has been acting in this capacity temporarily, was elected vice-chairman. The Wagner-Field Company, composed of Fred J. Wagner and Russell Field, was appointed permanent secretary. In place of the suggested audit committee, a finance committee was chosen, consisting of three members—S. B. Bowman, J. S. Josephs and H. A. Lozier. Chairman Owen assisted greatly in electing himself, inasmuch as he, with E. Rand Hollander and H. A. Lozier, composed the nominating committee. Of the eleven members present at the meeting, seven are said to have announced that they would positively enter the race next May, for which a course is still wanted.

Women's Inter-City Run Postponed.

The Woman's Automobile Club, which so unexpectedly made its appearance a few days ago, near Columbus Circle, New York, did not engage in the heralded reliability run to Philadelphia and return on Tuesday and Wednesday last. The mere men who are engineering the affair decided that there was too much snow on the road for comfortable driving and in consequence postponed the event until January 11-12. Meanwhile, and in response to inquiries, the club's press bureau is authority for the statement that Mrs. Alice H. Ramsey was elected president of the club on December 11 and that other officials probably will be chosen this week.

FACTORS OF FIRST COST OF CARS

The Proportions in Which the Maker's Charges are Divided Up—Tires the Most Costly Element.

Various ideas are entertained by motorists and even by those directly connected with the trade, but more or less unfamiliar with the manufacturing end of the business as to how the first cost of a car is constituted and in what proportion the makers' charges are divided up. It is safe to say, however, that it would scarcely be expected that the item of tire cost would rise to as great a proportion as a fifth of the total original worth of the material embodied in the finished product. That such is the case, in foreign practice at least, is shown in a resume presented by the Autocar.

"As a majority of makes of motor cars are now being marketed at a normal value, and the buying public appear to be seeking after cheap cars rather than expensive ones, it may be interesting to classify the heads under which the total value of a motor car is made up," he remarks. "It should be noted that in the present instance the cost of experiments, tools, patterns, etc., necessary to establish the actual type of car supplied by a manufacturer, is not taken into consideration, but a model is dealt with the initial costs in the production of which have been written off by virtue of its standardization and popularity.

"On a powerful car, which has a small clientele, and, of course, a comparatively limited output, these items are of considerable importance. In the cost of a motor car one has to consider:

"The raw material.

"The workmanship.

"The genral expenses and normal profit of the manufacturers and retailers.

"The general expenses and normal profit made the following table showing for their principal type of car, viz., the 14 horsepower chainless, the cost of raw material and parts, which must be purchased before commencing to manufacture:

Parts	Per cent. of cost.
Tires	21.7
Steel	10.6
Aluminum castings	9.2
Axles	8.4
Rubber tubing, aprons, nuts, bolts, etc.	8.2
Magneto and fittings	8.2
Ball bearings	7.4
Radiator	5.4
Chassis	3.8
Bronze castings	3.4
Forgings	2.8
Springs	2.6
Cast iron	1.8
Steel tubing	1.5
Paint work	1.4
Lubricating materials	1.4
Wood work	1.2
	100.0

"From an examination of this table, one can deduce some very interesting points," the author continues. "The proportion of tire cost is somewhat astonishing, and it will therefore be realized that the first question to be taken into consideration is that of the weight of a car, this weight being the criterion of the initial cost of tires as well as of their upkeep afterwards. The second item of cost is steel. In a car of the 14 horsepower Germain type, 1,300 pounds of steel of various types and qualities in the rough are required. A penny saved in the cost of each pound would therefore reduce the cost by £ 8s. 4d. ($26.30). The price of steel can vary from a few pence per pound to 2s. (50 cents) and more per pound, and one can imagine what difference it can make in the cost of a car to use good or common steel.

"By replacing aluminum with cast steel or iron, a new economy would be realized, but again the important question of weight would intervene, and the economy would only be for the manufacturer.

"Then comes the front axle—a point on which rests the safety of the occupants of the car. A good axle costs anything up to £20 ($100), some racing axles costing £70 ($350) or more, whereas a cheap axle can be bought for £2 or £3 ($10 or $15). To all outward appearances they are identical, and nobody would be able to recognize the good one from the cheap one by mere inspection.

"An expensive magneto and a good radiator can be replaced by common and cheap types, but with this reduction in price there would be a proportional increase of possible breakdown.

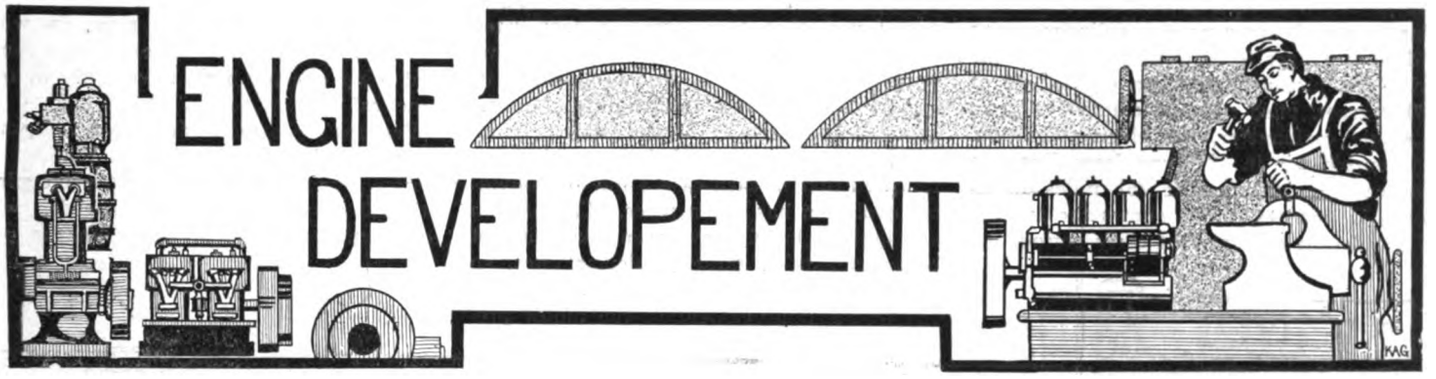
"The sundries and other parts come to a more moderate proportion, and certainly an economy could be realized on most of this material. After the material comes the cost of workmen's time in manufacturing. Of course, absolute standardization is presupposed, without which one cannot have a perfect motor car. With a well-equipped works, well-designed tools, and the cost of labor not excessive, the men's time expended on a chassis amounts to about 10 per cent. of its value.

"What is more expensive and important is the case-hardening and tempering, and then the necessary rectification of all the working parts. If these operations are not made, which is often the case in cheap cars, the machines at the beginning would certainly look identical, and the cheap one would run as well as, if not better and more silently than, a car more conscientiously made, but after a time all the soft moving parts would start to wear, and then the car would rapidly go to pieces, and it would be impossible to have it repaired. Case-hardening, tempering, and rectification are expensive operations, but they are the only guarantees against wear and tear.

"The general expenses, advertisement, and normal trade profit which then come add to the price of a car. There are generally in good firms in proprotion to amount of output, and are points which it is more difficult to account for. It is not surprising to find, therefore, that two cars absolutely identical to outward appearances, and running equally well, may vary in value and price up to about 40 per cent."

Weight of the Car's Equipment.

Some little time ago considerable stir was created abroad by the publication of an article showing the relative weights of various accessories and the way in which they were distributed about the average touring car. Up to this time, no effort has been made by the American manufacturers to show the corresponding figures for local practice, nor how with good judgment in design a properly and amply equipped car may be put out without being overloaded in this respect. Figures just issued by the George N. Pierce Co., as covering the standard practice in equipping their cars, however, reveal that the total equipment, including supplies totals 581 pounds, or more than the equivalent of two passengers' weight. This equipment, however, is more complete than the average, so that the total amount probably exceeds that found in ordinary practice.



Among the details of the equipment not always found in cars of stock construction are included the following, which form a regular part of the Pierce inventory: Shock absorbers, 28 pounds; odometer and fittings, 2 pounds; footrest, 7 pounds; robe rail and brackets, 5 pounds; dash cabinets, 3 pounds; luggage carrier in rear, 17 pounds; tool box in rear under frame, 26 pounds; sprag, 12 pounds; rubber bumpers, 5 pounds; rear axle straps, 2 pounds; gasolene gauge, 1 pound. Total, 124 pounds.

In addition to this with every Pierce Arrow is given tools and spare parts amounting to 55 pounds, making the total 179 pounds.

Aside from the actual mechanism and body of the car there are extras such as cape top, 138 pounds, and the glass front, 44 pounds that count in the actual weight of the car. Water, oil, gasolene and grease add another 220 pounds, making a total with the accessories of 581 pounds.

The ignition outfit of a Pierce Arrow adds a further element to the total weight. Two separate systems are used, a high tension magneto and storage batteries, working through two sets of spark plugs. The magneto system weighs 32 pounds and the battery system 70 pounds, or 102 pounds in all. While the battery system is a convenience, it could under certain circumstances be dispensed with and 70 pounds of weight saved. Aside from the mechanical parts of the car are the lamps, lamp-brackets and horn, weighing 87 pounds, which with the batteries make 157 pounds. This added to the total of 581 pounds for accessories and supplies give a total of 738 pounds of the total weight of the car in running condition.

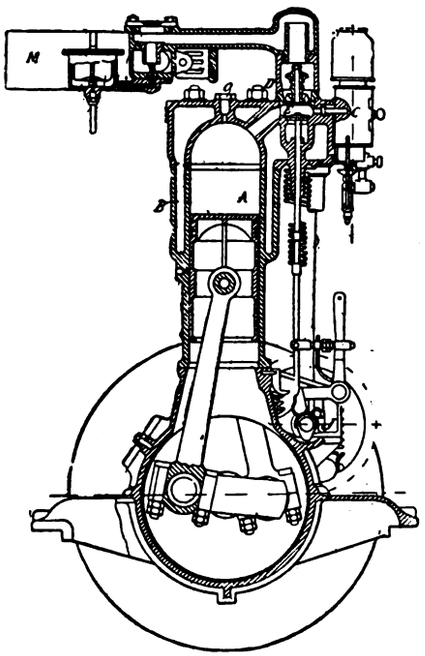
It is a long story, which tells the full history of the development of the internal combustion engine from its earliest beginning to the present day. But the most interesting and important portion of it is that which deals with the evolution of the type commonly known as the automobile motor. This is so because in that type is presented the lightest and most supple form of gas engine known, one which is capable of assuming varying loads under all sorts of service conditions and of doing so with fuels which though nominally uniform in quality actually vary not a little in thermal value and consistency.

Outwardly, the automobile engine may be said to have undergone but slight modification during the 24 years since Gottlieb Daimler produced the first really successful type of high speed motor. The present day types, working upon the same Otto cycle and possessing exactly the same organs actuated in almost exactly the same manner appear superficially, to reveal but slight marks of progress save that they are larger and that they manifest a higher degree of flexibility. That these two points involve the secret of automobile engine development, of course escapes the casual observer. As a matter of fact, practically all efforts at perfecting this type of engine have involved one of these two considerations. Questions of silence in operation, of reliability, of weight to power ratio, and of efficiency have been subordinated to them in the evolution of the automobile type of motor.

Daimler's original engine, which was patented in Germany on April 3, 1885, differed from the most prevalent of present types mainly in that it was air-cooled. This function was secured by surrounding the cylinder with a sleeve of thin metal, separated from it by a liberal air space, and directing a current of air upward through it by the aid of a fan attached to the crank case. Other characteristics of the motor may be observed from the accompanying illustration which shows that the inlet valve was automatic in action and that a certain amount of air was admitted to the cylinder during the suction stroke through a supplementary valve mounted in the piston and admitting air through the crank case. This feature has since become obsolete along with the method of valve actuation and of governing. The exhaust valve, it will be observed, was operated by a feather carried on the lower end of the tappet rod and traveling in a cam groove cut in the face of one of the two enclosed fly wheels. Governing was secured by causing the feather to travel in an approximately circular path during one or more cycles, thus preventing the exhaust valve from opening. The later

EARLY DAIMLER MOTOR

Daimler engines differed in this point, a small trip lever being made to cause the tappet to miss engagement with the valve stem when governing was required, the action otherwise being the same. Though this motor had but one cylinder, a later type had two, placed at an angle and thus constituting the first example of "V" construction.



Although Daimler's service to the industry in embryo was a useful one, and he is beyond a doubt entitled to all the credit which he commonly receives as the "Father of the Automobile," one of his early associates, William Maybach, also is entitled to no small share of credit for the development of the float feed and spray principle of carburation. Daimler's method of carburetting the charge for his engine had been to draw a certain amount of air up through a quantity of the liquid fuel thus gassifying and carburetting it by actual contact. But his bubbling or filtering carburetter failed to produce wholly successful results. Maybach introduced the method of float regulation of the supply now in constant and successful use, as a means of accomplishing a direct atomization of the fuel by injecting it into a current of air. Crude as was his first attempt, the present day carburetters, with perhaps one exception, in the case of the so-called "puddle" type, follow its lead.

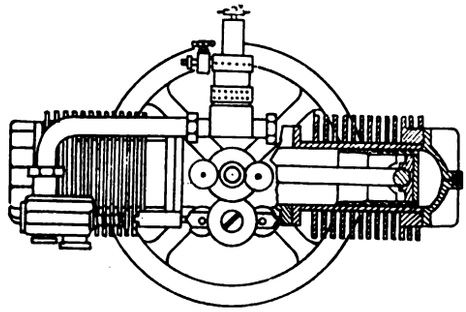
In the early types of Phoenix-Daimler engines, which were made by the firm of Panhard and Lavassor under license from Daimler's company, considerable strides were made. The two-cylinder type was an early feature, following the plan of Daimler's second attempt at cylinder multiplication with the cylinders parallel and acting on a 180° crank. Here, water cooling, the spherical combustion chamber, the exhaust cutout governor and a number of other features were improved upon until the motor became practically what it has remained ever since with four noteworthy exceptions. The Maybach carburetter was supplanted by the Phoenix and later by the Longuemere, the exhaust governor was reluctantly abolished in favor of the throttle type, hot tube ignition gave way to the electric spark, and finally, mechanical inlet valves were adopted. It is a remarkable fact, however, that despite the retention of some of these features long after other constructors had given them up, the Panhard motors, many of them ten or a dozen years old, continue in service to-day, and on a basis of piston displacement, continue to compare favorably with many others of more modern attainments.

Significant as being the prototype of a number of successful engines of later date, and, indeed, of the entire type which up to within four or five years was considered distinctly the American style of engine formation, the construction of the Henroid

Digitized by Google

motor should be considered. As shown in the picture it is seen to consist of the regular opposed arrangement cylinders with radiating flanges formed integrally with the cylinders, pistons acting on cranks set at 180 degrees, push rod and cam valve gear, a single carburetter, the electric ignition. A Henroid car in 1899 ran from Paris to Bordeaux, a distance of 351 miles in 19 hours 15 minutes, which shows the success of the design even at that early period.

PHOENIX-DAIMLER MOTOR

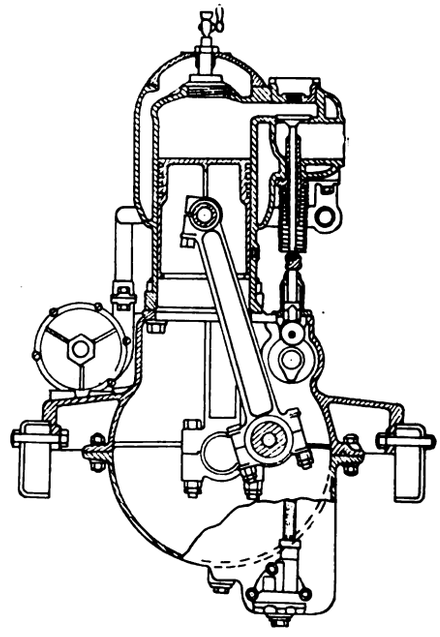


Paralleling the development of the Panhard motor, which must be considered in many respects the first milestone in automobile development, a number of other constructors were at work upon engines which later achieved more or less prominence in the foreign field. Carl Benz, in the same year as Daimler, patented his first gasolene-driven motorcycle. His later activities were carried out contemporaneously with those of Peugeot, De Dion and Mors.

In America, practical automobile motors did not begin to materialize until the early 90's, when, in 1893, Elwood Haynes first commenced work on the automobile idea, which in 1894 was crystalized in his first car, built for him by the Apperson Brothers, and graced by a single-cylinder vertical two-cycle motor of 1 horsepower. The following year, 1895, was marked by the appearance of the first double-opposed automobile motor, built by the Appersons; the appearance of the first car built by Charles E. Duryea, and by the granting of the Selden Patent, which since has figured so largely in the industry.

Without attempting to trace further the progress of evolution from the standpoint of the pioneers and their efforts individually, it may be sufficient to follow roughly the steps which were taken in arriving at the perfection of the present types. In studying the numerous difficulties encountered by the experimenters of the later 80's it was found that they readily segregated themselves into such shortcomings as improper carburation, improper ignition, irregular torque and inflexibility. Consequently, and because of the extremely involved nature of each of these problems, it followed that in each case a line of individual evolution has taken place. Carburation and ignition laterly have been taken care of by specialists in these particular lines, so that the engine designer himself has been left to the improvement of the motor proper, while the organs in question have come to be regarded as auxiliaries.

From the bubbling carburetter through the various types of surface vaporizer in which gasification was induced by ordinary evaporation, to the first of the spray types was a big step progressively. But it soon was learned that the mere spraying of the liquid fuel into a stream of air on its way to the engine was not all that was required. The proportions of gas and air must be very delicately adjusted, it was found. Furthermore, it developed that the proportions must be varied in accordance with different operating conditions in the engine, such as differences in load, speed, and even in accordance with varying atmospheric conditions, to a limited extent. Hence the appearance of various methods of compensation, as it came to be known, by means of which the natural tendencies to unsatisfactory working of the simple jet were counteracted with greater or less success. It was not until 1903, however, that Arthur Krebs invented and patented the diaphragm system of regulation which proved so successful.



In this connection it may be observed that no part of the motor has undergone a wider variety of experiment than the carburetter. Countless methods of regulation have been tried and many ingenious systems of construction attempted in an effort

HENROID MOTOR

to secure the delivery of a uniform quality of gas irrespective of running conditions. The float regulated spray or jet always has proved the most popular. Its regulation has been accomplished automatically and by means of the varying suction or by the varying pressure of the water circulating through the coiling system, by means of fly-ball governors manually or by fixed adjustment according to the theories of the experimenter. One of its most interesting forms is the multiple jet type, in which the idea of a little carburetter for low speeds and a big one for high, is carried out on a practical scale.

Perhaps the most significant development of recent date in this line is that of the puddle type, in which the jet principle is utilized only at very high speeds, while for starting and at low speeds what is practically a reversion to the old surface type is employed. As used in several different instruments, it has proved remarkably effective with the advantage very unusual in carburetters, that it renders starting easy and certain without the necessity of resorting to excessive "flooding," throttling of the air supply or otherwise upsetting the regular action of the device.

MODERN AMERICAN TYPE

Turning to the subject of ignition, the trials of the early experimenters with hot tube and flame devices contrast oddly with the successes of modern ignition specialists, though the former had the unquestionable advantage of simplicity in their favor. The complexities of the modern systems, however, lie more on the side of theory than of practice as known to the motorist who, where the modern, high tension type of magneto is employed rarely has occasion to remember what ignition is, whereas the hardy motorists of earlier days were required to be expert electricians before they could begin even to keep their machines in running trim.

The plain spark coil of the Rhumkorf type together with mechanical make and break on the primary circuit were employed in the earlier systems, improvements in the shape of vibrator coils, storage batteries, the transient dynamo, and finally the magneto, being introduced in turn. Methods of wir-

Digitized by Google

ing, the development of the industry of spark plug production and finally the simplification of the magneto systems have combined to do away with the old ignition difficulties very largely. The make and break system, though not as generally employed to-day as it was at one time predicted it would be, still possesses a number of staunch adherents and yields a degree of reliability in service which is remarkable.

In connection with the obvious need of higher powers, it early became evident that the desideratum of increased flexibility in the motor might be obtained to a degree at least, by increasing the number of cylinders. Improvements in carburation and ignition brought about changes for the better, but not until the four-cylinder and later the six-cylinder motor came into use, did the ideal of flexibility begin to be attained in any really notable degree.

Coincident with these developments the motor proper was undergoing wonderful changes of the sort which, for the most part make little or no appeal to the eye. The position of the spark plugs, the arrangement of the valves, the shape of the combination chamber, relation of bore to stroke, rate of piston speed, design of the crank shaft and fly wheel, and even the design and arrangement of the valve gear, all represent problems which have had to be studied out in detail, and largely with the aid of actual experiment.

In this connection, the importance of the improvements in lubrication cannot be emphasized too strongly. From the old, simple method of splash lubrication, or, in the case of the early Daimler motor, the use of an oil well into which the lower end of the piston dipped at each stroke, down through the various intermediate steps to the most highly developed and expensive form in use to-day in which the oil is circulated through the hollow crank shaft to the various bearings under regulated pressure, is a long stride.

Methods of cooling both by air and water have been wrought out with the same degree of patience which has been employed in every other case, the transition from the early chain driven pumps to the centrifugal gear driven devices of the present day being only one instance of the progress which has been made. The use of new and improved materials of construction, the readjustment of the bearings, fittings and methods of mounting which have followed in their train; the adoption of methods of interchangeable production with their structural benefits as well as their economies; and the establishment of fixed ideas as to the proper relation between the weight of the vehicle to be propelled and the power of the motor as a result of which the average motor no longer is apt to be overtaxed, all have combined to produce the old-time requirement of reliability, silence and durability in service, which for a while seemed actually unattainable to a really practical degree.

HOW SPRINGS NEUTRALIZE SHOCK

Principles that Affect the Suspension System—Their Operation in Distributing Stresses of Motion.

Though it is sometimes charged that even automobile designers as a class know very little about spring design, and are forced to rely upon the superior technical knowledge of the spring maker himself in securing for their machines the proper sort of equipment, it is equally true, if less commonly recognized, that the average user

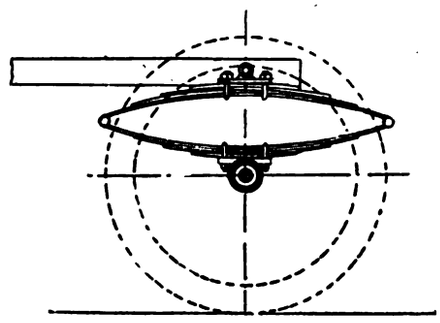


Fig. 1

has but small comprehension of what the requirements of the spring suspension are, even in the most elementary degree. It is probably true that of the many thousands of users who are constantly familiar with the action of the springs, only a small proportion actually understand how the suspension acts in distributing the stresses which exist between the body and the wheels, and between the body and the

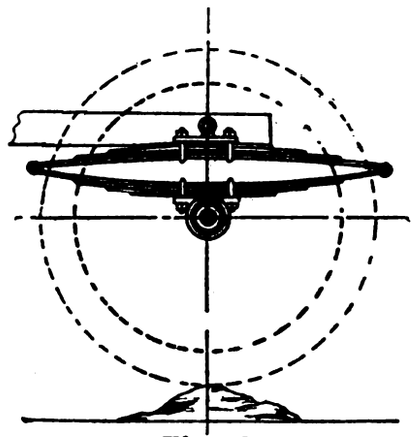

Fig. 2

ground. In condensed and primer form, the Co-Operator, which is the periodical exponent of the Maxwell-Briscoe Motor Co., explains what these actions and reactions are, and how they are absorbed by some of the various types of suspension in common use.

"It is a common error to suppose that the spring serves merely the purpose of absorbing the shocks coming from the load above the wheels," remarks the authority in question. "It is just as effectual in neutralizing the shocks coming from the running gear and forms, in fact, a common center in which the jolting produced by the inequalities of the road surface find their adjustment.

"The springs of a vehicle moving along on a level road will be, as shown in Fig. 1, the amount of compression being proportionate to the load carried. If the inequalities of the road be only slight the opening and closing of the springs will compensate for the bumps and hollows and the load will travel substantially in a straight line. When a bump is encountered, however, the inertia of the load will resist the tendency of the vehicle to raise the load and this force expended in altering the vehicle's motion causes the spring to close with a consequent absorption of the shock that otherwise would be imparted to the vehicle.

"Fig. 2 illustrates how the closing of the spring practically permits the load to travel in the same horizontal direction as before, a result brought about by the compensating action of the spring that has absorbed the rise of the wheel in mounting a road obstruction.

"Any material that is highly elastic—capable of considerable distortion upon application of force, and certain to return to its original form upon being relieved of the influence of the force that distorted it—is suitable for spring construction.

"Tempered steel, being the most elastic of all metals, furnishes the most suitable material for automobile springs and is practically the only metal used for this purpose. The spring almost universally used in automobile construction is the so-called laminated spring, consisting of several thin laminae, leaves or blades which are fastened at their middle to the axle and support the vehicle at their ends. As a rule the longest of the leaves is fastened to the vehicle, while a plurality of successively shorter leaves are used to reinforce the longest leaf as the flexion increases. The commonest form of automobile spring, one that is used also extensively in railroad construction and in horse-drawn transportation is the half-elliptic spring shown in Fig. 3. As a rule the axle is attached to the center of the spring and the load is carried on the two ends. When made of proper material this spring gives most satisfactory results, combining flexibility with sufficient rigidity to transform road shocks into a soft, undulating motion.

"The inverted half-elliptic spring is illustrated in Fig. 4. Used on motor trucks and on touring cars of more than ordinary weight it is generally utilized in combination with other springs.

The full- elliptic spring—Fig. 5—is used more extensively in horse-drawn vehicles and on runabouts of light weight, where in view of the lighter loads carried it gives excellent service. Though the full-elliptic

Digitized by Google

spring has a greater range of motion than the half-elliptic spring it is considered of less value in railroad service and on heavier automobiles, chiefly on account of the unavoidable lateral motion that causes the load to rock from side to side.

"In Fig. 6 is shown the three-quarter-elliptic spring which constitutes simply a half-elliptic spring with a quarter-elliptic spring supporting it, the latter taking the place of the more customary spring horn.

"Well designed springs . . . . . are built up of thin, broad leaves, of a number that is sufficient to give ample strength. Besides the length between the points of attachment, the number of the leaves and their width, thickness, and the quality of

Fig. 3

the steel determine the efficiency of a spring as a shock equalizer. It is easy to see that thin leaves will bend and return to their former shape more readily than thick leaves; for this reason it is customary to multiply the number of leaves rather than to increase the thickness of the individual blades.

"The curvature of the spring leaves should be the arc of a circle, since in this manner the longer and shorter leaves will

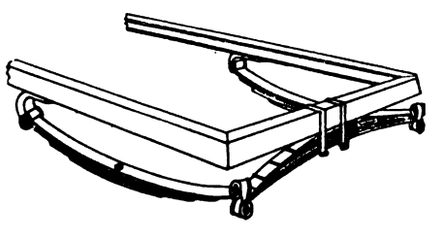

Fig. 4

fit closely upon one another and bend in either direction without leaving gaps between any two leaves. If such gaps are left the different leaves do not remain in contact throughout their full length and the danger of breakage will be imminent. A half-elliptic spring of faulty design is shown, extended, in Fig. 7, where the unequal curvature of the leaves will be seen.

"To prevent the leaves from separating in case of toss, clips are passed over them, as is seen in Fig. 8, and a bolt is passed through the center of all the leaves, not as a means of fastening the spring to the axle, but to prevent the laminae from sliding away from each other.

"Since when the wheel passes over an obstruction the rise of the axle necessarily lengthens the springs the latter are fastened to the frame by means of shackles. . . . . If, for instance, a spring fastened in the manner shown in Fig. 9, straightens out on mounting an obstruction it is inevitable that the load is thrown upward, while on the other hand if the shackles work under the ends of the spring any jolt imparted to the wheels causes the load to fall, with a consequent reduction in the loss of mechanical energy. . . . .

"A properly designed spring is the result of much experimenting, it being im-

Fig. 5

possible to use the same kind of spring on cars differing in weight, wheelbase and other features. Even with all these factors settled it is no easy matter to construct a spring that will support a vehicle and ride as well with one or two passengers as it will with the full quota of five occupants.

"Like many other parts of the automobile the spring comes in for its fair share

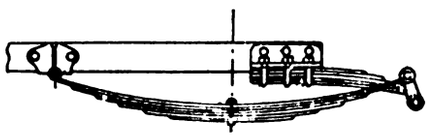

Fig. 6

of abuse, and many breakages of springs might be avoided could the driver be prevailed upon to pass over holes, ruts and ditches at a somewhat slower gait than is often done. As a general rule a spring does not break because the weight of the car bears down upon it with too great a force, but it gives way on the rebound, when the segments of the springs become

Fig. 7

separated and cease to support one another—a condition illustrated in Fig. 7."

One frequent cause of breakage of springs, the article goes on to recite, arises from the neglect of owners to look over their spring clips occasionally and draw up the nuts which hold them upon their beds. Any relaxation of the tension of these nuts, must result in the loosening of the binding

Fig. 8

which they exert upon the spring centers bringing about a tendency for them to bend upward as shown to an exagerated extent in Fig. 10. Frequent inspection of all the spring fittings, of course, tends to eliminate any and all troubles which might emanate from this or kindred sources.

"In a well balanced automobile," the article concludes, "it is necessary that the springs be mated, that is of nearly equal resiliency all around. Yet is it Maxwell practice to have the right hand springs just a trifle stiffer than those supporting the left side. The practicality of this scheme is seen in the fact that tools, extra tires and other accessories usually are carried on the right side of the car. The right side also carries the weight of the driver when the car travels without passengers and proper balance is restored by selecting slightly stiffer springs for the right side.

"To judge the efficiency of springs by

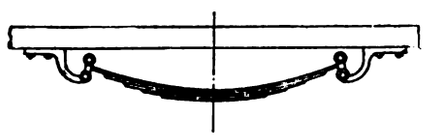

Fig. 9

guess work or crude means is impossible. In consequence Maxwell springs are tested by a novel contrivance designed by J. D. Maxwell for the purpose. This machine . . . . consists of a rectangular platform bearing inverted spring hangers. The shackles bear upon knife edges instead of upon the usual bolts. In the testing of springs the platform is raised by hydraulic pressure until the spring is opened a certain pre-determined distance. At this distance the pressure which is read on the graduated scale beam, must conform to a

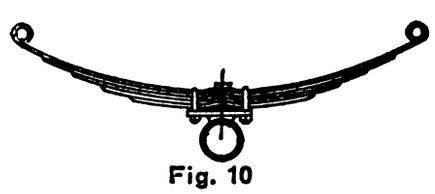

Fig. 10

certain standard with regard to each car. For instance, the springs used on the four-cylinder 30 horsepower model "D" are opened 3 inches while supporting a load of approximately 650 pounds."

Squeaks Call for Investigation.

Squeaks should be avoided in cars of all sizes, types and vintages, but most of all in new cars, and whenever encountered, should be followed out to their source and stopped with religious zeal. As a matter of fact the squeaks which are most apt to develop in new cars are those which come from parts which are stiff from being newly assembled and painted, arising mostly from reluctant springs and joints which are not properly secured. At the same time, they are as needless as they are annoying, and as they sometimes point to errors in construction, they should be traced out at once. Squeaks in cars which have been used for some little time always are important to locate and eradicate, as they arise from parts which are in need of lubrication.

WASHINGTON WANTS GOOD ROADS

Movement to Amend the State Constitution to Permit Issue of Bonds—$20,000,000 the Sum to be Named.

Members of the legislative committee of the State Good Roads Association of Washington are planning to submit a proposition to the Legislature to amend the Constitution, authorizing the State to issue bonds of $20,000,000 for State highway improvement. The purpose is to complete as rapidly as possible the various road projects now under way. If the bond issue meets with opposition the Legislature will be urged to increase the levy for the highway fund to one mill.

When the Highway Commission was created a public highway fund was established to be kept up by a direct tax levy, the levy being fixed at one-fourth of a mill. The last Legislature increased this to one-half a mill, and a revenue of $132,553 for 1907 and $286,536 for 1908 resulted from this scurce. The estimated revenue for 1909 is $374,296. From this amount the last Legislature appropriated $225,000 for State roads, and it is estimated that this sum will hardly be sufficient to complete the contracts alread let, although there will be but a small deficiency. The State now has 13 road projects.

Under the present plan of making appropriations it would take 24 years to complete the road work on the surveys which have already been made, without considering improvements and repairs. It is also estimated that if the $20,000,000 bond issue were made it is doubtful if it could be expended judiciously in much less time.

Chauffeur Becomes a Legislator.

Just how a chauffeur, who is privileged to make his own laws to some extent, will act in the matter of speed control and good roads legislation, remains to be seen when Representative "Tom" Davis takes his seat in the Massachusetts Legislature on the first of the year. Davis was formerly employed by the Matheson Automobile Company as a tester and in other capacities and later went with a private family as a chauffeur. Not long ago he quit work to make an effort at breaking into the Legislature and was beaten the first time he ran for office, two years ago, by 40 votes. This election he threw in his high speed and won handily in the stretch. For the past 16 years he has been a resident of Holyoke, which city he will represent.

Detroit Proposes to Limit Light.

In Detroit, Mich., the common council is wrestling with a proposed ordinance limiting the candle power of motor car headlights. At just what degree a light shall be declared illegally luminous and blinding to other occupants of the city's highways, is the point that is puzzling the aldermen, and the corporation counsel is conducting a number of experiments with several makes and models of lamps to ascertain just how much candle power they develop. In view of the fact that the ordinance provides for a fine not to exceed $500 or imprisonment for not more than six months, as a penalty for each violation, just where to draw the line is an important feature.

Bridge Roadway for Automobiles.

In view of the fact that the new Queensboro Bridge across the East River will soon be the chief route of New York automobilists touring Long Island, it has been decided by Commissioners of Bridges, to set aside, if possible, a section of the structure for the exclusive use of automobiles. A change in the plans has been proposed, so that the two trolley tracks now on the lower deck of the span will be removed to the upper thoroughfare, to make room for a motorists' right of way. If the change can be accomplished, it will prove a boon to the many owners of automobiles, who, at present, have to be content with slow passage on ferry boats, or else risk blocks and delays on the Brooklyn and Williamsburg bridges, in order to reach, in roundabout manner, the smooth touring country of Long Island, or the Motor Parkway.

Hartford Forbids Parking in Streets.

Under a new ruling of the Hartford (Conn.) police department, automobile owners must "hire a hall" or rent a garage in which to keep their motor cars while attending the theater. No more free parking space is to be allowed along Prospect street, upon which many theater patrons used to leave their cars between the hours of 8 and 11 p. m. The police department held that the partial obstruction of lines of cars on each side of the street, was dangerous in case of fire, as it tended to retard the passage of fire apparatus.

Imposes Road Tax Upon Himself.

A strange case of enlargement of the motorist heart has been reported in Belmont, Mass. Henry O. Underwood, a resident of that place, sent a check for $100 to the town treasurer for damage done to the roads in that section by the donor's large automobile. The act was wholly voluntary and is without precedent in New England history. However, the local authorities are not sanguine enough to hope that this will become a general or regular custom among the resident motorists.

Memphis to Have Taximeter Cabs.

The Business Men's Club, of Memphis, Tenn., through its industrial department, is backing a company to operate taximeter cabs in that city. Representatives from various makers have appeared before the club, and a selection of ten machines has been made.

NEW JERSEY AFTER BETTER LAW

Active Canvass in Progress to Obtain Views of Motorists—Committee Appointed to Frame Amendments.

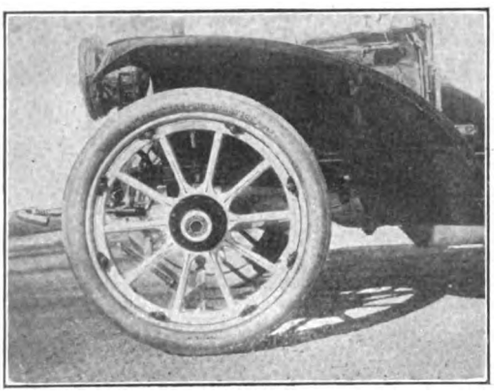
With the avowed intention of checking the activities of Joseph Frelinghuysen, resident of New York State, and Senator in New Jersey, and also to deal his miserable automobile law a crushing blow, the New Jersey Automobile and Motor Club, in common with the local trade association, has taken active steps toward securing a less repressive measure during the forthcoming legislative session. An active canvass among motorists is to be instituted at once for the purpose of obtaining their views, which data will be used in framing the new amendments that are destined to take the place of the many bad and objectionable features of the Frelinghuysen law. At a special meeting of the club, held last week, a special committee was appointed to investigate existing conditions and make a report in time to present the proposed amendments in the Legislature next month. The committee consists of Richard C. Jenkinson, George H. Simonds, Joseph H. Wood, W. C. Crosby, H. D. Bowman and W. B. Kinney.

Want the Punishment to Fit the Crime.

The fact that a number of automobiles have been stolen in Milwaukee, Kenosha and other Wisconsin cities, has led the motorists of Racine to demand a more drastic law in regard to thefts of this sort. Many owners of cars favor putting this crime in the same class with horse stealing, for which the penalty in that State is by no means light. Owners think that inasmuch as a motor car is worth several times the value of a horse and that as the maximum penalty for horse stealing is 15 years, the maximum penalty for purloining a car should be more than 5 years.

Satterfield Head of Buffalo Club.

More than 400 members of the Automobile Club of Buffalo, N. Y., attended the annual smoker and election of the organization on Tuesday last, 22nd inst., and elected the following officers for 1909:



President, John M. Satterfield; vice-president, Laurens H. Enos; treasurer, Harry Thorpe Vars; secretary, Dal H. Lewis; directors, Edward H. Butler, E. R. Thomas, George C. Diehl, J. N. Byers, Maurice M. Wall and George P. Urban.

Lower License Fee for Cabs Wanted.

A petition for a rudection in the licenses required for taximeter cabs has been made to the city council by the Los Angeles Taxicab Co. The present fee is $5 per month, which the company asks to be lowered to $1 per month.

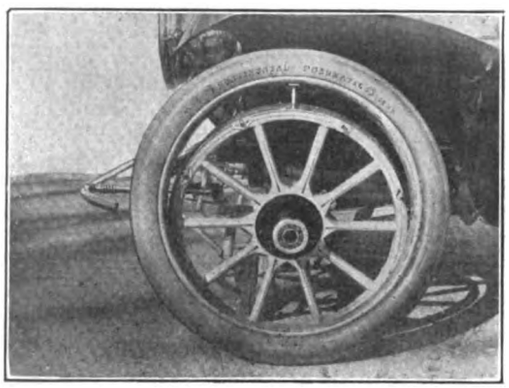
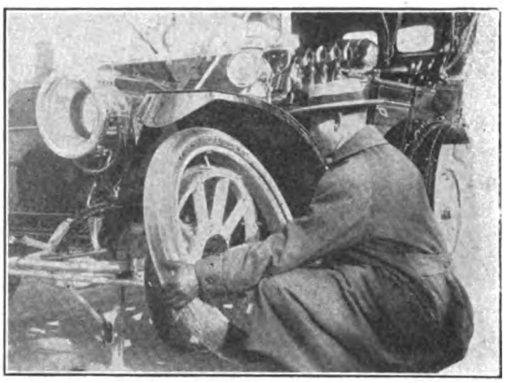
Continental Ready-Flated Tires

1—Ready-Flated Tire in Position on Wheel

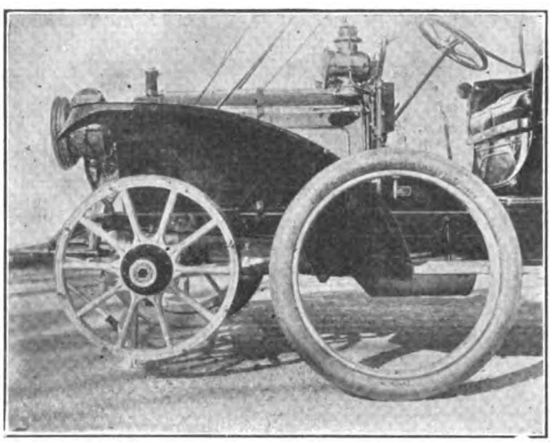


Permit the carrying of tires already

INFLATED ON SPARE RIMS



Reduce tire expense and make motoring a pleasure



5—The Finishing Touch

2—Ready-Flated Tire Partly Removed

4—Placing Ready-Flated Tire on Wheel

3—Wheel Fitted to Receive Continental Tire—"Ready-Flated"

Continental Ready-Flated Tires

THESE **popular** tires with **Continental Demountable Rims** will be **exhibited** at **both New York Auto Shows. Every** car manufacturer in America recommends them as the **most** perfect and **economical** tire equipment when the carrying of **spare tires, already inflated** is desired. **Cheerfully demonstrated at all of our sales offices and orders filled three days trom time wheels are delivered.** We know **you** will **want** them on **your new** car and to avoid delay **you must specify early. Many** present motorists are already "wise"—with them the **fear of tire troubles is a thing of the past. Remember one investment only** covers **all** expense—and **any clincher tire** and standard tube **will** fit. Our beautiful brochure "Continental Ready-Flated Tires" forwarded at your request.

CONTINENTAL CAOUTCHOUC COMPANY

Home Office: 1788-90 Broadway, New York. **J. M. GILBERT, Gen'l Mgr.**

Branches: Detroit, 226 Jefferson Avenue, San Francisco, 422-4 Van Ness Avenue.

The Week's Patents.

899,699. Wheel for Vehicles. William D. McNaul, Toledo, Ohio. Filed April 29, 1907. Srial No. 871,005.

1. A cushion wheel for vehicles comprising an inner and an outer felly, a plurality of chairs on one of the fellies and a plurality of substantially V shaped flexible sections, each having its ends secured in adjoining chairs together with the ends of the adjoining sections, and having its middle portion secured to the opposite felly.

899,708. Connection for Electric Conductors. Frank H. Ball, North Plainfield, N. J. Filed Aug. 6, 1906. Serial No. 329,-357.

1. A connection for electric conductors comprising an electric conductor; a spring clamp having jaws actuated by the clamp to detachably engage the conductor with a spring pressed contact; and a second conductor clamped and permanently held by the jaws of the clamp in position to receive greater pressure from the jaws as the clamp is placed in engagement with the first conductor.

899,770. Ignition Systm for Explosion Engines. Richard Varley, Englewood, N. J., assignor to Varley Duplex Magnet Company, a Corporation of New Jersey. Filed Nov. 8, 1907. Serial No. 401,191.

1. In an ignition system having a prinary circuit, a circuit controller having a plurality of contacts of different angular extent and located in different transverse planes, a continuously rotating shaft having metallic plungers in different planes corresponding to said contacts and equiangularly spaced apart, said plungers being spring-pressed radially outward and all grounded on said shaft, and a switch for putting one or any number of said contacts simultaneously into said circuit, the initial engagement of said contacts and said plungers occurring simultaneously when more than one is in the circuit.

899,809. Acetylene Gas Generator. Edwin M. Rosenbluth, Philadelphia, Pa. Filed Jan. 24, 1907. Serial No. 353,805.

1. An acetylene gas generator bracket, comprising a condenser in unitary relation therewith, detachably connected in rotatable relation with the generator, having a separate inlet and outlet for the gas and a drip outlet for the condensate, substantially as set forth.

899,822. Clutch. Heinrich Ast, Vienna, Austria-Hungary, assignor to The Firm of Vulkan Maschinefarbiks-Actien-Gesellschaft, Vienna, Austria-Hungary. Filed June 15, 1906. Serial No. 321,868.

1. In electric magnetic clutches: a shaft, a clutch member fixed thereon; a loose clutch member; a running sleeve free to turn upon said shaft and of greater length than said loose clutch member, and connected thereto in such a manner as to allow the latter only longitudinal motion with respect to the former; a collar on said running sleeve; and means exerting a yielding pressure between said collar and said loose clutch member.

899,856. Convertible Pneumatic Tire Rim. Erle K. Baker, Chicago, Ill., assignor of one half to Charles Gilbert Hawley, Chicago, Ill. Filed July 27, 1906. Serial No. 328,052.

1. A clencher rim having a removable flange and a filled ring adapted to fill the space in one of said flanges and extending above or beyond the edge thereof to protect a non-clencher tire from said edge, substantially as described.

899,876. Automobile Wheel. Joseph Laus, Jr., Oshkosh, Wis. Filed March 11, 1908. Serial No. 420,308.

In a device as set forth, a hub, an axle stub or spindle therefor, an interior spool shaped hub member positioned rotatably immovable adjacent to and upon said spindle, a pneumatic cushion extending about said hub member, casings therefor, means to allow the cushion to be inflated through the said spindle, said casings having bores to allow sufficient movement therefor to relieve the jar upon a vehicle, said interior casing having inwardly projecting portions to engage said cushion to hold the cushion and interior casing against a lateral or rotary movement.

899,891. Axle for Motor Road Vehicles. Jules Niclausse and Albert Niclausse, Paris, France. Filed April 18, 1906. Serial No. 312,483.

1. In a motor vehicle, the combination, with an axle comprising a tubular body with an enlarged middle portion having oppositely disposed lateral openings, power transmission gear mounted on a suitable support, the gear support arranged to be passed together with the transmission gear through one of the openings and secured on the inner opposite side of the tube to close the other opening, and a cap arranged to close the first opening, of a drive shaft extending longitudinally with the axle with one end connected with the transmission gear and the other with the drive wheel of the vehicle.

899,913. Power Transmission Universal Joint. Hugh R. Shaw, Rosseau, Ontario, Canada. Filed Dec. 13, 1907. Serial No. 406,294.

1. A power transmission joint or coupling comprising a ball member, a segment of a ring secured on the ball member and extending over more than one-half of the circumference of the same, and a socket member having the interior thereof in excess of a hemisphere and provided with an arc-shaped groove located on a plane through the axis of rotation and extending from edge toedge of said socket member so as to form a continuous bearing surface for the segment on the ball from end to end as it adjusts itself in the groove during rotation as specified.

899,934. Wheel. George Wolke, Jacksonville, Ill. Filed Feb. 17, 1908. Serial No. 416,401.

A vehicle wheel comprising a hub and a felly, a plurality of flat springs spokes carried by the hub, a plurality of pairs of clamping plates secured to the felly and projecting inwardly therefrom, opposing flanges on the clamping plates adapted to form a channl way, and flat springs secured in the channel ways formed by the clamping plates and having pivotal connection with the flat spring spokes adjacent the next preceding clamping plate.

899,953. Clutch Mechanism for Automobiles and the Like. Lee S. Chadwick, Philadelphia Pa., assignor to Chadwick Engineering Works, Philadelphia, Pa. Filed April 21, 1908. Serial No. 428,352.

1. A clutch comprising a main clutch member, a split clutch band, means for operating said band, and means independent of the operating means for connecting the end of the band to the main clutch member and for adjusting it circumferentially thereon, said band being removable and replaceable in respect to the main clutch member and the adjusting means, which latter maintains its adjusted position in readiness to receive the band, when replaced, under the same adjustment as before its removal.

899,974. Variable Speed and Reversing Mechanism. Noah S. Harter, Waukegan, Ill. Filed Dec. 2, 1907. Serial No. 404,689.

1. In a variable speed and reversing mechanism, the combination of a driving member, a driven member concentric therewith, and provided with a geared portion, planetary gearing carried by said driving member and engaging said geared portion of said driven member, shafts mounted adjacent and at right angles to said driving member, friction discs mounted upon said shafts, gearing connecting said driving member between said shafts and said driven member, and provided with a geared portion engaging with said planetary gearing of said driving member, and a friction wheel splined upon said sleeve in engagement with said friction discs, substantially as described.

900,063. Carriage Top. Joseph P. Fillingham, Lansing, Mich., assignor to Reo Motor Car Company, Lansing, Mich., a Corporation of Michigan. Filed March 25, 1908. Serial No. 423,081.

In the horizontal bow of a carriage top, the combination of a bow member and a pair of base members, couplings uniting the said members provided with a pair of pins around either of which the two members may swing, the said pins being adapted to hold the members in rigid arrangement when both are inserted, but to permit the swinging of one member with respect to the other when either of said pins is removed, substantially as described.

900,098. Carburetter. Frank H. Heotger, Indianapolis, Ind. Filed April 14, 1905. Serial No. 255,586.

1. In a device of the class described, a mixing chamber having an air inlet at its bottom and a mixture outlet at its top, in combination with a valve in said chamber and seated about the inlet opening therein, for automatically controlling the admission of air at said inlet, a spring resisting the movement of the valve, means for adjusting said spring, a vapor tube formed on said valve, a nozzle of less diameter than said tube and rising therein to a point above said valve, anda suitable reservoir wherewith said nozzle is connected, substantially as described.

900,163. Fender Clip. William C. Groehn, Detroit, Mich., assignor to Briscoe Manufacturing Company, Detroit, Mich., a Corporation of Michigan. Filed Nov. 25, 1907. Serial No. 403,690.

1. A clip comprising a shank, a bifurcated member having open recesses formed in the furcations thereof forming seats for said shank, a bolt engaging said shank between said furcations, a clamping nut for engaging the shank of said bolt and a bearing for said nut on said bifurcated member opposed to the bearings for the shank in said furcations.

900,234. Vehicle Spring Structure and Frame. Harry T. Tillotson, Chicago, Ill. Filed Dec. 21, 1906. Serial No. 348,922.

1. A supporting structure, a member fulcrumed intermediate of its ends on said structure, and springs mounted on said structure at each end of said member and normally urging both ends thereof downward to maintain said member in equilibrium.

INTER-STATE STANDARD TOURING CAR, $1750.

The Inter-State

THE fact that the INTER-STATE automobile—a permanent, enduring car—is sold at a price but little higher than the price of temporary cars is all the more noteworthy when you realize that absolutely high grade quality is shown in every detail of its construction.

Nothing is slighted, no vital part is cheapened in the INTER-STATE. Consider its ignition system, for example. Every INTER-STATE car is equipped with Eisemann Magneto. The whole automobile world knows the high worth of the Eisemann Magneto. There is no more reliable ignition system. This reliability has been established not merely by its successful performances in many notable road races, but by the experience of thousands of owners of pleasure cars.

In all other mechanical details, in style, comfort, speed, control and finish, the light-running, graceful INTER-STATE—$1750.00 complete—finds its only competition in the **high-priced** high grade cars.

We want you to see the INTER-STATE. We want you to drive it, and give it every test before you **think** of spending your money for a cheaper car—or even a higher-priced car. We will be content to accept your judgment as to the worth of the INTER-STATE.

AT THE SHOWS—The full line of INTER-STATE Automobiles, including Standard Touring Car, Demi-Tonneau, Double Rumble Roadster, Single Rumble Roadster and Tourabout, will be exhibited at Grand Central Palace, New York, December 31-January 7, and at the Coliseum, Chicago, February 6-13.

INTER-STATE AUTOMOBILE CO. 126 Willard St. Muncie, Ind.

DEALERS AND AGENTS will quickly appreciate the opportunities opened to them by the INTERSTATE. Our proposition is unusually attractive.

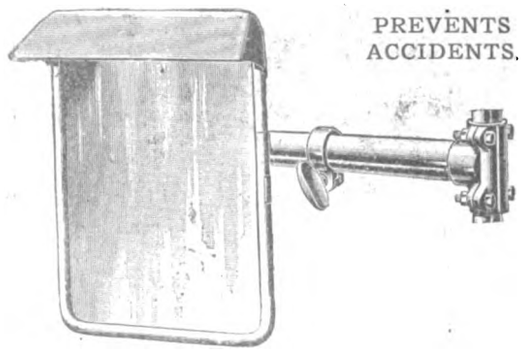
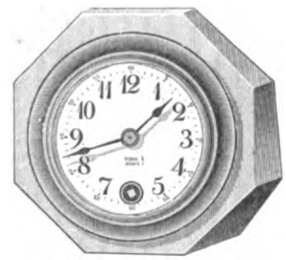
A Few of Our Imported and Domestic Specialties



THE YORK CLOCK

The very latest design. High-grade in every respect. Has no projections or obstructions that can be broken off. Will run eight days. Has heavy polished brass case. Dial measures 2¼"
Price $7.50



THE ARGUS MIRROR

See What's Coming!

If you could do this, half the accidents would be avoided. With the Argus Imported Dash Mirror (protected by a hood from the sun's rays or rain) you have a clear view of the road behind without turning the head. Adjustable to any position.
Price, less shield..... $7.50
Price, with shield $9.00

THE SAVOY CLOCK

Specially designed to resist all jars and shocks. Has elegant quick-train movement. Dial is a French Porcelain, measuring 2¾". Dust, rain and thief proof. Will run eight days.
Price $10.00

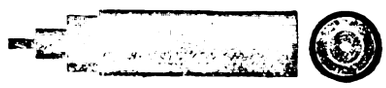
FOOT RESTS

Absolute necessities in every tonneau. They enable the occupants to brace themselves in a comfortable position and prevent the accidental scratching and damaging of the body of the car.
Price, 32 in. long $2.50

ROBE RAILS

Keeps robes and wraps from being crushed or soiled in bottom of car. Made of heavy brass tubing, highly polished.
Stationary, 24 in. ..... $ .85
Adjustable folding rail 2.50

SPARK PLUGS

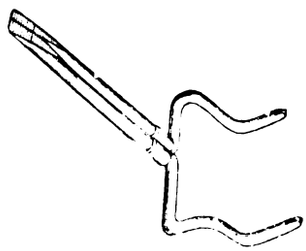


We carry a large stock of every imported and domestic plug on the market.

Renault Spark Plug	$2.50
A. V. Magneto Spark Plug	2.00
Bosch Spark Plug	2.00
Motorcycle Spark Plug	.75

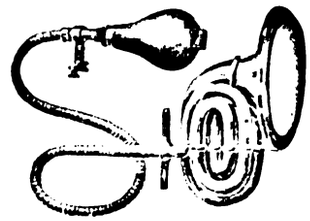
and many others.

PIRELLI CABLE



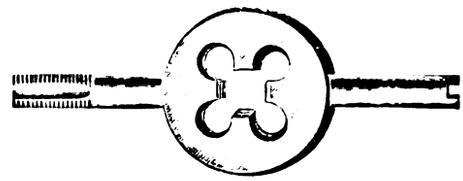
That wonderful Italian cable that is used by every well-known auto manufacturer in this and other countries. Ask us to send you our sample card showing the different sizes and prices, made with rubber and cambric covers.

STEERING PILLAR LAMP



This lamp enables a driver to direct a powerful beam of light to any part of a dash board, enabling him to watch any of the indicators on the dash.
Price $6.00

FORK TIRE LEVER



A new style fork lever tire tool for removing and replacing security lugs and tubes in tires. Equipped with rollers, which prevent damaging tire while removing.
Price ..... 50 cents

BLANCHARD HORNS

THEY HAVE THE SOUND that made imported horns famous. There are over twenty-one different styles in up-to-date designs. Let us send you our Blanchard Horn catalogue.

ROYAL VALVE TAP AND DIE

A handy little tool for unscrewing valve insides and cutting new threads on the outside or inside of valve. Should be in every tool kit.
Price ..... 25 cents

The dealer who desires to handle the BEST line of Automobile Specialties, would do well to investigate our line of splendid and profitable goods. Our special Show Catalogue will be sent on request.

For First Class Travel select a

Pullman Car

Safety and Comfort demand it. Car-wise users choose it

¶ The record of Pullman automobiles is a record of unbroken and uninterrupted successes in the hardest hill climbing, cross country, economy and track events everywhere.

PULLMAN MODEL K, 4-CYLINDER, 30 H. P.

Our 1909 Models are:

Model I., 20 H. P. Runabout, Price	$1,500
Model L, 20 H. P. Toy Tonneau. Price	1,600
Model K, 30 H. P. 5-Passenger Light Touring Car Price	2,000
Model K, 30 H. P. Toy Tonneau or Roadster. Price	2,000
Model 6, 30 H. P. High Speed Runabout. Price	2,500
Model 4, 40 H. P. Gentleman's Roadster. Price	3,000
Model M, 40 H. P. Seven Passenger Touring Car. Price	3,500

¶ Pullman cars are correct in design and construction, embody the most advanced mechanical practice and in general appearance and finish are not surpassed by any cars at any price.

¶ To the agent who expects to remain in the business permanently, and who has an eye to the future, the line of Pullman automobiles should powerfully appeal. We ourselves are building for the future by building in the present the best automobiles we know how, and dealing in them in fair and square methods.

THE MARMON

"A Mechanical Masterpiece"

This Car Represents Economy—Not Cheapness!

Over and above the fact that this is a car that will live, that you can depend upon and be proud to own—

It is a car offering a positive, proved value which you can get right down to brass tacks and figure out.

Figure up its equipment, note that its design includes all the best things in motordom, take into consideration Marmon workmanship, materials and construction methods, and then compare it with anything on wheels at $3,000 or less. Send for the detailed specifications.

Genuine Krupp and Chrome Nickel Steels used for important parts. Bosch magneto and battery—dual system. Hess-Bright ball bearings. Transmission and rear axle in one unit. Large brakes. Marmon oiling system. Weight, 2,100 lbs. 32-40 H. P. Tires, 34x4, all around. Complete equipment. Touring Car, Roadster, Four-Passenger Suburban, Coupe, or Limousine Town Car.

The superb Marmon "Fifty" (Seven-Passenger Body), $3,750.

Mayo Radiators are as Unobtrusive as Good Form

¶ They don't "spout" or "slop over," and are thoroughly effective.

¶ Mayo Radiators are their own reason for their general use on really high-grade cars.

¶ Mayo Radiators are built first and built as well as the finest kind of artisans working with the best materials and under the most favorable conditions can build, and their cost is based on their worth.

¶ Mayo Radiators assure that whatever troubles a car may have, they are not due to the radiator.

¶ Mayo Radiators are not within the price limit of cheap cars. Equally true it is that they are within the quality limit of all good cars selling at any price.

¶ A Mayo Radiator axiom:

If the rest of the car is as good as the Mayo Radiator, it's all right.

¶ Mayo Radiators are made in a Quality Shop at New Haven, Connecticut.

A Year of Triumph for BOSCH Magneto

On the Track

Bosch won the French Grand Prix. The Prince Henry Contest. The Grand Prize at Savannah. The Light Car Event at Savannah. Both Brighton Twenty-four-Hour Races. Nazzaro established the world's record (120 miles an hour) with a Bosch. Many minor track events were also won with this system.

On the Road

The Thomas car won the New York-Paris Race with a Bosch. The winning cars in the A. A. A. Touring Contest were equipped with a Bosch. T. K. Hastings completed the Six Day Reliability Trial (Auto Cycle Union of England) with a Bosch.

In the Air

Zeppelin's great Dirigible Airship used two Daimler Motor Engines equipped with a Bosch.

On the Water

Dixie II, winner of the International Trophy in the greatest Motor Boat Race of the year was equipped with a Bosch.

On the Market

The Bosch is recognized as the best Ignition System obtainable and it is found on the majority of cars all over the world. Order a Bosch NOW for your car!

MADE ON SCIENTIFIC PRINCIPLES

HIGHEST EFFICIENCY

KNOX AUTOMOBILE COMPANY,
53 Wilbraham Road.

Springfield, Mass, Dec. 23, 1908.

BUSH MFG. COMPANY,
Hartford, Conn.

Gentlemen: In regard to the action of your radiators on our Vanderbilt Cup racers, would say we used your standard 3" section radiator on both our model O and model M cars, both radiators having exactly the same frontal area.

Both cars were run over the road to the race from Springfield and the drivers state that no water was added to either radiator during the practice or in the race, and that the cars were run back to Springfield with the same water in them as when they started. This seems to us to be a remarkable showing, particularly as the large car ran almost the entire race on a retarded timer setting, the magneto having gone wrong in the first lap. Yours very truly,

KNOX AUTOMOBILE COMPANY,
H. G. Farr, Supt.

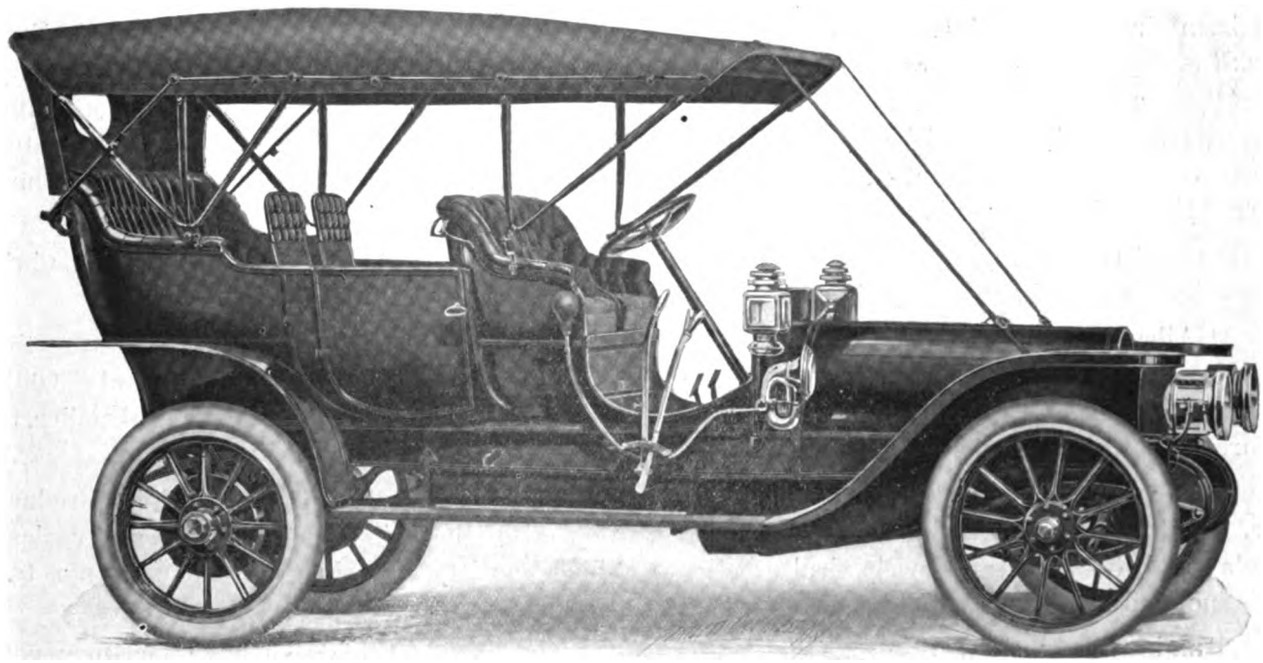
Any good automobile will give you pleasure. But which one will give you the most pleasure and the most service for what it costs?

Look at the facts.

The Franklin air-cooled engine gets more power out of the gasoline than a water-cooled engine, because it runs at a more efficient temperature. This means fuel economy right at the start.

The Franklin engine is lighter. There is no water-cooling apparatus. The whole automobile is lighter, as well as simpler and stronger. This means further fuel economy, and an enormous saving of tires. The weight of an automobile is what wears out tires and makes big bills.

The Franklin six-cylinder seven-passenger Model H, the most capable touring-car for American roads, is the only light-weight large automobile. It doesn't begin to use up tires as fast as the heavy water-cooled machines. And it is more comfortable. Many people who can endure only a limited amount of riding in a steel-frame half-elliptic spring automobile, find that in a Franklin with its full-elliptic springs and its laminated wood frame they can ride all day—and day after day, with comfort and enjoyment.



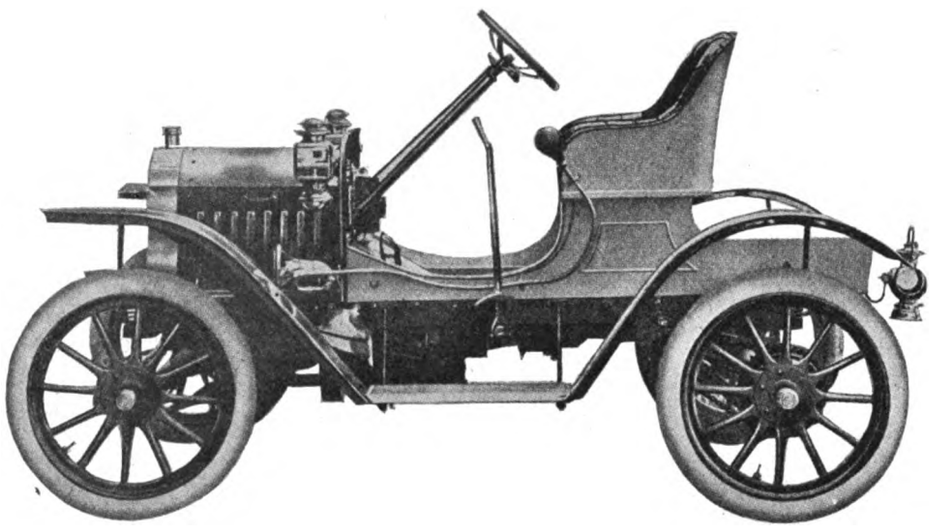
So the Franklin gives more mileage—more service, on all sorts of roads. And more service in the year. You can use any Franklin all the time—winter and summer. There is nothing to freeze nor overheat.

What real comfort is there in a heavy hard-riding automobile? How much satisfaction in one that you cannot use readily and freely every day in the year?

Franklin automobiles, measured by quality, and by what they do, are the best automobile value there is.

Learn the facts before you buy.

Write for the new 40-page Franklin catalogue de lux , describing the complete line of Franklin runabouts, touring cars and closed cars. The most informing automobile ca alogue ever issued. Sent only on request.



Franklin seven-passenger Model H, 42 H.P., six-cylinder, air-cooled motor, selective transmission, 127-inch wheel base, 36-inch wheels, Bosch high tension magneto. Finish, royal blue, $3750. Top extra. Single or double rumble seat runabout. Finish, red and black, $3600. Limousine, finish, royal blue, $5000. Prices f. o. b. Syracuse.

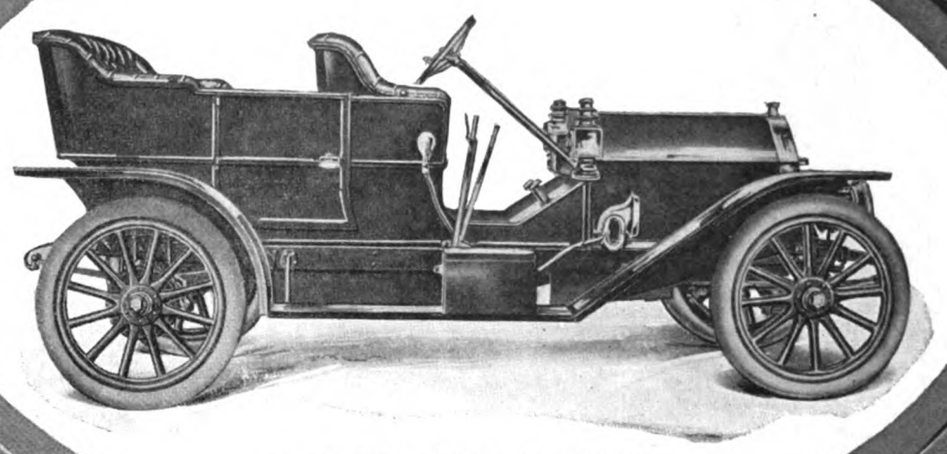
The One Big Feature of the New York Show

has been the trans-continental Brush Runabout, placed on exhibition exactly as it came to New York the day before the show opened. The thousands upon thousands of visitors carried away with them a blurred, vague, nameless impression of cylinders, polished steel, valves, sputtering sparks, handsomely finished bodies, lights, noise, tires, dust and salesmen, but for every visitor one feature at least stood out prominently—the little seven horsepower Brush Runabout which had crossed the American Continent and climbed Pike's Peak.

It stood there dirty, muddy and scarred but not in the least rickety or worn out, and it hadn't been rebuilt a few times or any times at all, on the way.



At Albany, it was scheduled to climb the Capitol steps and permission was obtained from the officials, but at the last moment Governor Hughes disappointed the crowd (estimated at 5,000), which had assembled to see it by forbidding the attempt and sending a squad of special police to enforce his orders and disperse the assemblage.

The Brush has won out. It has marked the beginning of the latest tendency, which is to reduce size, weight and complications. It has sounded the knell of the vulgarity of bigness and useless display and the keynote of mechanical excellence, which consists in doing just enough—not too little, not too much—and doing that as well as it can be done.

Examine the workmanship and the materials. Ask users. Considerable open territory yet. The right man wanted in enough more places to take up our total possible product.

BRUSH RUNABOUT CO., Detroit, Mich.

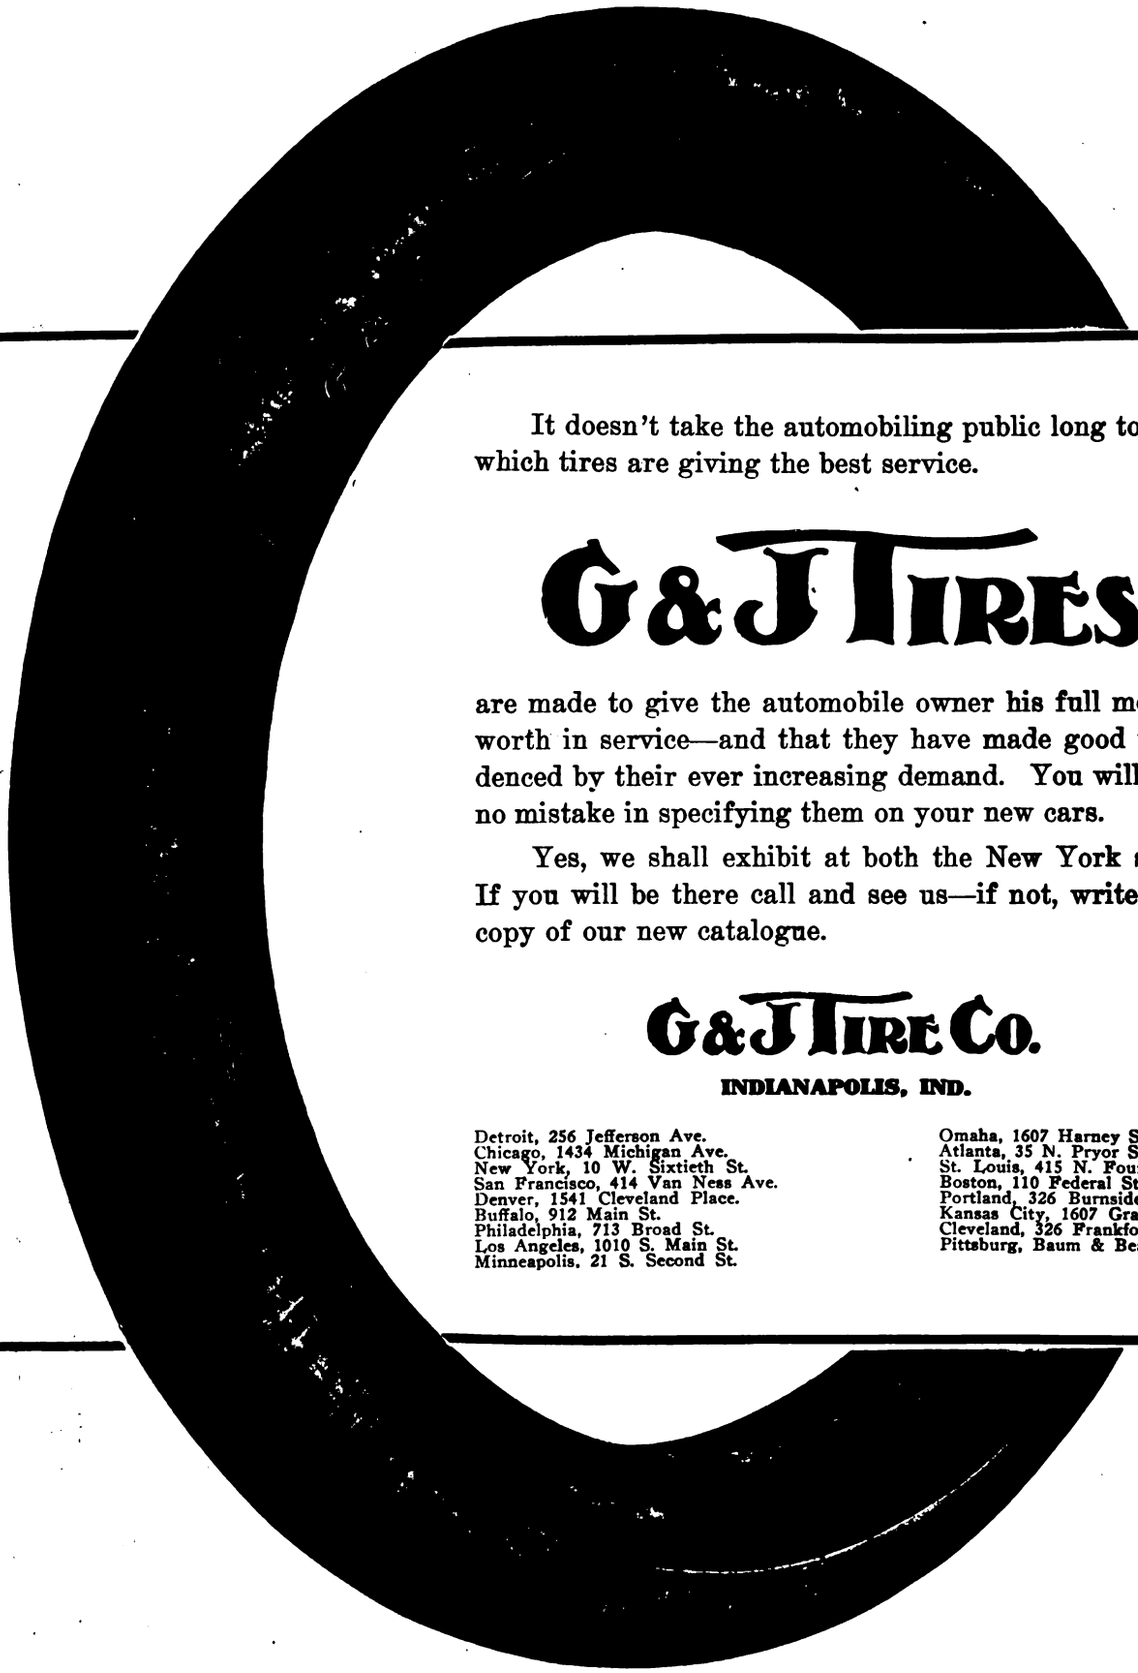
INTER-STATE STANDARD TOURING CAR, $1750.

The Inter-State

THE fact that the INTER-STATE automobile—a permanent, enduring car—is sold at a price but little higher than the price of temporary cars is all the more noteworthy when you realize that absolutely high grade quality is shown in every detail of its construction.

Nothing is slighted, no vital part is cheapened in the INTER-STATE. Consider its ignition system, for example. Every INTER-STATE car is equipped with Eisemann Magneto. The whole automobile world knows the high worth of the Eisemann Magneto. There is no more reliable ignition system. This reliability has been established not merely by its successful performances in many notable road races, but by the experience of thousands of owners of pleasure cars.

In all other mechanical details, in style, comfort, speed, control and finish, the light-running, graceful INTER-STATE—$1750.00 complete—finds its only competition in the **high-priced** high grade cars.



We want you to see the INTER-STATE. We want you to drive it, and give it every test before you **think** of spending your money for a cheaper car—or even a higher-priced car. We will be content to accept your judgment as to the worth of the INTER-STATE.

AT THE SHOWS—The full line of INTER-STATE Automobiles, including Standard Touring Car, Demi-Tonneau, Double Rumble Roadster, Single Rumble Roadster and Tourabout, will be exhibited at Grand Central Palace, New York, December 31-January 7, and at the Coliseum, Chicago, February 6-13.

INTER-STATE AUTOMOBILE CO. 126 Willard St. Muncie, Ind.

DEALERS AND AGENTS will quickly appreciate the opportunities opened to them by the INTERSTATE. Our proposition is unusually attractive.

THE SELDEN CAR

MADE BY

"The Father of Them All"

One Price, $2,000. F. O. B. Rochester.

TOURING CAR, ROADSTER, TOY TONNEAU

A genuinely good car cannot be made and sold for less than $2,000. By this we mean a car like the Selden, containing nothing but the best of materials, workmanship and finish. A car that the manufacturer can stand behind and guarantee for at least a year against any imperfections in workmanship or material.

We buy only the best materials, employ only skilled labor and pay particular attention to details and finish, thereby producing a strictly high-grade car at the lowest possible price.

The up-keep and maintenance of a medium-priced car like the Selden is within the reach of any man of moderate means and the value of the car does not depreciate like that of the lower priced cars. This is the point to be considered by every purchaser.

The Selden Car is a 4-cylinder 28-30 horsepower (developing 37 horsepower) five passenger Touring Car or three passenger Roadster, with 114-inch wheel base, 34-inch wheels, shaft drive, selective control, pressed steel frame, metal body, fully equipped.

Superb riding, roomy tonneau, luxurious upholstery, smooth running, great hill-climber, flexible and easily handled, economical in maintenance and up-keep, fine finish, stylish and attractive.

THE COMING CAR OF MODERATE PRICE

Catalog and Agency proposition upon request. Agencies wanted everywhere.

We will exhibit at Madison Square Garden Show.

THE MARMON

"A Mechanical Masterpiece"

Marmon "Thirty-two", $2400

An Automobile Classic—A Conspicuous Value

The Marmon "Thirty-two" is neither a cheaply-built car at a low price, nor a "good enough" car at a high price.

It is a high grade car in every sense of the word, built as carefully as a fine watch. The parts are interchangeable, all of them manufactured by us, rigidly tested and carefully assembled into a harmonious whole.

Weighing not over 2,100 pounds, with 32-40 H. P., this "Thirty-two" has a world of speed and ability. In performance, as in appearance, it is a car that needs no apologies—occasions no regrets—a car you will be proud to own.

The "Thirty-two" sustains the Marmon reputation for mechanical excellence. It can be depended upon to stand up under the most severe usage, year after year.

To the man who looks ahead and buys with his eyes wide open, this car is an emphatic bargain. No other car on the market at $3,000 or less offers so much actual value.

Get the specifications, notice the character of design and equipment, and make a few careful comparisons.

Genuine Krupp and Chrome Nickel Steels are used for important parts. Bosch magneto and battery—dual system. Three point motor support. Straight line shaft drive. Rear axle and transmission in one unit. Marmon oiling system. Large brakes. Hess-Bright imported ball bearings. Big tires (34x4 all around). Complete equipment. Furnished as Touring Car, Roadster, Suburban, Coupe, or Limousine Town Car.

The Marmon "Fifty," $3750

A superb car, of most distinguished appearance. In hard, practical cash value, it is the superior of the most famous foreign cars selling at two or three times the price. Furnished with seven-passenger body. 50-60 H. P. Completely equipped.

Marmon "Forty-five" Roadster, a special model, $3,500

What Good Tires Mean To You

Throughout the world Morgan & Wright tires are known as good tires—because they are.

To the motorist this statement of demonstrated quality means much, for—

It is a guarantee against wholly unnecessary repair bills—against all repair bills, in fact, except those necessitated by accident or natural wear;

It stands for protection to the car, which can be secured only by the use of tires that are built to withstand emergency tests as well as ordinary service;

It's an assurance that you will be spared the exasperating inconvenience which always attends breakdowns of any kind—especially those against which you could be protected.

MORGAN & WRIGHT TIRES

have literally won over hundreds of motorists by reason of their protective quality—the quality that makes them absolutely safe under any condition.

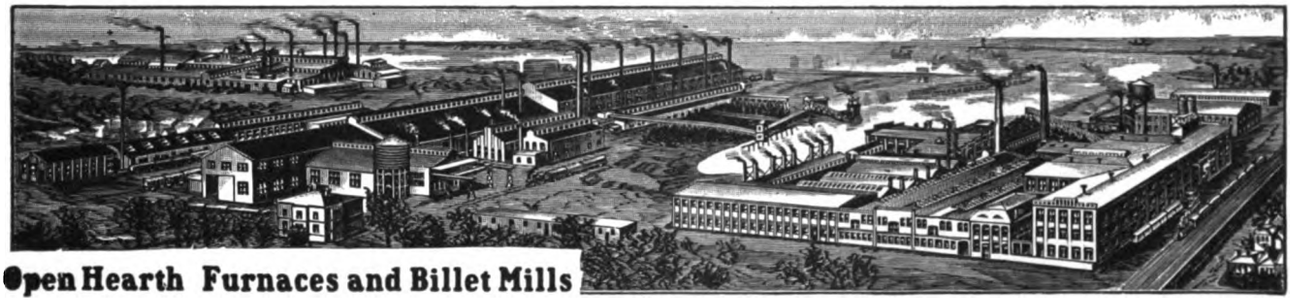
Whether this protection is secured through the grade of materials used, or through our method of tire-building, or as a result of extremely rigid inspection which every tire undergoes before it is permitted to leave the factory, is comparatively unimportant to the user.

The vital consideration—and the only one that appeals to the experienced motorist—is this:

These tires actually stand up day in and day out under every condition of both load and road, as only tires can that are made as MORGAN & WRIGHT tires are.

And it is because users of these tires have repeatedly found this to be true, that we invite all motorists to give them an impartial, comparative test.

There is no method of making friends
equal to the method of making good.



MORGAN & WRIGHT, DETROIT

Mayo Radiators are as Unobtrusive as Good Form

¶ They don't "spout" or "slop over," and are thoroughly effective.

¶ Mayo Radiators are their own reason for their general use on really high-grade cars.

¶ Mayo Radiators are built first and built as well as the finest kind of artisans working with the best materials and under the most favorable conditions can build, and their cost is based on their worth.

¶ Mayo Radiators assure that whatever troubles a car may have, they are not due to the radiator.

¶ Mayo Radiators are not within the price limit of cheap cars. Equally true it is that they are within the quality limit of all good cars selling at any price.

¶ A Mayo Radiator axiom:
If the rest of the car is as good as the Mayo Radiator, it's all right.

¶ Mayo Radiators are made in a Quality Shop at New Haven, Connecticut.

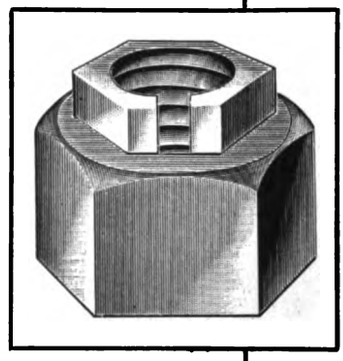
"Locking the door after the pony is stolen"



is a good deal like postponing the use of

Columbia Lock Nuts

Now

for it's only a postponement at best. Why not take a double-twist on the forelock of old Father Time and incorporate the use of Columbia Lock Nuts in your construction BEFORE you have occasion for regrets? Columbia Lock Nuts are in general use and are regarded as a necessity by some of the biggest railroad systems in the country. They ought to be a double necessity on automobiles. They are already used by many prominent makers. They should be used on every automobile everywhere.

¶Columbia Lock Nuts simply cannot work loose. Vibration, even the constant vibration of solid tires, cannot affect or loosen them. They are automobile insurance of the very best kind and their cost is not a factor. Let us prove our case.

The Magneto That Starts Itself

THE PRACTICAL SOLUTION OF THE MAGNETO PROBLEM

It does not take an exceptional magneto to give fairly good service on a small car. A large car, however, is a problem of a different order.

When the cylinder bore exceeds four inches diameter, quick turning of the starting crank to generate a spark from the magneto requires both strength and skill. The owner of such a car is reminded that he has a magneto every time he stops the engine, and frequently he will burn gasoline to keep the engine going, sooner than stop and restart.

A magneto handicapped in this manner cannot be called a perfect instrument.

The largest engines used in automobiles are started as easily as the small if they are fitted with the UNTERBERG & HELMLE SELF-STARTING MAGNETO, TYPE L. E. No other magneto does all that a magneto should do. No other is free from the necessity of adding a battery and complicated wiring to render it manageable on large engines at low speed.

See the $1,500 Car at the Chicago Show

THE CAR—With 4 inch tires instead of 3½ inch.

THE CAR—With the high grade magneto free.

THE CAR—With $300 worth of actual automobile value in it that with any other $1,500 car would cost you extra.

Don't pay $1800 for a $1500 car, nor $1500 for a $1200 car.

See the $1500 car that has all of $1500 value in it.

See if this car doesn't meet your ideal before you decide on some car that falls short of it.

We have built and sold in the last 8 years $11,000,000 worth of low priced Mithcll cars with five bearing crank shafts and not one that we know of has broken.

It remains for you to decide which you want.

What Larger Tires Mean

Then there's the question of tires, and if you're a motorist you know what that question means.

The Mitchell "30" $1500 car is equipped with 4 inch tires.

Yet cars that weigh more have 3½ inch tires.

If you want 4 inch tires with other $1500 cars you must pay extra for them—$50 extra.

The reason makers work toward light weight is to save your tire expense.

But we doubly protect you with light weight and with tires that are ½ inch larger than the tires others think large enough.

No Other Car of Such Value

In the Mitchell "30" at $1500 is included $300 worth of actual automobile value that with any other $1500 car would cost you extra.

Other cars that lack this value should be sold for $1200.

In fact to get equal value elsewhere will cost you at least $1800.

And please remember that we're not beginners in the making of $1500 cars—that we're not experimenting at your expense when we sell you a car at this price.

We are the pioneer low priced car builders of the country. And the public in the past 8 years has valued the Mitchell car at $11,000,000 by paying that much for our product.

No car but a car that has stood the tests would have such an approval put on it.

And do you know of a fairer judge than a disinterested public?

Isn't the car that has pleased so many the most likely to please you?

Note These Specifications

See If They're Not What You Want In Your Car

It has a wheel base of 104 inches. The body is wholly of metal. Its four cylinders are case separately. 28-30 horsepower.

The engine is housed under a big, handsome hood.

The springs are of vanadium steel.

Aluminum castings are employed wherever possible; only we go to the trouble and expense of strengthening them with bronze where thter is wear and strain.

The wheels are big—thirty-tdo inches—fitted with detachable rims and four-inch tires.

There are two complete ignition systems—Magneto and a regular battery system.

The lubricating system is the best that we have found in eight years of experience.

The transmission is of the best selective sliding gear type—as in $5000 to $7000 cars.

The battery and tool boxes, made of baked enameled steel. are furnished without extra expense to you.

The tonneau is detachable—and you have your choice of either tonneau, surrey body, rumble seat roadster, or runabout deck at $1500.

See this car at the Chicago Show February 6th to 13th where you'll have achance to compare it with all other cars selling at prices around $1500.

Let the result decide which car is best for you.

Send the coupon for detailed description, to enable you to check this car up with others at its price.

New Series TIMKEN Short Bearings

In offering the Automobile trade our **New Series Timken Short Bearings,** we do so with the assurance that they are made from the same carefully selected steel and subjected to the same severe tests as our standard size Bearings.

The **New Series Short Bearings** are designed for use in axles where the bearings space does not permit the use of our regular series.

These Short Bearings can be used on any axle, transmission, or other places where Annular Bearings can be used. They carry **a much greater load** than Annular Bearings of the same length, **are smaller in diameter** and in addition will take as much **end thrust** as they do **radial load.**

Every bar of steel entering into **Timken** Products is made to the **Timken** analysis chemically—and tested to the **Timken** test physically—which means a rejection of **45 per cent.** of every ingot before metal of suitable density and soundness for **Timken** Roller Bearings can be obtained. These new Short Bearing Rollers are made from best nickel steel.

This is one reason why **65 per cent.** of the makers of high-grade Automobiles and over **90 per cent.** of the commercial truck builders of this country use **Timken** Roller Bearings. **WRITE FOR CATALOG AND PRICES**

PALMER-SINGER

ALL CARS SOLD BY US ARE LICENSED UNDER SELDEN PATENT AND GUARANTEED FOR ONE YEAR.

The Palmer-Singer Town and Country Car, 1909 Model, Type XXX-2, is now being exhibited and delivered. It is the most serviceable car on the market today. Its 28-30 H. P. motor provides ample power to take its full complement of passengers on long, hard tours over any road at a very good speed. Closed, it is a beautiful, luxurious Town Car, seating four inside, ideal for the purpose and far superior to many foreign makes at double the price. A glance at the specifications will show the remarkable value it offers.

Nickel steel is used to give lightness and strength. Imported F. and S. ball bearings exclusively. Bosch high tension magneto and multiple disc clutches. Drop forged I beam, front axle— four-speed selective type, sliding gear transmission with direct drive on third speed. All brakes equalized, all expanding type and on rear wheels. Universal joints on all steering connections. Shaft driven, all moving parts enclosed in dustproof cases.

Don't Guess Which Tire Is Best— Here Is Proof

In New York City there are 1,000 Taxicabs.

On the tires, more than on any other one thing, depends the profit of the Taxicab business.

You may be sure that the owners of the 1,000 Taxicabs did not GUESS.

They TRIED all the tires that were offered, and checked them up with the TAXIMETER—which told them the mileage unerringly, indisputably.

There was no personal preference. No friendship. No prejudice. It was a cold-blooded BUSINESS test.

And the result: 800 out of the 1,000 Taxicabs in New York, operated by several competing owners, have contracted for Goodyear Tires to be used EXCLUSIVELY.

GOODYEAR

To understand why the Goodyear Tire stood head and shoulders above its competitors in this Taxicab test, you must understand, first, the difference between a *moulded* tire and a *wrapped tread* tire.

The moulded tire is built up, layer by layer, on an iron core. Over it is clamped an iron mould. When the heat of the curing process is applied, that rubber expands—and in expanding, forces a perfect union between the various layers of rubber and of fabric.

With the moulded tire, so far so good.

But in building up that tire on its iron core, a skilled workman lays fabric on fabric, rubber on rubber.

Yet, skilled as he may be, he cannot wholly avoid wrinkles, irregularities, unevenness, which, under the pressure of curing, multiply themselves into *hidden* weaknesses and defects.

Some tires, instead of being cured on an iron core, are cured on an *air bag*, which is really an extra strong inner tube.

When the air bag has been inserted in the built-up tire, strong tape is wound around it, and then it is cured in live steam.

The advantage of the wrapped tread process is that the air bag, full of compressed air, smoothes out these wrinkles and irregularities and prevents those hidden weaknesses and defects.

The advantage of the wrapped tread process is, for this reason, immeasurable.

But the tire made by this process does not get the *terrific squeeze* that the moulded tire gets when the heat expands it between core and mould—the squeeze that forces the rubber into the fabric, making a perfect union between fabric and rubber.

In losing that squeeze, it loses durability, strength, unity—which more than offsets the fact that the wrapped tread tire can have no hidden wrinkles or unevenness.

Obviously, the tire you ought to have is the one which is built up on an iron core, *squeezed* the same as a moulded tire—and *finished* on an air bag to smooth out the irregularities.

There is just one tire made in this way—*only one*. It is the Goodyear Quick Detachable.

This one point of superiority is reason enough why the Goodyear Quick Detachable should have won the Taxicab test.

But there are other reasons—other superiorities.

The Goodyear Quick Detachable is, for example, an *oversize* tire.

The Goodyear tire is made larger than the specifications call for. It is simply 15% larger than any other tire marked the same size.

Among the countless other Goodyear superiorities is the patent rubber-rivet breaker-strip, which makes it impossible for the tread to split or peel from the carcass of the tire.

Goodyear superiorities extend from the raw materials to the workmanship—from scores of exclusive Goodyear processes to the Goodyear piano-wire tape which would hold the tire on the rim, even if both the detachable flanges were off.

When you think of tires, think of that Taxicab test.

Those 800 Taxicabs in New York are doing 60,000,000 tire miles a year!

More than 1,000,000 tire miles a week!

And what is true of the Taxicabs of New York is equally true of practically every large Eastern city where Taxicabs are used.

Eight out of every ten of them are using Goodyear tires exclusively.

Think of that, you who have bought tires because you have heard of their use on some tour or some race!

Think of that, you who blindly groped at the tire problem—you who have bought tires wholly by hearsay!

Don't you see, now, that tire-buying has been reduced to a *business* basis?

Isn't the tire that the Taxicab took—isn't *that* the tire for you?

A hundred times more about tires than can be explained here, can be found in our book, "How to Select an Auto Tire."

Send for it now. It is free.

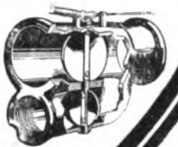
GABRIEL 1909

In order to maintain the high standard which the products of our factory have acquired, many improvements have been made in the 1909 models of The Gabriel Horn, The Gabriel Shock-Absorber and The Gabriel Cut-Out Valve. Gabriel Products still set the pace which competing lines try to follow.

A Polite Request

The rich mellow notes of THE GABRIEL HORN act as a polite request, not a harsh demand. It warns without frightening. By a new device its sweet, musical three note tone used for city purposes can be caused to rise in unison for a penetrating warning on country roads. The Gabriel Horn is used exclusively on the personal cars of King Edward of England, Emperor William of Germany, and other crowned heads of Europe.

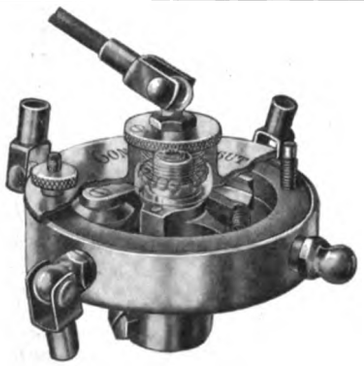


1909 Gabriel Horn and Cut-Out Valve

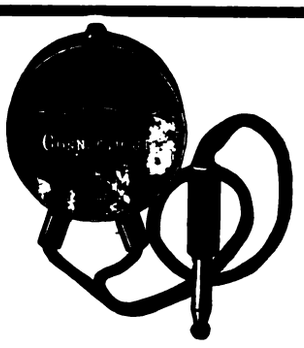
We have perfected a new valve which is used both for operating exhaust horn and for cut-out purposes. For cut-out purposes, remove the disc in main channel thereby relieving back pressure from muffler through additional opening of 1¼ inches. Made to fit exhaust pipes 1" to 2½" outside diameter. Warranted to not stick under any condition.

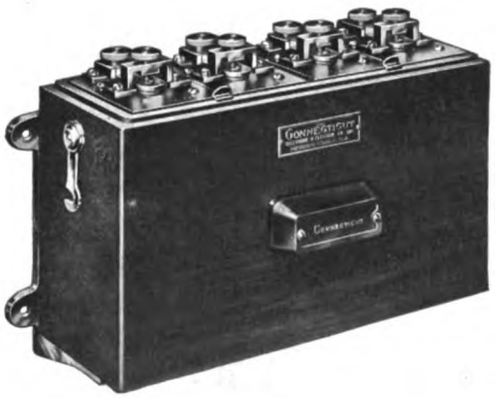
Going Up

is pleasant enough, but coming down with a thud is what makes the nerves quiver and cry for



1909 Gabriel Shock Absorbers





A retarding friction gradually applied in proportion to the shock takes up all jolts and jars, and makes riding over rough roads or bumpy pavements a positive pleasure. The 1909 Model has improvements which give increased bearing surface, eliminate noise or rattle and greatly increase its efficiency and durability. Thermoid used for friction pad. Can be attached to any car or any type of spring. Write for booklet illustrating and describing our 1909 products.

Rambler

Breaks Los Angeles-San Diego Record

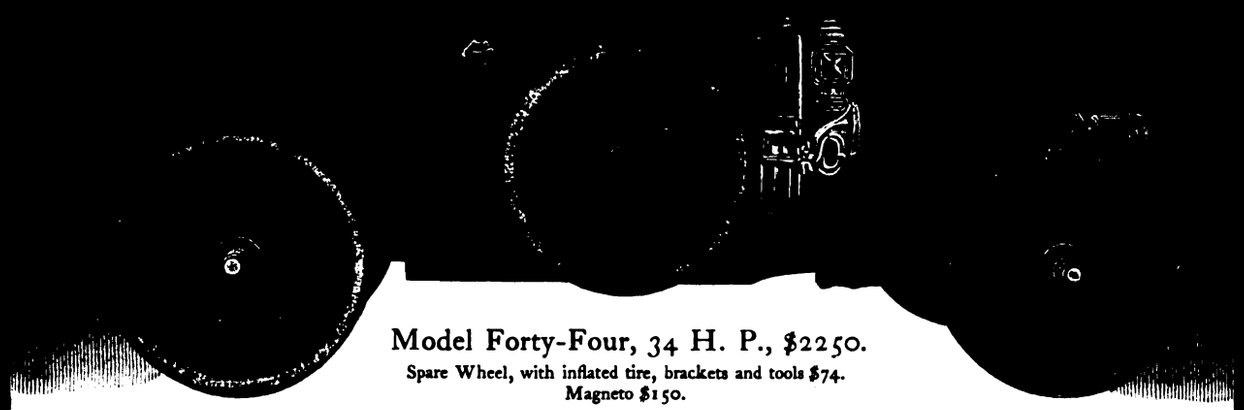
New 32-H. P. Four-Cylinder Rambler Roadster Beats By 45 Minutes Time Record Established By Six-Cylinder Car And Is Awarded The Chanslor-Lyons Challenge Cup.

THREE hundred and thirty miles in ten hours and thirty-two minutes and not a single stop for repairs. That is the new round trip record between Los Angeles and San Diego, California, just established by the new 32 horse power, four-cylinder Rambler roadster.

This is the second time the Rambler has made this sensational run and each time it has broken all preceding records.

The first time the Rambler made the run in 11 hours and 31 minutes. Shortly afterwards a six-cylinder car reduced this time by a bare 14 minutes. The Rambler went after the record again, this time reducing its own time by nearly one hour.

There are certain mechanical features of the Rambler which make it possible for it to excel in consistent road performance any other car at any price. If you care to know what these features are, send us your address and we will be glad to send you our new catalog.



THE CAR OF STEADY SERVICE

Model Forty-Four, 34 H. P., $2250.
Spare Wheel, with inflated tire, brackets and tools $74.
Magneto $150.

THE SAFETY SPARK RETARDER

There is absolutely no danger in cranking a Rambler when properly adjusted. The starting crank then cannot engage until the spark has been automatically retarded.

Every one who has had the unpleasant experience of a premature spark in starting an automobile will appreciate the Rambler safety starting device. This prevents an explosion ahead of center, even though the operator forgets to retard the spark.

You cannot engage the lug on the shaft with a tooth on the starting crank until the spark-retarder lever has moved from the position of the dotted line to the position shown, thus retarding the spark.

Rambler

The Car with the Offset Crank Shaft

Seven passenger model, forty-five horse power with offset crank shaft, $2500. Other models, $1150 to $2500. Write for catalog describing in detail Rambler offset crank shaft, Spare Wheel, straight line drive and other exclusive features of the new Rambler models.

THE MOTOR WORLD

Volume XIX. New York, U. S. A., Thursday, January 7, 1909. No. 15

COIL MAKERS PREPARE FOR FIGHT

Eleven of Them Refuse to Recognize Certain Patents and Form an Association —The Officers Chosen.

Sparks may be said to have commenced to fly in the coil trade. Things began to warm up when early last month it was made known that the Autocoil Co. and the Connecticut Telephone and Electric Co. had pooled their patents applying to coils having removable units and had formed the patent-holding Unit Coil Co. The most important patents involved are numbered 878,435 and 884,116, which all other manufacturers are alleged to be infringing.

The latter were given due notice of the claim and were warned that they must "step up to the captain's office," recognize the patents and make their peace. This they declined to do and as a result the Allied Coil Manufacturers Association was formed for protective purposes at a meeting held yesterday at the Prince George Hotel, New York, when the following officers were chosen: F. W. Brandow, president; C. T. Byrne, vice-president; J. O. Heinze, secretary-treasurer; executive committee, W. P. Woods, Dalton, Mass.; Charles F. Splitdorf, New York, and F. A. Woods, Lansing, Mich.

The members enrolled are as follows: C. F. Splitdorf, New York; Pittsfield Spark Coil Co., Dalton, Mass.; Heinze Electric Co., Lowell, Mass.; Brandow, Jacobson & Co., Pittsfield, Mass.; Kokomo Electric Co., Kokomo, Ind.; National Coil Co., Lansing, Mich.; New York Coil Co., New York, N. Y.; Duplex Coil Co., Fon du Lac, Wis.; C. Per Lee Noxon, Syracuse, N. Y.; Chicago Coil Co., Chicago; American Coil Co., Foxboro, Mass.

Immediately after organizing the association issued a statement declaring it to be the purpose of its members to "defend their legal rights to manufacture, use and sell interchangeable unit spark-coils," and that they "will in defense of same, defend any suit instigated against any member of this Association, or any of its customers, involving the basic principle of interchangeable unit coil construction."

The statement concludes with a request that their customers forward to the members of the association "all communications of a threatening nature received from any source."

Overland Obtains Two More Buildings.

That the Overland Automobile Co., Indianapolis, means to be in position to bid for business on a big scale and to meet any demand that may arise is quite clear. They have just purchased the former plant of the Marion Motor Car Co. and leased the building previously occupied by the Speed Changing Pulley Co., both of which are in Indianapolis and which will be operated in connection with the present Overland plant.

Hazlitt Joins the E. M. F. Staff.

James Hazlitt, formerly chief engineer of the Garford and Ranier companies, has engaged in a similar capacity with the Everitt-Metzger-Flanders Co. of Detroit. Will Kelly remains with the latter company as chief designer.

Fuller to Produce a Motor Buggy.

The Fuller Buggy Co., Jackson, Mich., one of the largest and oldest manufacturers in the buggy trade, have a motor buggy about ready for marketing. It employs a two cylinder, 10 horsepower engine.

Omaha Advances Its Show Dates.

The dates of Omaha's fourth annual show have been advanced from March 1st to 6th to February 24th to 28th, inclusive. It will be held under the auspices of the Omaha Automobile Show Association.

Reliable Dayton Opens Southern Branch.

Reliable Dayton Motor Car Co. of Chicago have opened a branch in Memphis, Tenn., who will be the distributing point for Tennessee and Arkansas. J. D. Kinney is in charge of it.

TARIFF TILTER FIRES VOLLEY OF I'S

Spectacular Threats Add Humor to Situation—Will "Sic" Government on A. L. A. M. and Sue Everybody—Maybe.

Only this week did it become known how truly joyous is the state of mind existing in Flint, Mich., where is located the automobile factory the general manager of which compelled newspapers to take notice of him by appearing before the Ways and Means Committee and supporting the plea of the importers for a reduction in the import duty on motor cars.

Circulation of the printed brief opposing any reduction in the tariff which was filed by H. B. Joy, president of the Packard Motor Car Co., and Benj. Briscoe, president of the Maxwell-Briscoe Motor Co., representing the American manufacturers, served to make public the extent of the eruption of Michigan gray matter. It is disclosed by a hitherto unpublished telegram to Mr. Joy from the general manager in question which is included in the brief, in which connection it is fair to remark that the gentleman is credited with holding the opinion that the way to obtain advertising free of cost is to "do something spectacular," as actors and actorines long ago discovered.

In his message to Mr. Joy, the Michigander summarizes all the dreadful things he says he contemplates doing not only to the Association of Licensed Automobile Manufacturers, but to its individual members. His company is on the roll of the organization but is in bad standing owing to its failure to meet certain obligations. In order to get on the roll, it bought the Selden license of a retiring member, but despite that trifling fact, the manager now declares: "I am not in sympathy with the methods and policies of the Licensed Association and I am unwilling to be a party to its attempt under a most craftily conceived and drawn contract, to monopolize the industry through control of a worthless patent."

Digitized by Google

He employs the personal pronoun throughout his telegram and further avows that "I desire a cancellation of my membership and am seeking such cancellation in the courts." But as he or his company signed an agreement to pay certain sums and is now being sued therefor, the mean spirit which binds him to the association despite his desires is apparent to all. Nor is this all that weighs so heavily on the personal pronoun's brain tank. For he wants it known that "I intend to lay the whole matter before the Department of Justice."

As if this awful threat is not sufficiently terrifying and spectacular, Manager "I" announces that "I intend to bring suit against the individual members of the association for breach of contract and for attempt to ruin my business," which, en passant, has been so badly damaged that it was never so large as this year—so large that the great green public is to be given a chance to participate in it for the modest sum of $1 per share, a price within the means of even clerks, farmer boys and rural preachers. Few mining stocks offer rarer opportunities. In his concluding flourish, the wielder of the personal pronoun tells what he says is the reason why he opposes the practically united American trade, and why he would have the tariff reduced and the door thrown wide open for the foreign car. It is simply because "I consider that the present duty is a most outrageous extortion upon the buyers of large cars," hence his marvelous benevolence and desire to save money for the hungry and suffering millionaires.

The brief, which save for some correspondence, merely puts in printed form the facts and figures previously made public and printed in the Motor World, includes also a copy of a trenchant telegram from Benj. Briscoe to the lawyer who had preceded by several days the manager of personal pronouns before the Ways and Means Committee; the lawyer is generally supposed to have been in the employ of the Michigan manufacturer. In the course of his speech, the attorney implied that "a considerable portion of the industry is favorable to a tariff reduction on automobiles." Mr. Briscoe was polite. Instead of using the short and ugly word, he wired the lawyer that his statement was "not in accordance with the facts," and continued:

"I challenge you to produce any and all telegrams you referred to, substantiating your representations; I cannot believe that you would deliberately distort the facts, or that you intend purposely to convey a wrong impression, and I, therefore, await with interest a statement from you that will be supported by facts."

The attorney's response was in keeping with the practices of his profession. He said:

"Have requested an auto manufacturer who has written me that your proposition is silly to answer you direct. Also two others say that one-half of present duty is enough."

FELICITATIONS AT SHOW LUNCHEON

Success of Palace Exhibition the Theme of Bright Speeches—Compliments for Manager Reeves.

That the long list of automobile shows which have been held during the past decade not simply have had the effect of instructing the public and of impressing upon it the magnitude and importance of the growing industry, but that they also have served as a "clearing house for ideas" developed by individuals connected with it, was one of the sentiments expressed at the annual show luncheon of the American Motor Car Manufacturers' Association, which was held at Hotel Manhattan on Tuesday, 5th inst. The fact that the shows have served this purpose has frequently been commented upon, but it was not until the industry had reached its present firmly established position that it became possible to realize the great importance of just that service.

With a couple of hundred members of the association and their invited guests present, and a spirit of absolute peace and accord the affair passed off amid a host of felicitations on the success of the present show, the occasion being all the more one for rejoicing because it is the first show in which the A. M. C. M. A. has reigned supreme and alone. Indeed, so much of harmony prevailed that none of the criticisms of the industry or suggestions for its future conduct were offered which have signalized the utterances at former occasions of a similar nature.

Much gentle mirth was provided by Counsel Job E. Hedges, of the association, who, among other things, congratulated the organization upon its display of "almost human intelligence" in hiring an attorney as its first act. His mood was echoed by Benjamin Briscoe, chairman of the association, who, in the latter part of his remarks, paid a glowing and justly deserved tribute to the forceful and energetic service displayed by manager Alfred Reeves in his administration of the affairs of the show. Briscoe said in expressing the welcome of the A. M. C. M. A. to its guests:

"We are especially glad to notice here several who do not happen to be in our own particular household of faith, though I am pleased to say we are getting closer and closer together. Did it not appear vain, I would congratulate the entire automobile industry on the great success of this show, but just bear with me when I say, 'They have got to go some to beat it.'

"Surely it is, in attendance, in business interest manifested, in completeness of preparation, one of the greatest automobile shows ever held in this country. Publicly and here I want to thank the Show Committee members, Messrs. Smith, Hollander, Post, Owen and Mora, for the good work that they have done.

"I feel impelled also to voice the most universal thought held in connection with this show. We all know that it is a more valuable attribute to be able to pick 'good ones' than to be 'good ones' yourselves. The Committee of Management of our association picked out out not only a 'good one,' but one that makes good anywhere you put him—a manager 6½ feet tall in sincerity, in judgment, in intuition, and in energy, and in all else that goes to make a true, a noble, and an efficient man. Mr. Manager Reeves, on behalf of this association and on behalf of the exhibitors I thank you most heartily."

H. O. Smith, chairman of the show committee, it was who defined the full utility of the show already given.

"While this industry has already taken a position of prominence among the first in the country, who would attempt to predict its limitations five or ten years hence?" he said. "The automobile shows have unquestionably supplied their part in the great march of progress. While it is a fact that most practices employed in the modern motor car are old mechanics, being merely put to new uses, yet experience was necessary to guide the builders in determining the conditions to be met and the best way to overcome the obstacles.

"The shows have proved a clearing house for ideas, until today with the wonderful fundamentals charcterizing each type we can agree that we have gone far toward standardization. The shows have also had the effect of not only interesting the public in motor cars, but impressing the importance and magnitude of the industry. May I add in conclusion that the management feels grateful to the exhibitors, the dealers and patrons who have contributed to the success of the Ninth International Automobile Show and made it the greatest ever held in point of attendance, general interest and actual business transactions."

Robert Lee Morrell, representing the Automobile Club of America, rendered a tactful compliment to the A. M. C. M. A. on its success in "going it alone," after its several years of joint management with the automobile club. Other speakers who contributed their share of merriment and optimism were Henry H. Duncan, who voiced the gratitude of the dealers to the management, and S. H. Mora, of the show committee. As mementos of the occasion the guests were presented with ash trays of artistic design, which were well worthy of their purpose of serving as souvenirs of the show season.

Merrick Starts for European Visit.

George P. Merrick, resident director of Spare Motor Wheel of America, Ltd., manufacturer of Stepney wheel, sailed for Europe yesterday. The chief purpose of his visit is to attend the directors' meeting, which takes place January 15th, at Cheltenham, England.

EXPORTS RESUME UPWARD TREND

November Gains in Sharp Contrast with October Losses—The United Kingdom and Mexico Show Recovery.

Statistics of exports for the month of November present some gratifying contrasts to the figures for the preceeding month. The total of business for the month was $187,920, as against $173,552 for the corresponding month last year, a gain of $14,368, as against a decline of $104,328 in October shipments. To this gain the United Kingdom, which contributed largely to the previous month's loss, contributes a gain of $7,480; while Italy, which was one of the brightest spots in that month, repeats its good showing by another jump, from $315 to $16,000. Germany advances from $6,136 to $7,337. South America again shows a decline, from $12,014 to $5,567, but Mexico redeems herself from the October falling off by an increase from $15,662 to $34,359. Other gains are shown in British North America, the West Indies and Bermuda, Africa and Other Countries. France declines from $26,304 to $9,418.

For the eleven months ending with November the total is $4,684,423, as compared with a total of $5,455,540 for the corresponding period in 1907. Only two of the geographical divisions show a gain, Other Asia and Oceania advancing from $91,162 to $118,491, and the division known as Other Countries nearly doubling its purchases, the figures being $22,084 as against $11,466 for the corresponding period last year. The heaviest losses are in Mexico, which declines from $573,116 to $283,395; British North America, from $1,145,564 to $1,075,366; West Indies and Bermuda, from $249,637 to $159,586; British Australasia from $175,356 to $75,831, and Other Europe from $272,290 to $204,178.

The following table shows the record in detail.

	November		Eleven Months Ending November		
	1907	1908	1906	1907	1908
Automobiles and parts of	.....	.....	*$2,356,110	.....	.....
†Automobiles	$142,946	$145,070	‡1,610,426	$4,861,622	$4,116,476

Credit Association Chooses Directors.

At a meeting of the Automobile Trade Credit Association, at the Murray Hill Hotel, New York, on the 5th inst., W. B. Lasher, of the Weed Chain Tire Grip Co., and W. P. Berrien, of the Firestone Tire & Rubber Co., were chosen as directors to succeed themselves, while E. C. Wilcox, of the Connecticut Telephone & Electric Co., became a new member of the board. The election of general officers for the Association takes place on the first Tuesday in February.

Continental Gives Its Forces a Spread.

Among the semi-private trade gatherings during the week of the Palce show was a luncheon tendered by the Continental Caoutchouc Co., of New York, to its sales force and representatives. The spread took place in the Indian room of the Hotel Astor, New York, on Tuesday, 5th inst.

American Leatherette Creditors to Meet.

W. H. Hotchkiss, referee in bankruptcy of the American Leatherette Mfg. Co., Buffalo, N. Y., has called a meeting of the creditors for January 20th. After the meeting, if no objection is entered, the property will be offered at public sale.

L'Hommedieu Joins the Apperson Forces.

Wallace L'Hommedieu, formerly with the Autocar Co., and the Electric Vehicle Co., has recently joined the forces of the Apperson Bros. Automobile Co. He will act as general traveling representative.

To Represent Columbia Nut in New York.

Daniel L. Tower, 107 Chambers street, New York, has been appointed metropolitan sales agent of the Columbia Nut & Bolt Co. He of course will carry a full stock of the famous Columbia lock nuts.

Maxwell-Briscoe Will Try Spare Wheels.

The Maxwell-Briscoe Motor Co. have placed an order for 50 Stepney spare wheels. It is their purpose to give them an exhaustive trial.

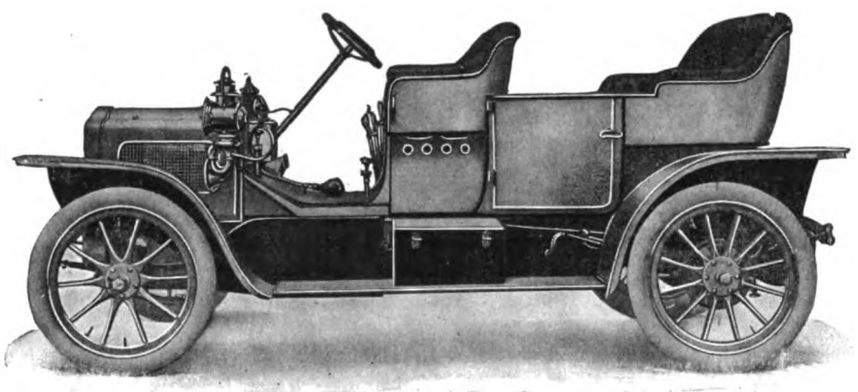
POPE MOTOR CAR SOLD AT LAST

New Toledo Corporation to Take Over Old Company—Final Court Hearing Fixed for January 11.

After a long period of uncertainty, the Pope Motor Car Co., of Toledo, O .i,s to be sold to The Toledo Motor Co., a corporation which has been formed for the purpose of making the purchase. The latter has been incorporated under the laws of Ohio, with $10,000 capital for the present, but the identity of the men back of it is not as yet disclosed. The order for the sale by the receivers of the Pope Motor Car Co. of all the company's property and assets to the Toledo company was given on the 30th ult. by Judge Robert W. Taylor in the Circuit Court of the United States for the Northern District of Ohio, Western Division.

It appears that the Toledo company owns claims aggregating $850,000, which were formerly held by the receivers of the Pope Mfg. Co., of Hartford, Conn. These claims are to be paid only after all the proved claims of other creditors have been satisfied, according to the order.

The proposed sale came before the court in the form of a petition by the Toledo Motor Co., asking for the necessary court permission. The receivers recommended to the court that the petition be granted, and the court expresses itself as satisfied that not only all the stockholders but a very large majority of the creditors have approved of and consented to the arrangement. A final hearing will be given at Toledo on the 11th inst., at which such objectors as there may be, must show cause why the sale should not be made.



Maxwell Selling Forces Hold Reunion.

Maxwell agents and sub-agents gathered several hundred strong at the Hotel Manhattan on Tuesday, 5th inst., for the annual dinner and reunion give by the Maxwell-Briscoe Motor Co. Lee B. Durstine was the toastmaster of the occasion. The first speaker was Benjamin Briscoe, president of the company, who in a "brotherly" talk on "Team Work" gave a review of the past, an estimate of the present, and an outline for the future, his remarks being lightened by humorous illustrations. Designer Maxwell told what he had seen on his recent trip abroad so far as motor cars are concerned, and C. W. Kelsey talked about "Hustlers." Ernest Coler, advertising manager, impressed on the agents the value of publicity, while Auditor Wellington thanked them for the promptness with which they turned in the dollars. Cresswell McLaughlin's topic was "The Battle of the Markets." Agents not only from all parts of the United States, but from Canada and from Cuba were present.

THE WHITE STEAMER IS THE ONLY CAR

of distinctively American design

The White is the only car which is not a copy or an imitation of some foreign product. In almost every class of machinery—typewriters, sewing machines, agricultural implements, machine tools, etc.—American ideas of construction have eventually proved triumphant and so it is with the White Steamer. The White is sold in quantities abroad in competition with the home product and, as regards this country, there are more Whites in use than any other make of large touring car.

The White possesses so many points of superiority over other types of automobiles that any one who purchases a car without first investigating the White is acting with only a partial understanding of the possibilities of automobile construction. We can meet the requirements of almost any pocketbook with either our 20 horse-power car at $2000, (shown above) or our 40 horse-power car at $4000. The United States Government, the most discriminating of purchasers, owns more White Steamers than all other makes combined. Our cars are used by the War, Navy and Executive Departments.

Write for descriptive matter.

NEW YORK, JANUARY 7, 1909.

The Motor World's Forecast of the A. L. A. M. Show will bear the date of January 14th. The full report of the show will appear on the 21st.

Building for Utilitarian Service.

Whatever may be said of the developments, structural and otherwise, revealed by the greater automobile shows the careful observer will note with growing satisfaction each year, and this year in particular, that the utilitarian phase of automobile construction is taking effect in every designing room and every shop and so is evidenced on the cars as they are presented for review, in a degree which is as impressive as it is gratifying. The principle is not necessarily that of the development of the car intended solely for commercial purposes, but of the kind of development which makes for better and more convenient service to the user regardless of the application he may happen to make of the vehicle itself. Never before has such attention been paid to the perfecting of small details; never before have questions of speed and power and luxurious appointment been subordinated in such degree to the practical side of bringing up the small details to the highest possible plane of practicability.

Thus in pleasure cars, provisions for the safe yet accessible location of parts and supplies such as spare tires, batteries, tools and luggage are found almost universally, even in cars which are marketed at a very moderate price. Better arrangements and mountings for the equipment, as in the ironing for tops, the methods of installing gas tanks and generators and the use of substantial door latches and other tonneau fittings are found.

In a measure, this tendency may be regarded as engendered by the growth in the extent and elaborateness of the equipments which are furnished with the cars, or perhaps to the activities of the accessory makers who are constantly improving upon their wares. At the same time, the fact that in lubricating systems, ignition systems, carburetters and even entire transmission groups provision is found for long periods of service practically without attention; for better accessibility to parts than ever before, and for ready removal of affected or injured organs; points rather to a growing appreciation on the part of the manufacturer that he must make a car that will afford its owner a maximum amount of service with a minimum of attention. Even the vast developments in the use of interchangeable parts which are so constituted in the strictest possible sense may be argued as favoring the user quite as much as bringing factory economies to the maker.

In the purely commercial field, of course, this principle finds its most evident outlet. There, it is observable that designers are viewing their problems directly through the eyes of the user, and striving in every possible way to anticipate his wants and his exigencies. Hence, the broad adoption of systems whereby whole power plants may be removed and replaced in a few moments, the use of more direct mechanisms than ever before, and the complete independence of chassis, power plant and mechanism of control from the load-carrying section of the vehicle. The old idea of adapting devices which have worked out well in pleasure car practice appears to have been abandoned almost completely, and the commercial cars of the day are manifestly designed through and through for the duties to which they are destined to be assigned.

Locating the Drivers' Seat.

Questions of the relative advantages of vehicle control from the right or left hand side, so thoroughly thrashed out during the earlier formative period of the industry are again coming to the front with the appearance of not a few cars which feature left control, and in particular with the rapid springing up of the many forms of town car and cab especially devised for commercial uses. Formerly the chief points of argument, pro and con, were in regard to the advantages of sitting on the left when meeting opposing traffic and of convenience in manipulating the mechanism of control when in that position. The introduction of the left-driven taximeter cab, however, has brought with it an added point to be discussed, and an objection which superficially at least, appears to be more or less reasonable.

In a word, when a commercial vehicle is drawn up to the right hand curb and the "fare" is about to alight, the driver is able to open the door without leaving his seat, if that be on the right side, while if it is on the left he is forced to execute a quick scramble across the foot board in order to anticipate the pasengers' movements. Further, if the gear and brake levers are located in the centre of the foot board this is rendered a difficult if not impossible feat.

The opening and closing of cab doors is a custom which has arisen with the taximeter in public service and which may not be considered vital to the success of the motor cab in public service. At the same time, since it exists as a common practice, it must be considered when all the conditions affecting the positioning of the driver are taken into account. Perhaps the designer who is bent upon the use of left control and who also desires to cater to the flunky habit among chauffeurs will incline to use either of gear control mounted on the steering column, or of a system of all pedal control such as is possible with the planetary type of gear. Otherwise he must resort to the use of the levers mounted on the left side, thus partially blocking the driver's more natural point of ingress and egress. Trivial as the objection may seem, where every inch of space on the vehicle must be figured over and over to put it to the best possible use, and where not only the driver's accommodation, but frequently a fair amount of

Digitized by Google

open space for luggage must be provided for, even such small considerations as cater to the handiness with which the operator can collect his fare are worth thinking of.

Siamese Twins and Godfathers.

What they term their Special Show Issues fully entitles the parents of those Siamese twins of automobile journalism, The Automobile and The Motor Age, to all the remark they may create. Not because they differ chiefly in respect to the color of their covers, not because the show was "written up" long before its doors were opened, not because the pages were splashed with red ink and green, nor because the price of the "special issues" were raised 150 per cent., but because of the wholly original "sandwich effect" duplicated by each of the "twins" and which constitutes a striking departure in journalism.

When any publisher can slip here and there a page of reading matter between 30 or 40 pages of advertising and call each a "section" or "department," and repeat the same matter in two apparently distinct and separate publications and "get away with the goods," he performs an achievement which justifies him in increasing the price of such sandwiches not 150 per cent., but 550 per cent., even though it may seem to lend substance to the notion that in some publishing institutions all else is secondary to the accumulation of advertisements. And when "twins" are supported on the right by Blue Books and on the left by directories, all operated by the same prestidigitators, their dexterity appears the more astonishing—so astonishing that it would seem that godfathering an embryo official organ of the American Automobile Association should be, even if it is not, undertaken with considerable timidity. Even a gentle and much milked cow wearing blinders has been known to kick over the pail, even when milked by trained hands.

We respectfully suggest to the parents of the Siamese twins and of their right and left supporters, that there is grave danger of a mishap of the sort, particularly if when godfathering a marvelous, but unborn "official organ" it is maintained that it will come into the world with 20,000 subjects on its circulation list. Some wise man may be apt to discover that the United States government requires the payment of a subscription fee and a signed order from each individual member of an organization before its official organ will be entitled to pass through the mails at publishers' rates.

ENGINEERS IN ANNUAL SESSION

Principles Governing Traction Loss the Main Topic of Discussion—Papers Read and Officers Elected.

What had been programmed as a series of demonstration tests on the Automobile Club of America's car dynamometer resolved itself into an animated and protracted discussion of the principles governing traction resistance and the effect upon traction losses of the sizes, shapes and surfaces of tires, when the Society of Automobile Engineers assembled at the automobile club on Tuesday, 5th inst., for its fourth annual meeting. It had been intended to run off a series of trials upon the dynamometer in addition to inspecting its mechanism. Because of the large number of members in attendance, however, as a result of which the operation of the various portions of the exceedingly complex device could not be observed with any degree of satisfaction, adjournment was made to the reception room of the club where an informal discussion of the merits of the dynamometer was introduced, which finally merged into a useful debate on the topic outlined.

The subsequent discussion bore upon the contention that the varying degrees of power lost through variations in the tire mountings of different cars, would be sufficient to overthrow the dynamometer readings as indices of the power losses in their transmissions. Not only tires of different makes, but different tires of the same make are responsible for varying losses at the driving wheels.

It long has been well known that tires were responsible for a difference in the mileage of an electric vehicle, frequently amounting to as much as 60 per cent., where a specially light, single tube type was employed, as compared with what is known as the regulation "gasolene" type of tire, or one consisting of a separate tube and a heavy outer shoe. The use of any form of non-skid device, such as studs for example, is responsible for a further increase in the power loss at the road wheels, a series of tire tests now being carried on by Henry Souther, head of the technical committee of the club, showing that the amount absorbed at this point ranges as high as 2.5 horsepower per wheel in some cases, and drops very low in others, although as yet, there has not been sufficient time to test more than a limited number of types.

At the election of officers which took place during the business session these officers were chosen for the ensuing year:

President, Henry Hess, Hess Bright Manufacturing Co.; first vice-president, Russell Huff, Packard Motor Car Co.; second vice-president, B. D. Gray, American Locomotive Co., and treasurer, Allan H. Whiting. The two managers for the term of three years, to fill the vacancies expiring at this meeting, were David Ferguson, George N. Pierce Co., and Prof. R. C. Carpenter of Cornell University.

A paper on "What Constitutes Ignition Reliability," by A. Atwater Kent, was read by the author, who illustrated various points by means of apparatus devised especially for the purpose, and Thos. J. Fay, the retiring president of the society, brought out some interesting points on "The Modern Trend of Brake Design," prepared by himself and Lawrence Whitcomb. The meeting was adjourned until January 19, when a second session will be held at the same place.

COMING EVENTS

January 16-23, New York City—Association of Licensed Automobile Manufacturers' annual show, Madison Square Garden.

January 21-31, Los Angeles, Cal.—Automobile Dealers Association's show.

January 25-30, Cincinnati, O.—Automobile Dealers Association's show.

January 27-February 3, Philadelphia, Pa.—Automobile Trade Association's eighth annual show, Second Regiment armory.

February 6-15. Chicago. Ill.—National Association of Automobile Manufacturers' Show, Coliseum and First Regiment Armory.

February 15, Detroit, Mich.—Detroit Automobile Dealers Association's show, Wayne Pavilion.

February 15-20, St. Louis, Mo.—Automobile Manufacturers and Dealers Association's annual show.

February 15-20, Cleveland, O.—Automobile show, Central Armory.

February 16-18, Denver, Col.—Denver Motor Club's first annual show, Auditorium.

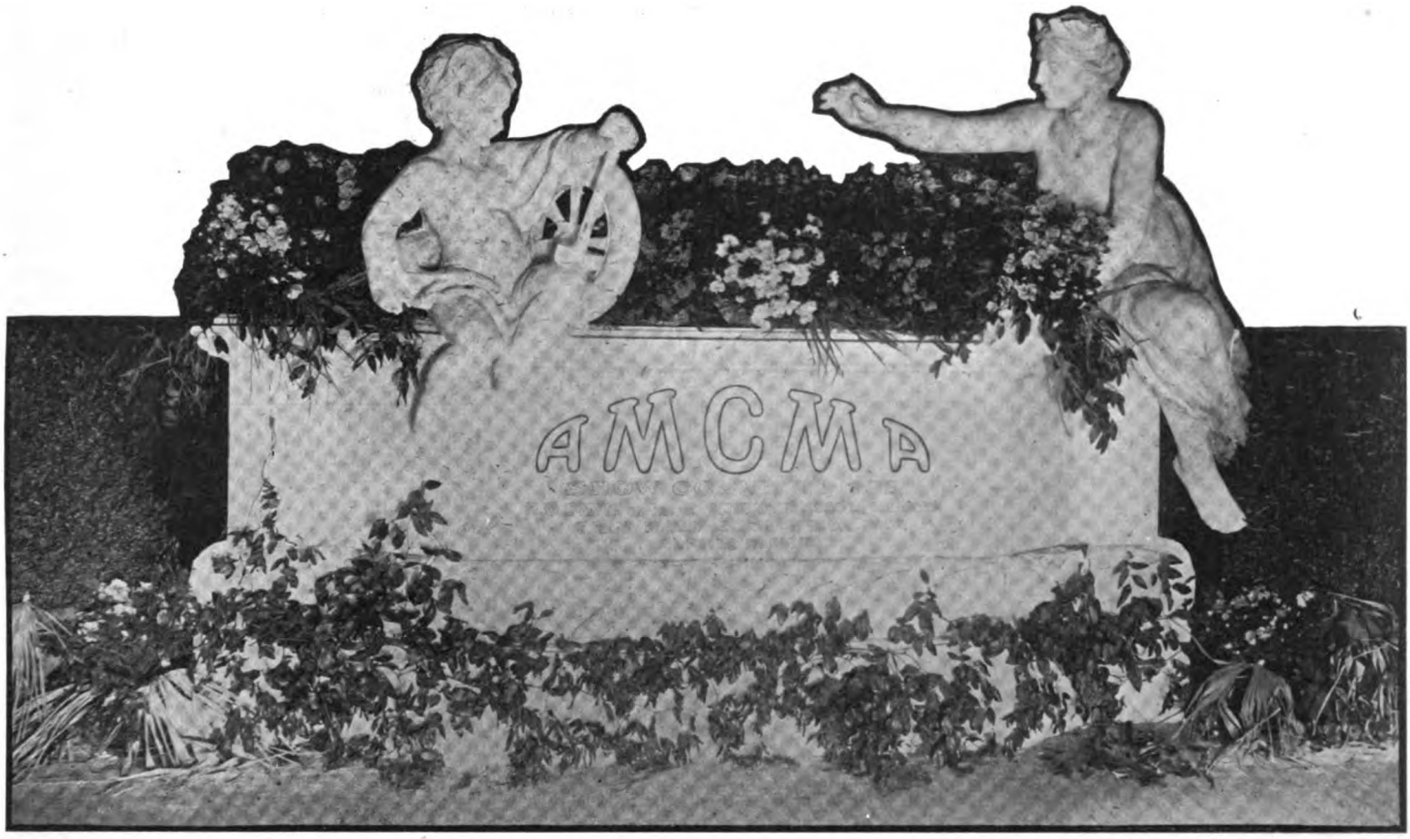
February 20, 21, 22, New Orleans, La.—New Orleans Automobile Club's Mardi Gras carnival 3 days race meet.

February 22, Cleveland, O.—Cleveland Automobile Dealers Company's show, Central Armory.

February 27-March 3, Hartford, Conn.—Automobile Dealers' Association show.

March 1-6, Omaha, Neb.—Omaha and Council Bluffs dealers' show, Auditorium.

March 6-13, Boston, Mass.—Boston Automobile Dealers Association's (Inc.) seventh annual show, Mechanics Building.



March 8-15, Kansas City, Mo.—Dealers Association's show, Convention Hall.

March 10-13, Memphis, Tenn.—Automobile show, Auditorium building.

March 15-20, Rochester, N. Y.—Rochester Automobile Dealers Association's show, Convention Hall.

March 27-April 3, Pittsburg, Pa.—Automobile Dealers Association's show, Duquesne Garden.

The Palace Show a Picture of Progress

For the sake of the "independent" shows that have gone before it was unfortunate that the American Motor Car Manufacturers' Association was content to remain the silent partner of the Automobile Club of America. For it is simple justice to say that the association's show in Grand Central Palace, New York, which was opened on Thursday evening last and which will hold the boards until this Thursday night, is so far superior to all of its predecessors, that in the light of today they seem useful chiefly for the purpose of comparisons. This, of course, refers to the setting —the "dress" of the shows. The exhibits of other years may have been the equals of those now in evidence but never were they "set off" to such advantage. Clothes may not make the man but they have much to do with creating impressions and with the formation of opinions and the same is true of public exhibitions.

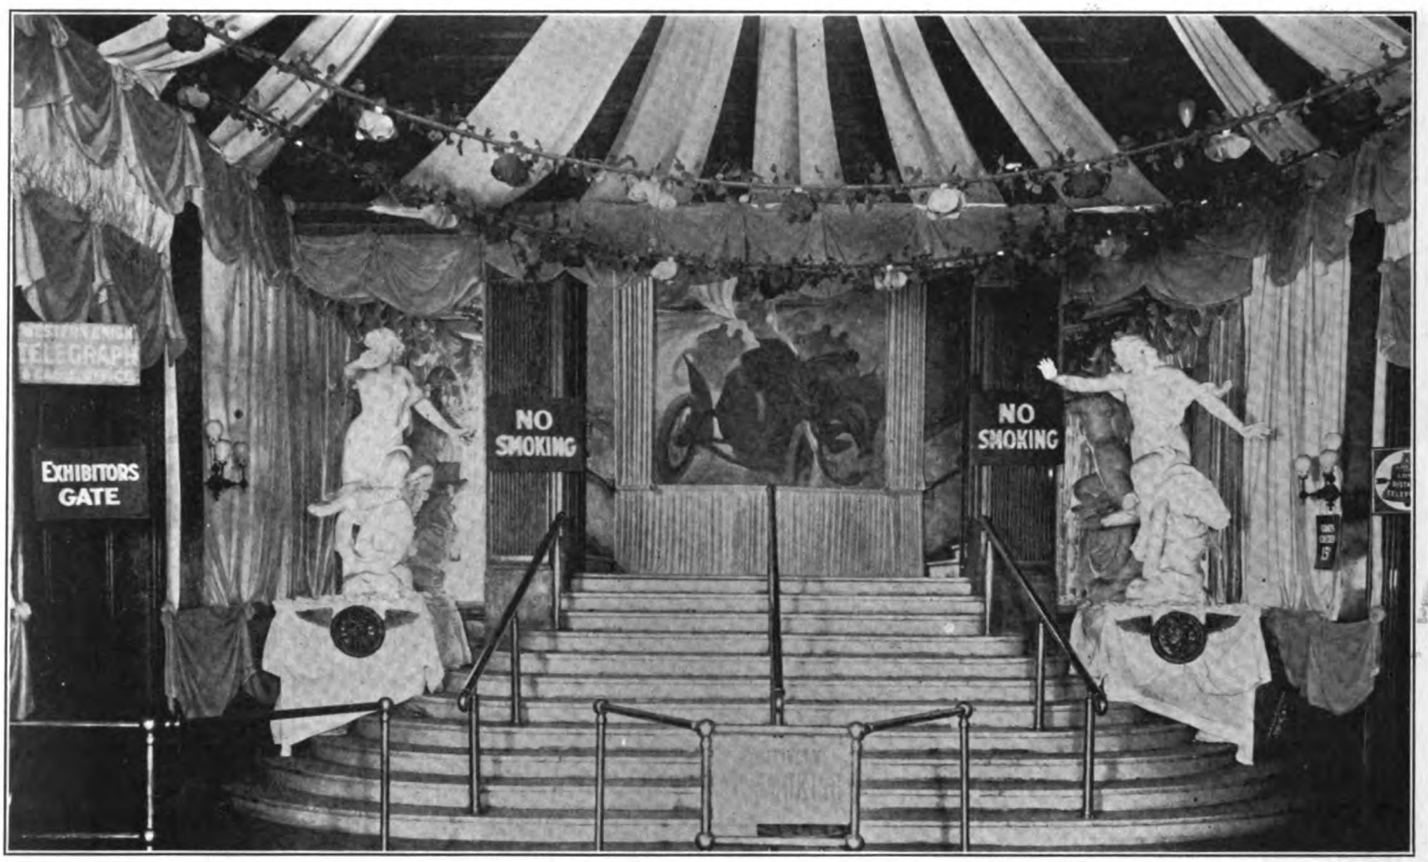
The dissolution of the "partnership" between the club and the manufacturers has proven of distinct and far reaching advantage to the Palace show. For the first time since that building was utilized for the purposes of automobile display, its dress is an unstinted credit to the industry. It is not only eye pleasing but it is clean and wholesome. The

PORTICO AT THE PALACE SHOW

Palace is not a structure that lends itself to effective embellishment. Its main hall is not very large and the wide overhanging galleries which overlook it from four sides do not contribute to picturesque effects, while the many ante-rooms and halls and their connecting halls, doors and stairways do not serve to make easy the way of the decorator. Despite these drawbacks he has accomplished wonders and the members of the A. M. C. M. A. show committee, which was responsible for his work, well deserve the monument—or "altar," as one captious critic described it—erected in the main hall and which bears their names.

Preliminary announcements had described it as the Great White Show and while this definition does not apply to the main hall, it tells the story of the remainder of the exhibition. The halls and ante-rooms all are dressed in white. White bunting hides the walls and pillars and is criss-crossed on the ceilings. The signs all are white with gold lettering and the same is true of the banners displayed by the exhibitors. The

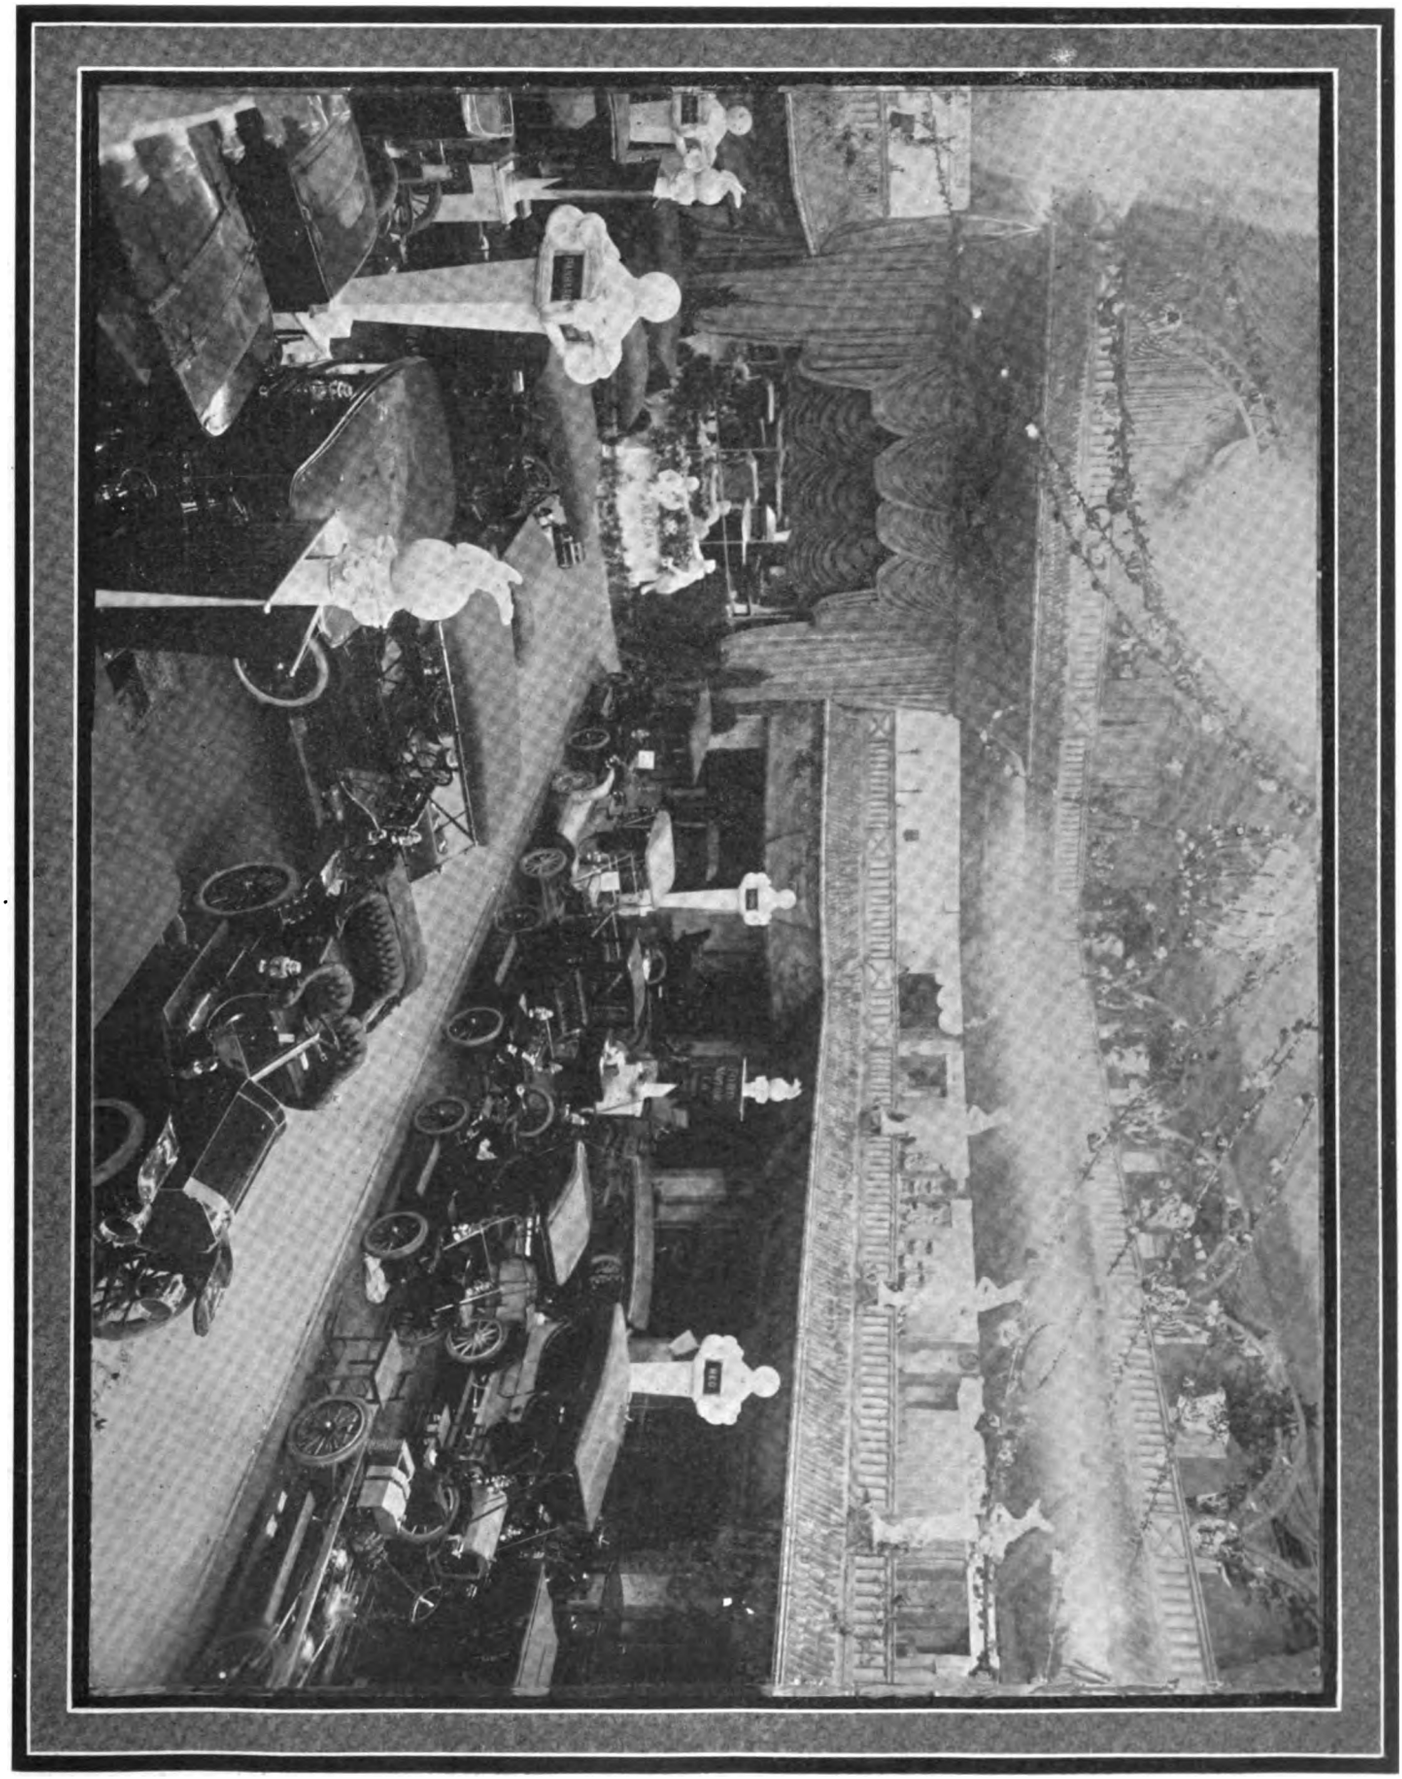
Digitized by Google



effect is a light, clean, wholesome atmosphere at every turn. It is a most agreeable change from the dark, depressing effect of the greens of last year.

By the nature of its interior plans, picturesque embellishment of Grand Central Palace is restricted to the entryway and the main hall and the galleries immediately overlooking it and it is here that the artistic hand has been brought to bear, as it never was brought before. Generous use has been made of white stuff in the form of statuary and otherwise. The columns of the permanent portico that is built out from the entrance have been covered with this material and four sad faced and hooded nuns—or they may be goddesses—are on guard; they, too, are of white stuff and each is holding in front of her a tire—whether Diamond, Hartford, Continental or other brand matters little, but at any rate it has no lugs. Overlooking the overhead porch itself is displayed a huge painting depicting an automobile scene. The marvelous transformation of the weatherbeaten portico is no mean achievement but it is not until one has entered the lobby of the building that he receives the first real impression of the beauty of the show. The lobby bears no relation to its everyday self nor to the practically bare and uninviting passageway of previous show times. It is bright and cheerful and well dressed. There are paintings on the wall and from the ceiling to the central cluster of light there are suspended ropes of evergreen in which are picked out glowing red blossoms—electric bulbs concealed by rose hued paper. Flanking either side of the main stairway is a lightly draped white goddess of heroic size and about whom there is nothing suggestive of the cloister. On the walls at the head of each of the narrow branching stairways not bare walls requiring kalsomining greet the eye but large colored paintings representative of some other automobile goddess and field of "life" and warm in coloring. If he is at his post, one of the few masculine adornments of the show will be seen at the head of the stairway—the page in Colonial costume, powdered wig, cockade, knee breeches and all.

Entering the main hall for the first time, the visitor to the Palace familiar with its interior on previous occasions immediately receives two distinct and surprising impressions—first, its unlooked-for beauty, and, second, its apparent great enlargement. The beauty is real, the enlargement is an optical delusion which, however, is not discovered on the instance or until it is seen that the further end of the hall is a huge mirror which affords an appearance of great depth, the effect being heightened by the artistic draping of rich orange over deep green which falls from a large panel picture of the American eagle grasping an automobile wheel and with the rays of the rising sun for a background. It is a conceit that were well worth while. It is immediately in front of this mirror that the "corner stone" bearing the names of the show committees is "laid" amid a simulation of turf. On the edge of the "stone" is perched a cherubic baby Vulcan, hammer in hand, and another of the numerous goddesses who with outstretched arm is coaxing the chubby youngster to "come across."



"Up aloft" the sky is of azure bunting from the mid-center of which depends a huge golden globe and a row of electroliers, each studded with scores of brightest incandescent bulbs. From the golden globe there radiates in every direction ropes of greenery "abloom" with glowing soft red flowers.

To obtain the full "picture effect" of the show, it is necessary to mount to the top gallery. From that vantage point, the scene is that of looking down through a trellis upon a square open court filled with motor cars, eaves of painted red tiling projecting from beneath each balcony, the railings themselves being concealed by a painted railing to conform with the early English effect. Beneath the eaves and set at an angle are panel pictures of outdoor automobile life. Overlooking the top gallery is a series of arched trellises picked out with small vari-colored bulbs and from the center of each of which appears a palm set in a white urn of massive proportions.

VIEW OF THE LOBBY AT THE PALACE SHOW

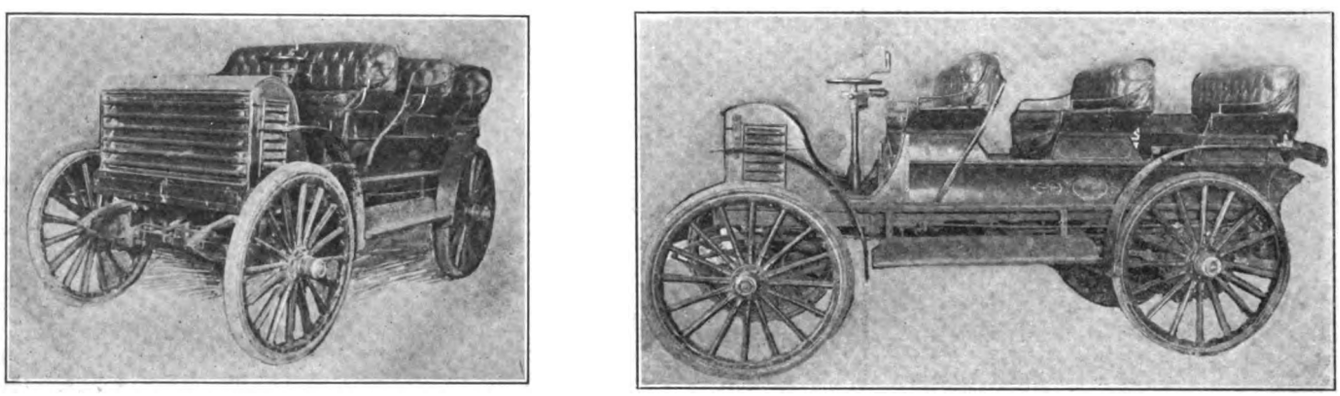
Digitized by Google

GENERAL VIEW OF THE MAIN HALL, PALACE SHOW

Digitized by Google

From the larger arched trellises at the ends of the gallery white cupids are suspended in space and instead of potted palms there are "flowering" roses and lilies—the flowers being electric bulbs concealed within transparent paper of the proper shades. In front of the railing itself is a series of crossed American and foreign flags pinned back by polished breastplates and other armor. On the first gallery, instead of trellises, the rail is broken at intervals by statues of goddesses holding aloft a winged wheel. It is on this gallery and overlooking the open court that such names as Hartford Rubber Works Co., Diamond Rubber Co., Badger Brass Mfg. Co., Splitdorf and others that stand high in the accessory industry. On the main floor and in the court itself stand the exhibits of Maxwell-Briscoe, Stoddard-Dayton, Premier, Mitchell, Ford, Reo, National and other bulwarks of the A. M. C. M. A., flanked on one side, but tucked under the overhead gallery, by the displays of foreign cars, the importers of which last year held a show of their own, and which was marked by a heavy fall of frost, as only the Motor World then stated. The importers, however, induced nearly all other publications to say that they were so "well satisfied" that their show would be repeated. Their present appearance in the Palace serves to demonstrate who told the truth.

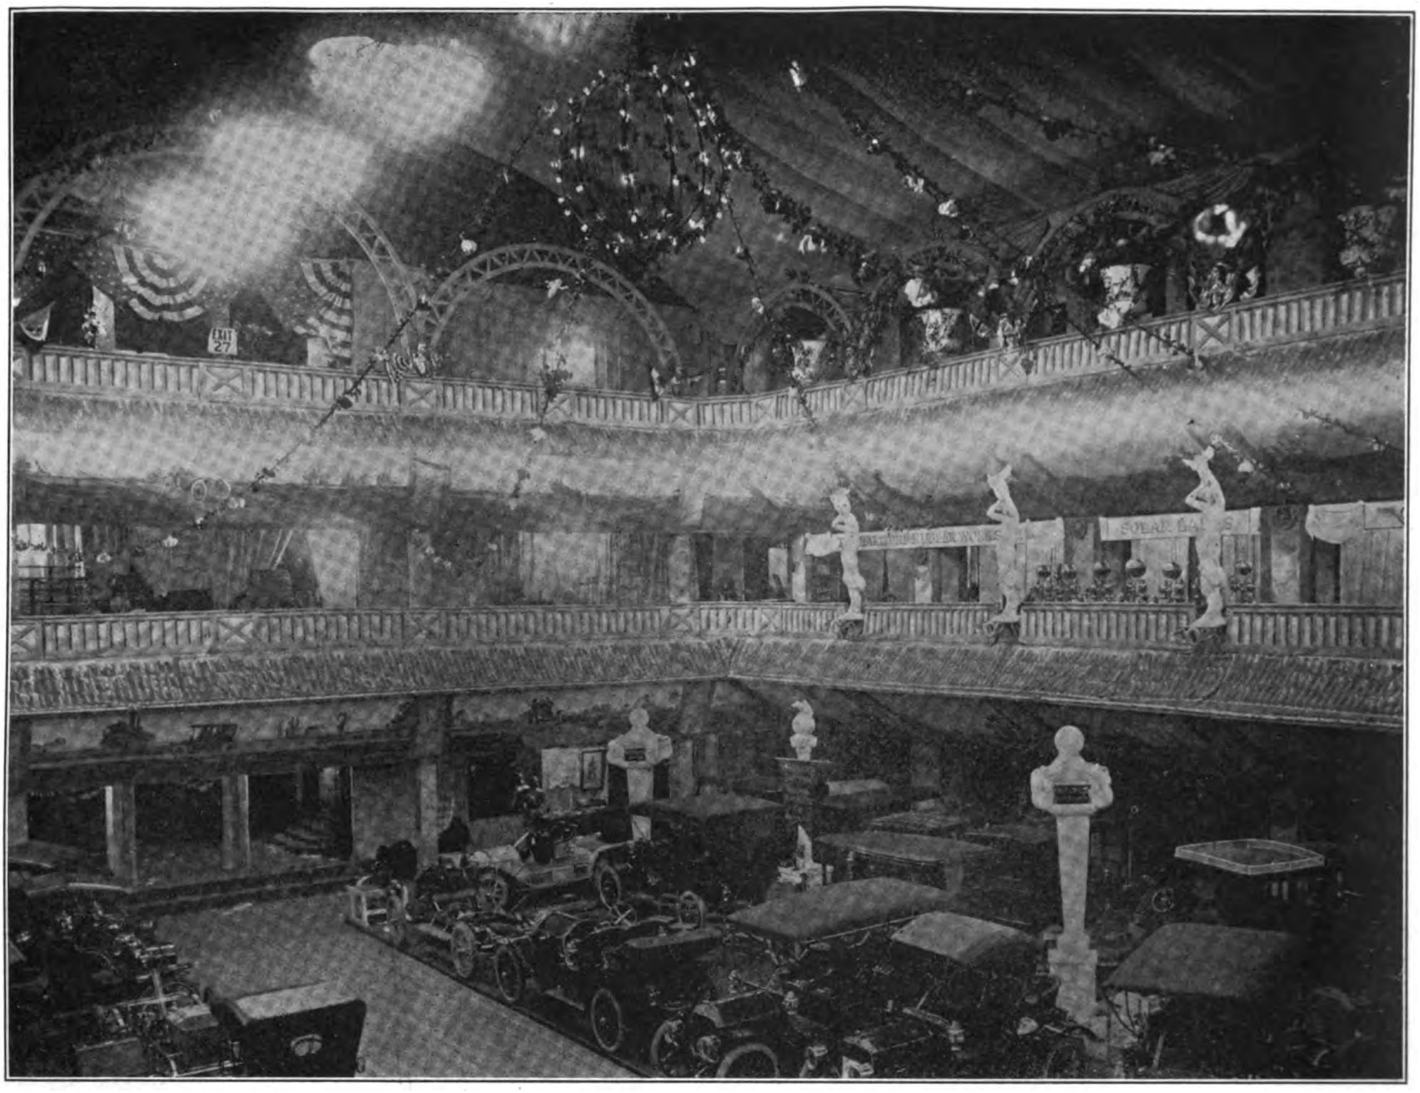
In the "court of honor," so to speak, the exhibits are distinguished not by white and gold signs but by red ones—red banners and subdued red box lights which form the tops of white columns, while the red banners are displayed on other white columns each topped by an eagle perched on a globe.



Word-description is, however, inadequate. The embellishment is too beautiful for mere pen and ink. It is carried even into the cafe, which takes the form of "Ye White Horse Inn," which with its tiled walls, "horsey" pictures and subdued lights looks the part and which even at first glance suggests Hoboken brew and ale, musty and otherwise, even if high balls may be more generally dispensed.

One small feature of the decorative scheme caused broad smiles on the part of the knowing ones and nowhere were they broader than in the booth of the Hartford Rubber Works Co. For as an added flourish or touch the decorator had seized on the familiar winged tire trade-mark of that company and had painted it on many of the signs in use throughout the building. It certainly does appear odd to find the Hartford mark alongside the names of competing tires.

Officially, the show opened Thursday evening, 31st ult., at 8 o'clock, and for the first time it was inaugurated with a show of ceremony. In the absence of Mayor McClellan, the Hon. Pat F. McGowan, president of New York's picturesque Board of Aldermen, and in the Mayor's absence the city's reigning official, escorted by Messrs. Owen and Hollander, was whirled up to the door in a Premier limousine and after being photographed entered the building and delivered a little speech. Despite his silk hat and evening dress, it was easy to recognize him as a member of Tammany Hall. He made his address gracefully, however, adding a few flourishes to the statistics with which he had been primed but saying nothing of moment or that will live in history. It did not take long for the building to become filled. Opening night always is largely a "complimentary night" and congested aisles are therefore the rule, to which last Thursday night was no exception. Since that time the attendance has been fully up to expectations. Speaking generally, the spectators appear to be of a better class than heretofore, that is, there seems to be more of those able to purchase automobiles and fewer of those whose chief asset is hope. The retail trade also is present in greater strength and it is significant that the West, that is west of Chicago, is more numerously represented than ever before.



There is no disagreement regarding the unusual and unexpected beauty of the show nor in respect to the better management. For the first time, the "no smoking" rule is being rigidly enforced and the friction arising from outdoor demonstrations has been avoided by the use of time checks. Nor does General Manager Reeves close his ear to any reasonable complaint or fear to take action when action is necessary as was proven on Monday when an exhibitor was ordered to "shut up shop" and get out forthwith. The offender was one of the numerous highsounding and alleged "owner's cooperative leagues" who had obtained space on the application stating that accessories would be displayed. As a matter of fact not merchandise but printed matter was the only thing in evidence, among i being a booklet painting the beauties of the cut-prices obtainable from membership in the "league." Twenty per cent. discount on two of the cars shown in the "court of honor" and also on the licensed car the manufacturers of which are so anxious to have the tariff reduced were among the quotations bulletined, while figures on many reputable sundries were cut to the bone. When the complaints reached Reeves he and the show committee acted promptly. They ordered the "league" to get out of the building without any delay, and he "got."

Except for a polished chassis here and there, most of the automobile exhibitors rely on their new and finished product to catch the eye. But an occasional weather-beaten car "stands out" by contrast. The little Brush that crossed the continent and en route climbed Pikes Peak, the Premier that covered 100 miles per day for 100 consecutive days and the Rapid truck that came to the show over the give and take roads between Pontiac, Mich., and New York, are among the number. In the foreign section several historic racing cars are displayed with a cup or two indicating their victories but the greatest display of such trophies is made by an American manufacturer—the York company. On a long shelf where all must see is displayed a striking array of silver cups attesting the prowess of the Pullman car. In the Maxwell-Briscoe booth are two added features, one neat and so small that it is kept under a glass case, the other lumbering and life-size, which may or may not some day have tremendous bearing on the entire industry. The former is a miniature model of a four-cylinder motor of conventional mould, complete in every detail, and said to be the smallest in existence. It is of the two-cycle type, water-cooled, fitted with jump-spark ignition and mounted on a section of a

TWO VIEWS OF THE WILKINS VEHICLE, WHICH IS CLAIMED TO ANTEDATE THE SELDEN PATENT

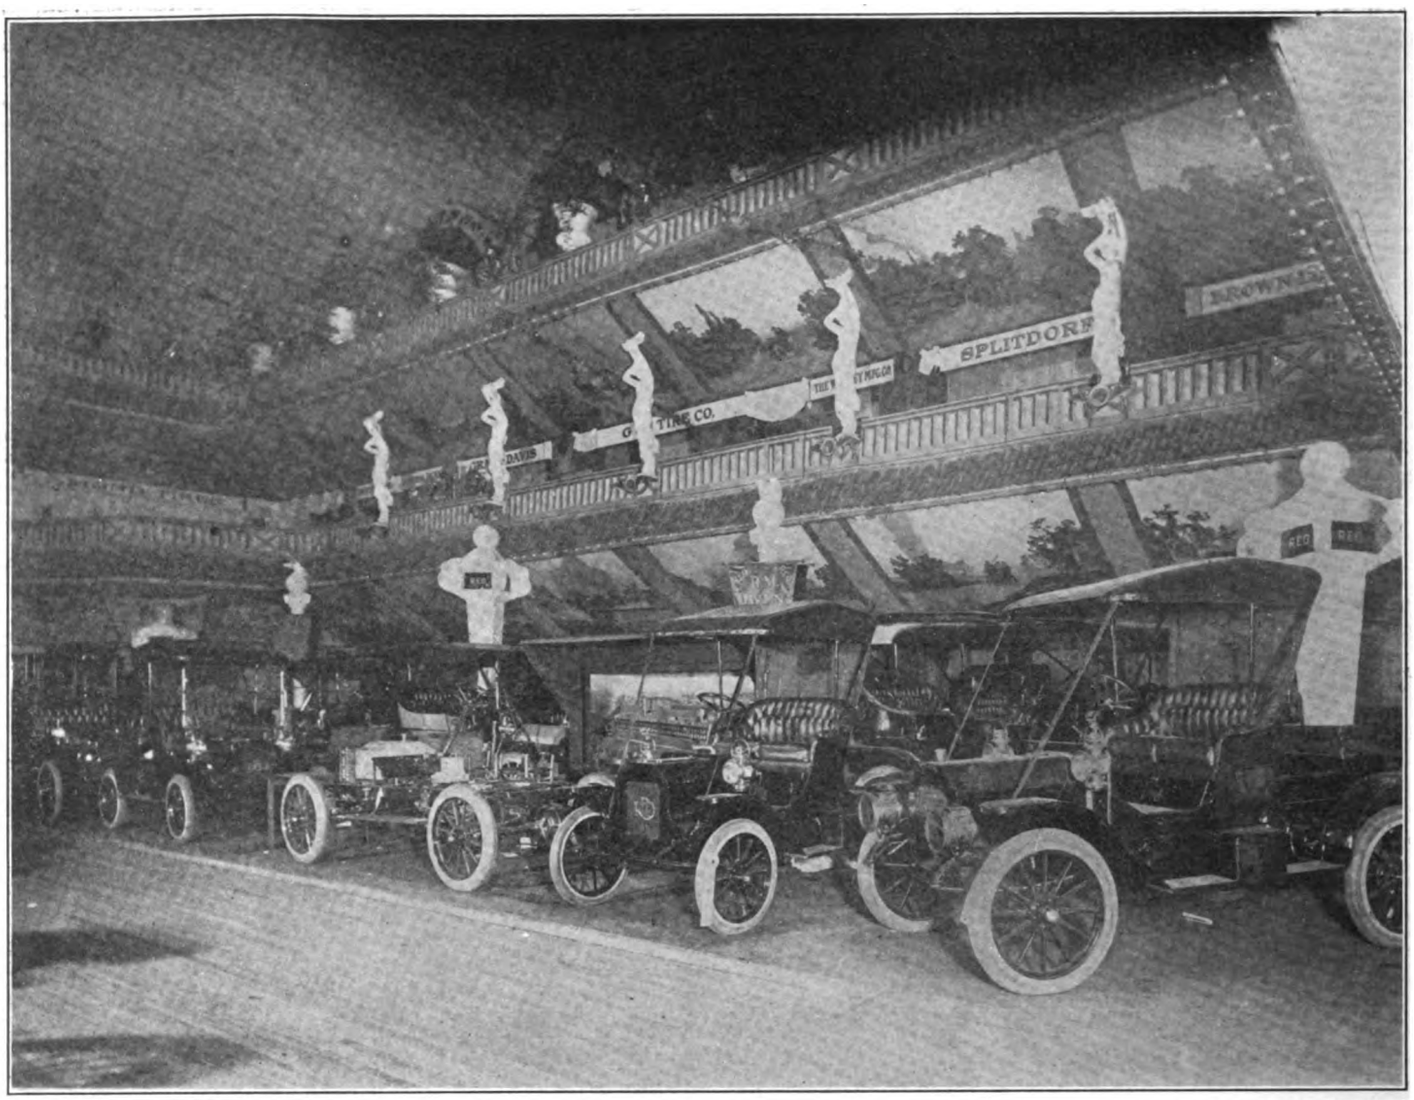
Digitized by Google

MAIN HALL, LOOKING TOWARD LEXINGTON AVENUE, AND SHOWING MITCHELL AND STODDARD-DAYTON EXHIBITS

chassis, in front of a tiny dashboard which carries the spark coil and the other accustomed fittings. The cylinder dimensions are 1½ by 1½ inches, bore and stroke, and the "A. M. C. M. A. rating" quoted is 3.6 horsepower. The model which is of excellent finish and wonderfully delicate workmanship, is the property of Adam Ziske, of Rockford, Ill. The lumbering and possibly momentous feature of the Maxwell display is a car discovered in California by Benj. Briscoe himself and which he declared is "the find of the century," in that it is claimed to ante-date the basic Selden patent by some three years. Mr. Briscoe states that he has authentic proof that the three-cylinder gasolene motor which is incorporated in the old vehicle was built and operated by J. W. Wilikns in 1876; the Selden patent was not granted until 1879. The Wilkins rig still is in working order; it is in its original state save for wheels and tires.

Of other striking "side attractions" is a De Luxe car with a glass hood—for show purposes only, of course—and a four-cylinder De Dion chassis with each and every working part sectioned or cut away showing its "internals" so that even the misinformed may get a good idea of what's what. Most of the real "action"—the working exhibits—are confined to the accessory displays. In respect to cars, a Stoddard-Dayton engine operated by an electric motor and showing the operation of the new lubrication system and working demonstration of the friction drives of the Lambert and the Carter car are the only evidences of action.

That portion of the show in which the cars were staged revealed certain characteristics—features which "stood out"—and which were to be interpreted as fingerposts of future development or as valiant efforts to get away from tradition, according to the sentiment of the visitor. Though not as numerous as in former years, the bearing of these striking departures from ordinary practice proved to have unsual significance—perhaps for that very reason.



There was, for example, a four-cylinder, air-cooled motor of opposed formation, but built without connecting-rods or cranks, without cam shafts or gears, and mounted directly on the transmission shaft, which furnishes the only medium of suspension except the necesary torque resisting member. It is the feature of the latest Holsman model, and forms one of the most compact gasolene motor units ever seen.

There was another motor innovation in the 60 horsepower, two-cycle of the American Simplex, said to be the largest motor of its class ever mounted in a motor car. There was, of course, the high-wheeled practice of the motor buggy adherents, brought to a head in the 40 horsepower, four-cylinder, Black roadster. But the movement for large wheels, which has animated the manufacturers of the more conventional types of car obtained its greatest advertisement in the new American Traveler, with its 40 by 4 inches tires mounted on front and rear whels.

Left hand control of the vehicle, long advocated by a number of constructors, now appears on a number of vehicles, thus rendered more or less conspicuous, such as the Ford, the Holsman and the Cleveland and Rockwell public service cabs.

The foreign section had its new system

Digitized by Google

NORTH SIDE OF MAIN HALL, SHOWING REO AND FORD EXHIBITS

of radiator construction, with fan enclosed within the radiator proper, which was mounted on the dash—this being an innovation of the recent Paris Salon, brought over on the newest models of the C. G. V.

There was an electric platform truck, designed for industrial purposes in transporting materials about large works and embodying a number of novel points. There were several examples of provision made distinctly for the purpose of demounting the power plants of commercial vehicles with a minimum loss of time and labor, and there was, of course, no small attraction for the young in the midget juvenile, and the smallest practical gasolene vehicle built, according to its builder's claims.

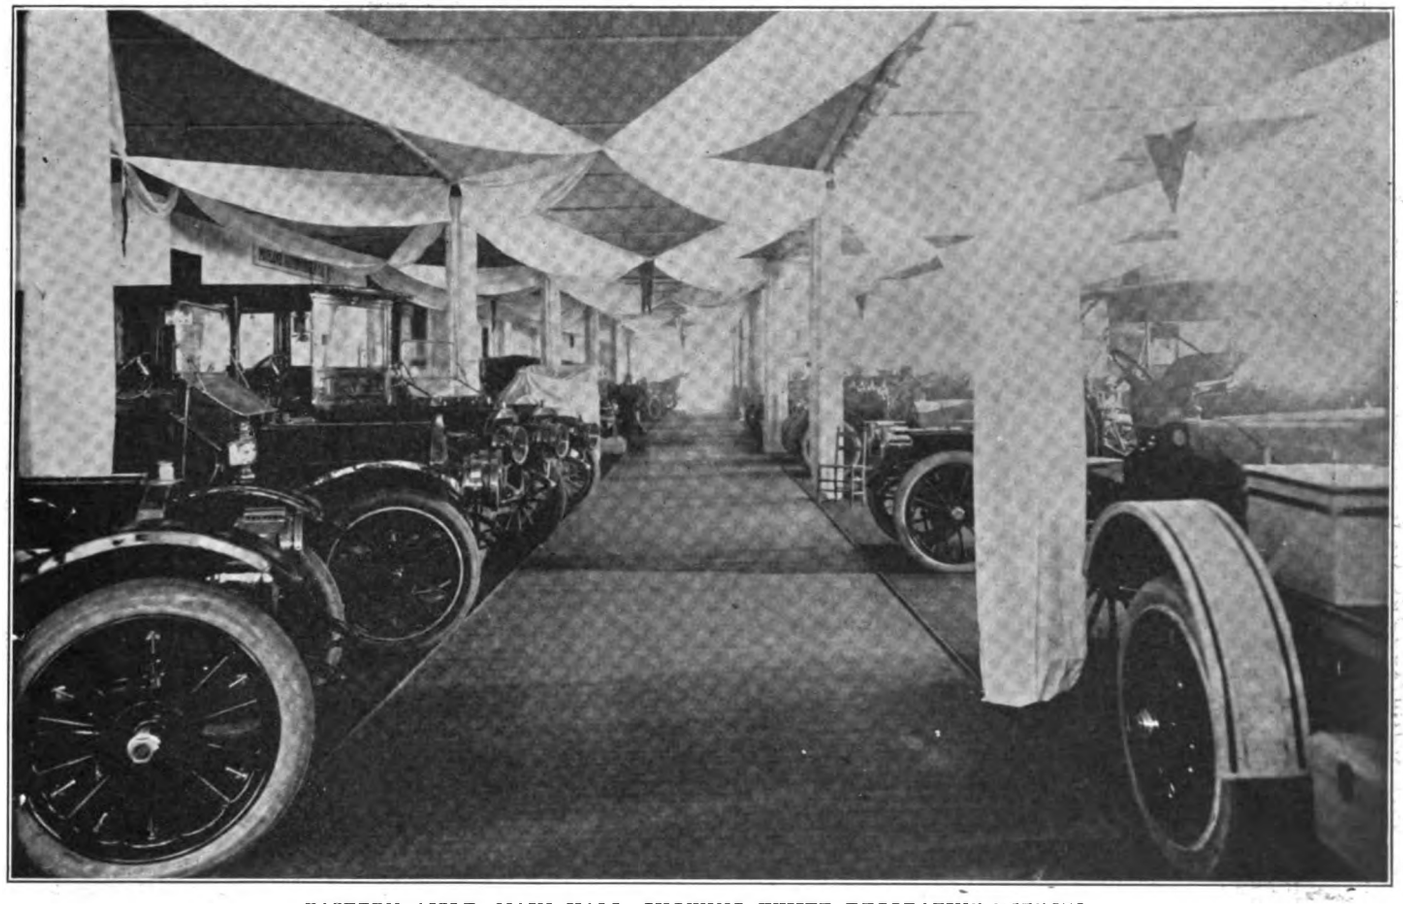
To hark back to the old assertion that the arrival of the period of standardization in the industry has brought with it an area of practical stagnation so far as thrilling or even general innovations are concerned it would appear that that opinion may be read with varying degrees of meaning, according to the viewpoint of the individual. The engineer, for example, even yet is able to discover a liberal assortment of new ideas bearing on the structure of the motor vehicle in one way or another, and in the solidifying and stratification of types, finds ample opportunity for study. The average owner, familiar with a moderate number of well-known cars, either through his own experience or those of his friends, is enabled to discover yearly improvements which are manifestly intended to eliminate certain fundamental drawbacks before in evidence. The more casual visitor perhaps unacquainted with the mechanism of even the most ordinary machines, still finds diversion in contemplating the construction and finish of the bodies, in which even his non-technical eye is able to discover important, or at least, conspicuous departures from previous practice.

Just so long as there are shows, there always will be enough in them to interest the visitor, and enough that is really new to make that interest of more than passing intensity. Only, because the appetite of the old-time show goer is cloyed with the surfeits of former years when each new model car was a radical departure from its predecessor, it is easy to say that there is nothing new to be seen this year, or next, or the year after.

BODY MOUNTING DEVELOPMENTS.

To begin with the beginning, that is to say, the visible, external appearance of the machines, taken at a general view, and returning to the unfortunate and hypercritical attitude of the critic who feels it his duty to discern and define in every section of the show some vestige of trend or tendency, be it gravely announced that body design is still trending. Further, be it understood that all previous forecasts are now authenticated and endorsed and that the development of the year, reinforcing that of the past two or three years, is gravitating slowly but surely into the paths formerly trod by the carriage makers. In the now familiar and omnipresent roadster runabout body, with its extremely modern version sometimes openly known as the surrey, is a practical and comfortable reincarceration of the old, horse-drawn type which for so long has gone by that very name. Whether in the guise of the snug little four passenger runabout, half motor space and hood and

Digitized by Google



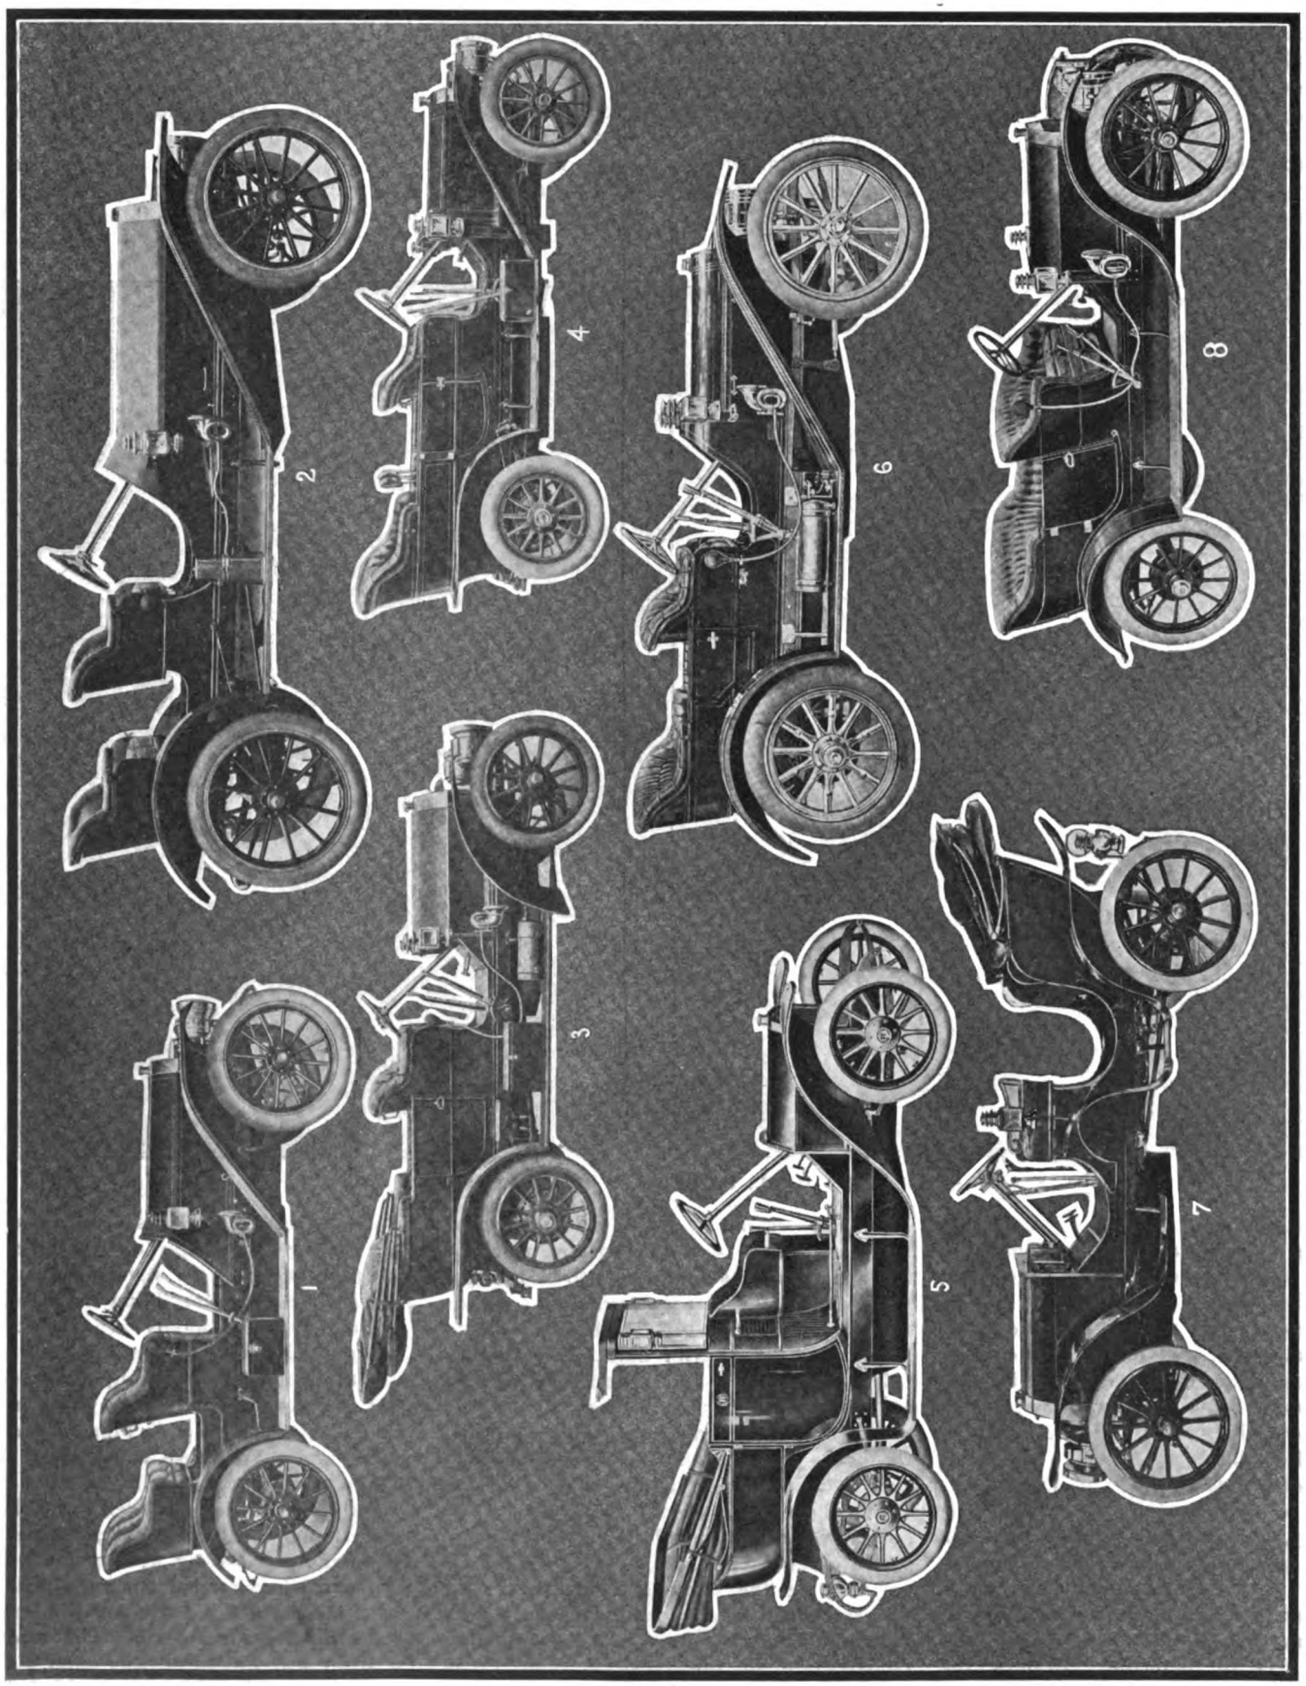
half passenger acommodation, or in the more formal close-coupled body with its little dinky rumble cocked up behind, it is plain to see that the clean-lined prints of the old carriage fashion plates have been studied and adapted, consciously or otherwise, but certainly with care and discretion in the draughting of many of the bodies of 1909.

In the more elaborate types of body there are still the tonneau in its various forms, five and seven seated, savoring broadly of the tonneaus of previous seasons, but improved mightily even from last year in finish—taking the general run of cars on view—in style, and in convenience of equipment. Between the tonneau proper and the surrey-runabout pattern of mounting, there is, in manifold evidence, that bit of exquisite humor the toy tonneau. Enough, that its popularity cannot prove of more than a year or two's duration, since it is at once ungainly and inutile.

The closed type of body naturally continues to be prospered in all its varieties. Apparently, however, the light and appealing town car, whether in coupe or landaulette form just now is coming in for a greater amount of attention on the part of the makers than is the more costly and elaborate type of limousine. Besides, the present vogue of the taximeter cab in public service exerts an alluring influence over many makers, who though they may not list their vehicles for this commercial service, yet adapt them broadly and openly to its demands.

Examples of town car or cab body construction at the Palace which were noteworthy were found on the Pennsylvania, Atlas, Ford, Coates-Goshen and Oakland stands, while both the Overland and Marmon exhibits include examples of the closely related, inside driven coupe, the former rendered conspicuous by its spotless white finish, and the latter by its extreme luxuriousness. In this connection it is to be noted that the interior of the Marmon instead of being cumbered with the host of mechanical appurtenances which used to be thought necessary to the management of the motor vehicle, is astonishingly free from such contraptions. The interior differs from the inside of an outside driven cab only in having the steering column with the motor controlling levers mounted on the wheel, the brake and gear shifting levers, and the switch casing and starting coil of the new Bosch ignition system. No other accessories are included, and there are no parts which might soil or otherwise render uncomfortable the persons of the two passengers which are accommodated.

Examples of improved and refined body construction in the more familiar types were found in the big limousines on the stands of the Dayton Motor Car and Welch companies. As a matter of fact, this particular show was more replete with closed vehicles than that of last year, or for any previous year, though a very important contribution to the number was that furnished by the luxurious foreign constructions which were about evenly divided between that and the open type. Conspicuous among these were the demountable limousine mounted on the Benz chassis, which is a remarkably luxurious achievement, the glass wind shield being set in sections, that in front of the driver being adjustable, while that which protects the other half of the front seat is fixed; and the folding limousine on the Mercedes shown on the Dietrich stand, and which has an extension top resembling in general appearance that commonly used on the ordinary touring car, but framed and glazed after the fashion of the complete limousine.



EASTERN AISLE, MAIN HALL, SHOWING WHITE DECORATIVE EFFECTS

Of the more popular forms of open body, and of American construction, rather striking examples are those which were shown on the Welch and Austin stands, among others. The former exhibited the rather unusual though promising characteristic of a considerable overhang at the ends of the rear seat, whereby that portion of the body was widened not a little and its capacity proportionately increased. The width of the front seat was in no way abnormal, and the little rumble which was added in the rear to complete the close-coupled effect, was arranged to disappear on occasion into

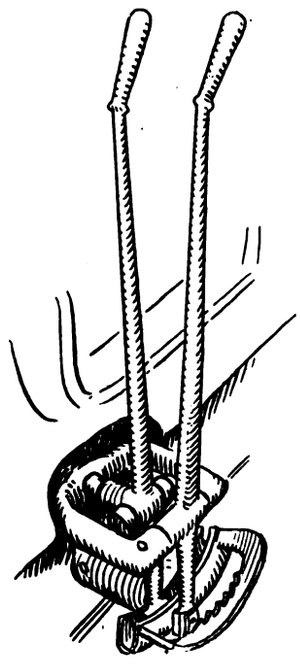
the surface of a short turtle deck. The Austin body referred to was of the ordinary in that the detachable rear section was arranged for either baby tonneau or rumble service—in either case revealing absolutely no hint of convertibility. The separation between the stationary and demountable parts being designed to include the outline of the rumble seat, this was made comparatively simple, as the only practical difference between the two lay in the use of the higher backed seat and doors in the tonneau formation. The Moon, Cartercar, Premier, Pennsylvania and Pullman body displays also afforded rather striking examples of careful delineation, while the effective lines of the Stoddard-Dayton cars, particularly in the case of the larger chassis equipped with the baby tonneau were such as to give the impression of a neat, unobtrusive structure and almost diminutive in the case of a machine which in reality is both powerful and fast.

CARS WHICH MAKE THEIR DEBUT.



Whatever of interest attaches to the show as a whole, or to the other individual exhibits, it is the case invariably that the majority of interest expressed among those who are familiar with shows hinges about the cars, which are new, both in the absolute sense, and as applied to vehicles never before shown locally. In this respect the show continues to hold something the attraction of a vast Pandora's box, the contents of which are a source of more or less mystery until the moment of unveiling. The number of new machines shown this year proved to be even greater than had been anticipated. And further, the list of such vehicles included several which mounted features worthy of considerable individual study because of their distinctiveness.

Thus in the case of the Inter-State, no small amount of interest developed as to the construction of the transmission mechanism. Instead of the older method of hanging the gearset on the main or subframe and driving through the propeller shaft, or of driving through the shaft direct from the clutch and mounting the gearset on the axle, a combination of the two principles—entirely new—has been developed, in which the gearbox is mounted directly on the torque tube but at its forward end, while the suspension of that member is carried forward to the cross frame member directly behind the engine. By this means many of the advantages of the rear axle mounting are obtained, among them that of the long reach of the shaft and tube, while the gears are relieved of the abrupt and uncushioned shock which they are forced to sustain when carried dead on the axle. In order to preserve the true floating relation of the transmission, the connection from the gear shifting lever to the gearset is made through a short shaft equipped with double universal joints, while both brake and clutch pedals are carried on the gear by itself, perfectly free of the frame. The car is driven by a quadruple, vertical motor of conventional design in many respects, but which has splash lubrication with a reserve oil supply carried in the base and

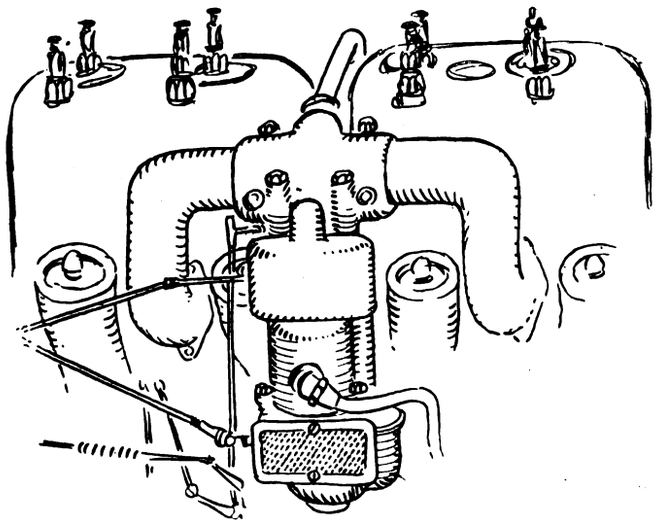
INTER-STATE TRANSMISSION

fed automatically to the crank case; and rather an unusual arangement of the intake piping, which is offset in order to clear the exhaust manifolds, since both inlet and exhaust are mounted on the right side of the assemblage. It also is noteworthy that the

OAKLAND SIDE LEVERS

steering connection is carried across from the right side of the frame to the left knuckle, thus permitting the steering gear to be mounted well forward in the frame.

In a number of respects one of the most remarkable cars to be seen for the first time at the Palace was the Oakland, one of the several significant products of A. P. Brush's pencil, which though twice shown during 1908, never before has been unveiled in a New York show. Two distinct models were shown, one of 20 and the other of 40 horsepower—the latter being an entirely new machine. The distinguishing characteristic of the lighter machine, is the method of counterbalancing the twin cylinder motor by means of a revolving weight, suspended on an independent shaft in a casing separate from the crank case, and so placed as to neutralize practically all vibration caused by the movement of the pistons. In this machine also is to be found an ingenious adaptation of the planetary principle, in the transmission gearing, which is of the shaft type, and suspended from the rear engine bearing, instead of from an independent cross frame member, as is more usually done with shaft arrangements. In the latest machines of this type, the foot brake is arranged to throw the clutch out of action, while as in the older models, the gear lever, which acts selectively, also is made to control the emergency brake.

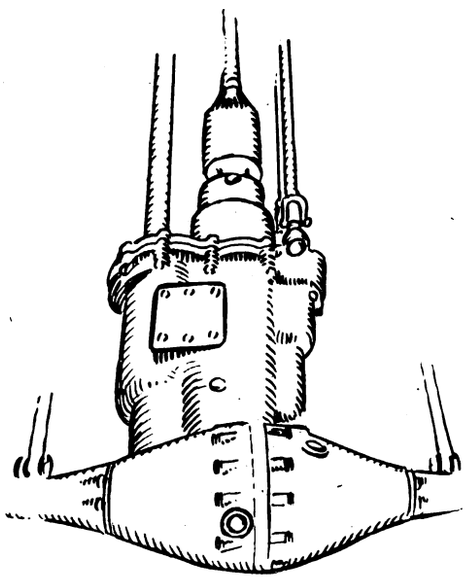


In the larger model, more conventional design is employed, save for the engine, which retains the peculiar cylinder formation employed in the lighter car, which embodies a liberal water jacketing area at the sides of the cylinders, but air-cooled heads. The motor is set upon an incline in order to secure a practically straight line drive under normal load conditions, and on this account a special arrangement of the lubricating system is required to prevent the oil from "banking" against the rear cylinders. This system is worked out with customary ingenuity. The transmission is of the selective, sliding gear type, controlled without the use of a segment, and the clutch is of the multiple disc type.

In the McCue-Hartford, was to be found another absolutely new vehicle, produced by one of the many old-line carriage makers who are so rapidly coming over to the ranks of the automobile builders, and who are bringing a vast store of useful traditions as to the methods best suited to the handling of the vehicle trade. The car is of conventional design, but is made extremely light for its power, which is rated at 30 horse, by the liberal use of high grade steels in the chassis construction, and of aluminum in the building of the body. In this connection it is noteworthy that not a single section of the body which could be built of the latter metal has been overlooked, hood and mounting, panels, fenders and wings included; so that the total weight of the roadster complete is but a trifle over 2,000 pounds. A four-cylinder motor, selective gearset, 36-inch tires and other standard features, presented in touring, runabout and roadster equipments complete the outline of this latest of Connecticut's contributions to the market.

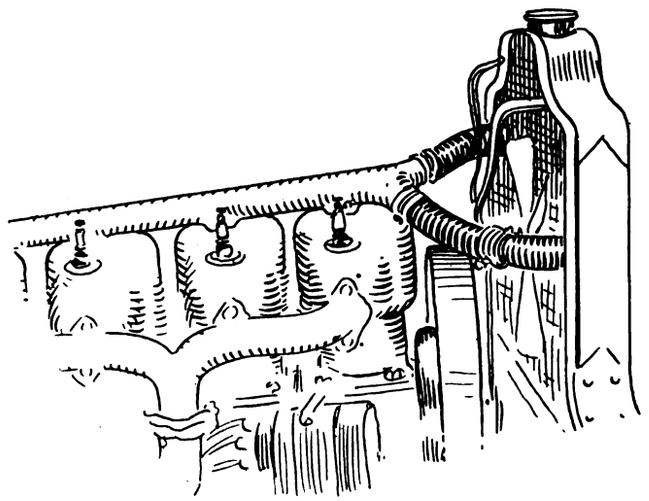
Another of the new cars displaying con-

Digitized by Google



siderable ingenuity—this time in the mounting of its rear axle-transmission unit—was the Regal. In this car the torsion, driving and shaft-housing functions are all carried out by the single torque tube, which is mounted at its forward end in a ball bearing seated on a cross frame member placed well forward in the chassis. The severe and manifold strains which are thrown on the construction at this point are resisted by the use of two Hyatt roller bearings, which are placed one on either side of the ball joint in the tube. The gear housing differs somewhat from ordinary axle-transmission construction in that the gearset is placed slightly forward of the differential casing, and is enclosed in an entirely separate compartment. The valves, carburetter and magneto of the four cylinder motor are located on the left side of the assemblage, this arrangement affording ample room for the mounting of the steering gear, which is carried well to the front, and mounted entirely above the chassis. The car, which is rated at 30 horsepower, is produced in two models which have roadster and touring equipments, respectively.

AMERICAN SIMPLEX, TWO-CYCLE MOTOR.

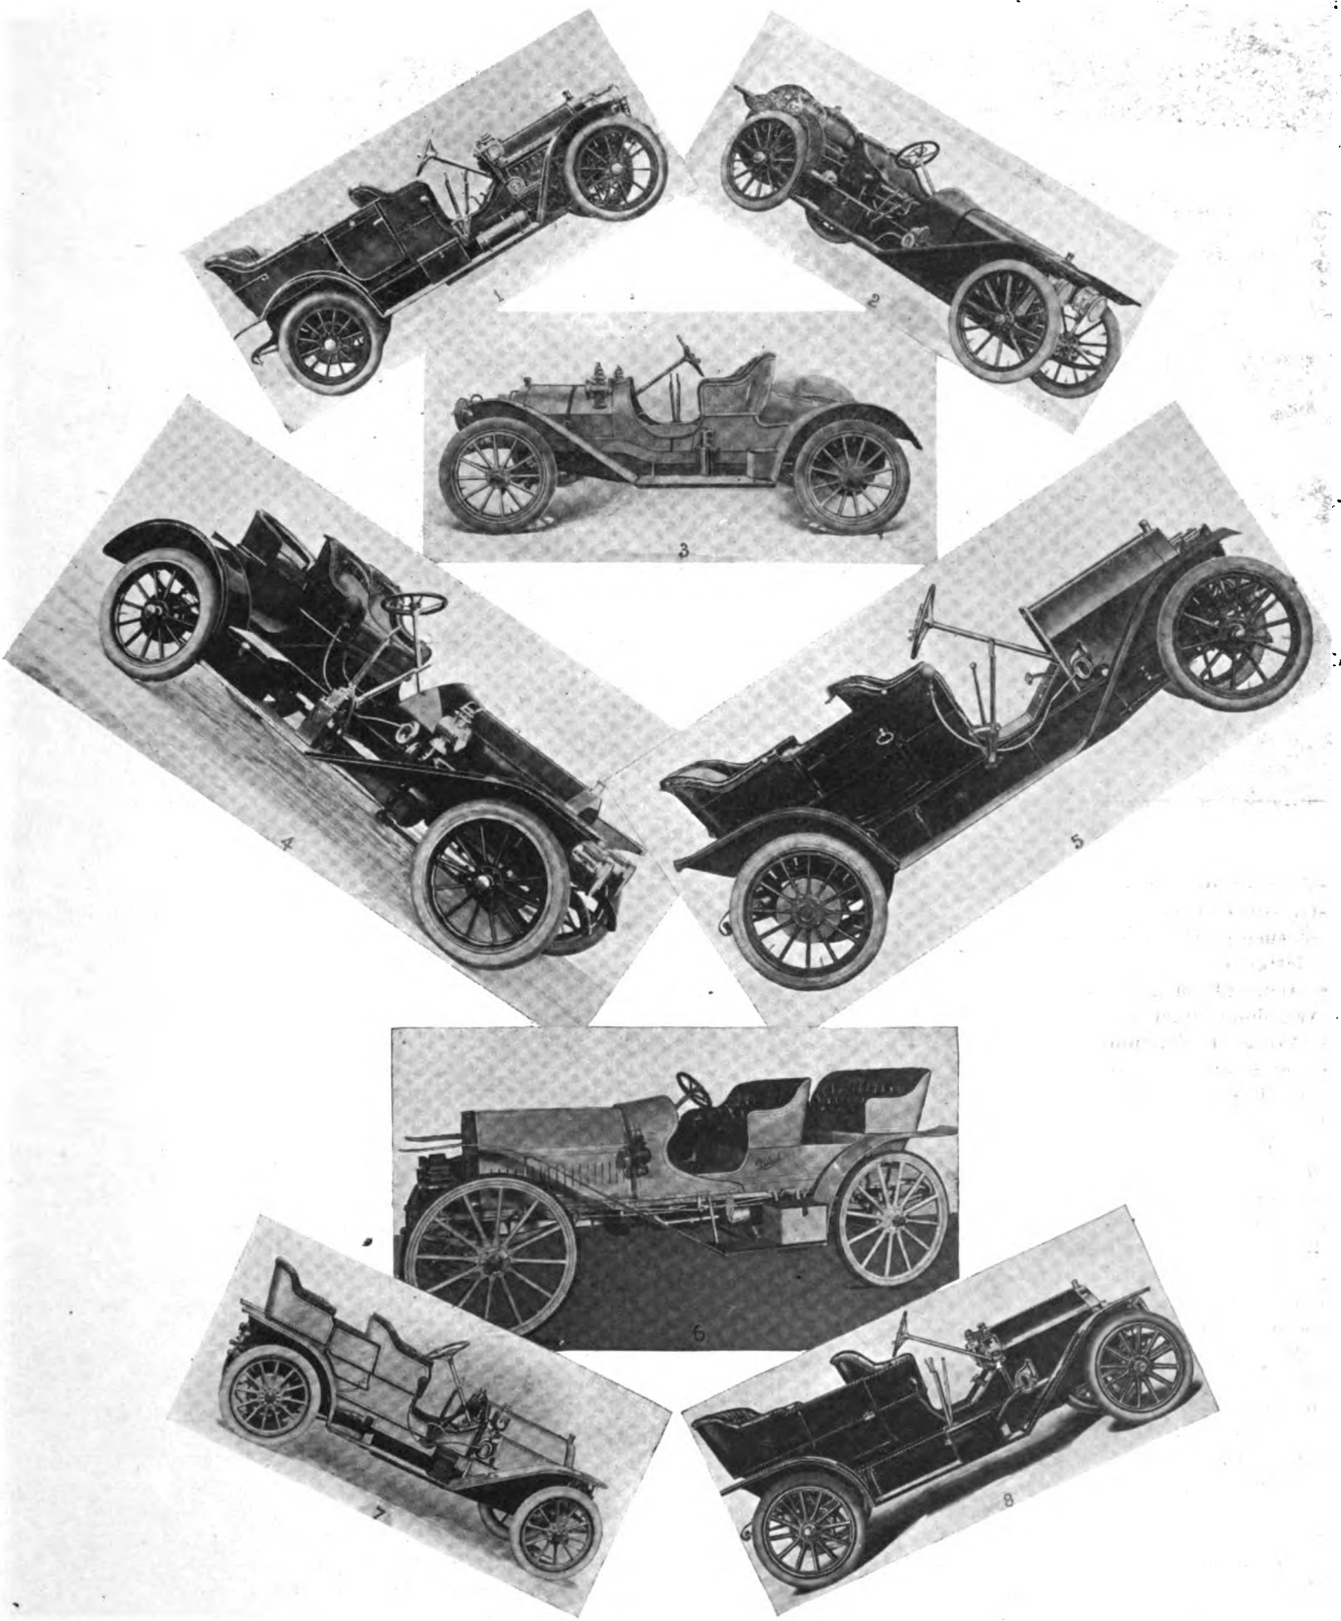


Already mentioned as possessing what is claimed to be the largest two-cycle motor ever installed in a motor car, the American Simplex, which, though several years old, never before has come to a New York show, possesses a number of other interesting features, as displayed in the single and latest model which was shown. As for the motor itself, it is described by its makers as being an ordinary adaptation of the three-port principle with no unusual or original devices to contribute to its success save in the way of perfected design worked out after long experimentation. The cylinders are cast in pairs, with jackets integral are of 5-inch "square" dimensions, and the motor has a rated output of 50 horsepower. Aside from this the machine is noteworthy because of the elaborateness of its mechanical construction—ball bearings being applied to all possible working parts outside the motor, for example—and for the massiveness and solidity of its design.

The transmission mechanism includes a five-plate clutch, with cork inserts, and an axle mounted transmission which is of unusually massive construction. The propeller shaft is equipped with two universals and a slip joint and the torque rod, which is carried well forward to a point directly beneath the footboard, is given a suspension which is absolutely universal. The driving action is taken by a pair of radius rods equipped with ball joints and also very long, thus giving the least possible amount of angular displacement as the chassis alters its relative position to the axle under the action of the springs. The selective gear shifting mechanism is so contrived that the selection is made directly inside the frame and close to the rocker shafts, while the gear shifting rods only extend to the gear housing on the axle. The car was mounted in roadster and touring forms, as shown at the stand.

AMERICAN SIMPLEX, REAR AXLE

The Speedwell, which though more than a year old, has not before appeared at the Palace, has undergone a few minor alterations since its initial appearance, notably in a lengthening of the wheel base and in the adoption of roller bearings for the telescoping journal at the forward end of the transmission shaft. This latter point, which is none too well protected in many gear boxes, is here given a thorough treatment, both thrusts and radial loads being well taken care of. The car, which is mounted on Timken roller bearings almost without exception, has a 40-45 horsepower, four-cylinder, vertical motor, and carries its gear box in the familiar location in the waist of the chassis, where it is mounted on a sub-frame extended back from the front of the vehicle. The master clutch is of the cone type, and many of the structural features are of purely standard type. In the construction of the motor, however, is to be found a commendable feature in the way in which the auxilliary drive is taken care of. The oil pump—which feeds the crank case from a sub base of liberal volume—the magneto and the timer are driven from a vertical shaft located in front and on the right side of the machine, the group being assembled in a stable service pillar of aluminum which supplies a complete housing for the drives, and for the hardened worm driving gears. The car is built in a number of different styles of body mounting, but at the Palace appeared in roadster form together with a stripped chassis for demonstrating purposes.



DETAIL OF MAXWELL PIPING

Considerable stir was created at the recent Garden City Sweepstakes on Long Island, when a proverbial "dark horse" in the Sharp Arrow fulfilled the mission which its name implied and carried off the honors in the event. The machine was absolutely unknown before, and now appears in public for the second time, the presence of a stripped chassis at the Palace affording opportunity for the alleviation of the considerable amount of curiosity which had been

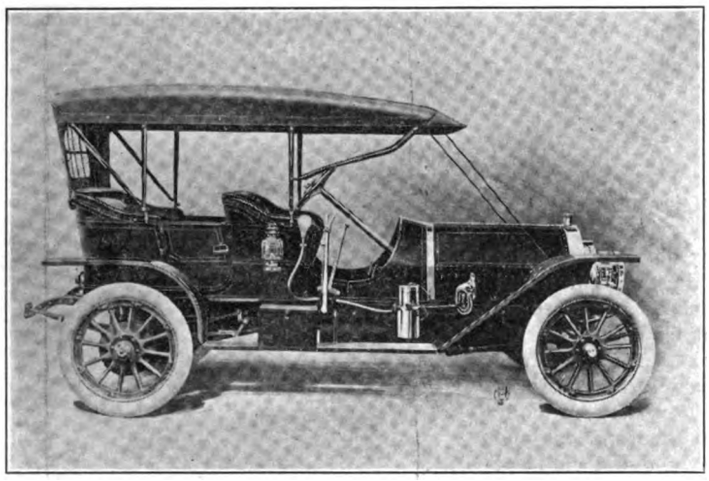
McINTYRE EXHIBIT, SHOWING NEW THREE PASSENGER HIGH WHEEL ROADSTER

expressed as to its construction. In this, it appears, considerable stress is laid upon the use of such of the newer metals as permit the designer to secure great strength with the saving of considerable weight. The use of vanadium steel in the springs effected a saving of 50 pounds, it is claimed, and the same process carried out pretty much through the entire machine resulted in the development of a car which is unusually light for its rated output of 40 horsepower. In general it is of conventional design, but evidence is not lacking of careful attention in the development of numerous small details. A typical instance of this is to be found in the arrangement of the torque rod suspension, which, as the traction drive is maintained through the front ends of the rear springs is free to move forward and back in the chassis. To allow for possible displacements of the axle from its proper transverse plane, however, the end of the torque rod is slipped into a bronze ball, which, in turn, is free to slide or roll in a hanger which is spring supported from the frame.

In the Coates-Goshen, is to be found a car which the gospel of the ball and socket joint is carried out to the last extreme, practically every articulation in the entire chassis being equipped with this form of connection, worked out after the general plan which is almost universally adopted in the arrangement of steering connections. In addition to this an original torque provision is found in the shape of a torsion resisting member which is affixed to the differential housing in the usual way, but instead of being carried forward to an independent support on the frame, is forked at its forward end, and affixed to a yoke and collar surrounding the propeller shaft just behind its point of suspension from the cross frame member. This machine also is provided with a rigid and positive interlocker to safeguard the gears from misuse and also with a contrivance for throttling the carbureter automatically whenever the clutch is withdrawn from engagement. Another original characteristic is found in the arrangement of the gear shifting mechanism which embodies the now familiar principle of the two short rocker arms which are selectively engaged by the hand lever. This mechanism being rather obtrusive at one point, it has been necessary to form an elongated yoke in the lower part of the emergency brake lever in order to clear the selective device—this arrangement furnishing a ready means of identifying the car. The "double drop" frame employed affords means of providing a low-hung body without sacrificing clearance, and the car is put out in runabout, touring and cab forms, on the same style of chassis, though in two sizes, namely 25 and 32 horsepower. The runabout and cab styles were shown on the stand.

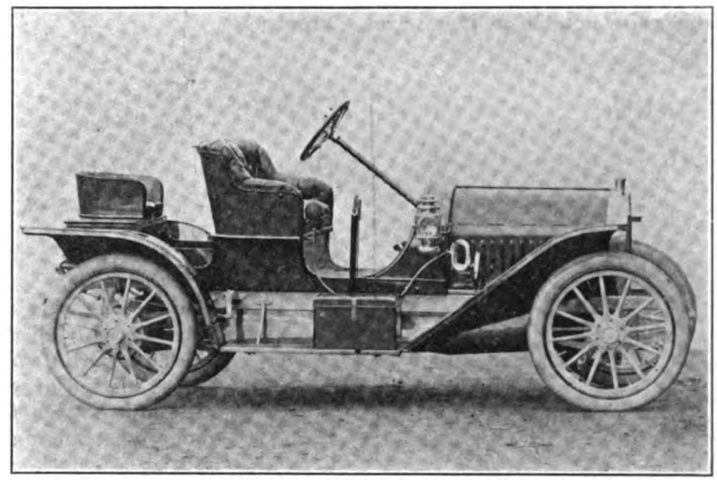
A distinguishing feature of the Midland is the use of finger pawls on the gear shifting and emergency brake levers placed so far down on the levers that to reach them must require a conscious effort on the part of the driver. This is done with design, and with the direct intent of making mistakes in the handling of these same pawls, which release the reverse and brakes, respectively, practically impossible. In the mounting of the gear levers, it should be observed, some little ingenuity is displayed, particularly as to the manner in which selection is made possible without the use of the gate or gridiron segment. The hand lever, which is pivoted universally at its lower end, is adapted to engage either one of two forked levers when moved either in or out. In doing so, it depresses the upper end of a short lever carried by the rocker arm and itself pivoted at about its middle point, its lower end forcing over a small pin, which causes another lever, carried by the second arm to be forced oppositely to it, thus entering the stationary single segment and so locking the idle gearset in position. Aside from this feature, the car is mainly of conventional design: 30-35 horsepower motor, cork-insert-plate clutch, sliding gearset and shaft drive. At the Palace it was shown in the touring form, which is known as Model "G-9".

The Middleby is one of the "great-deal-for-the-money" cars. Aside from its air-



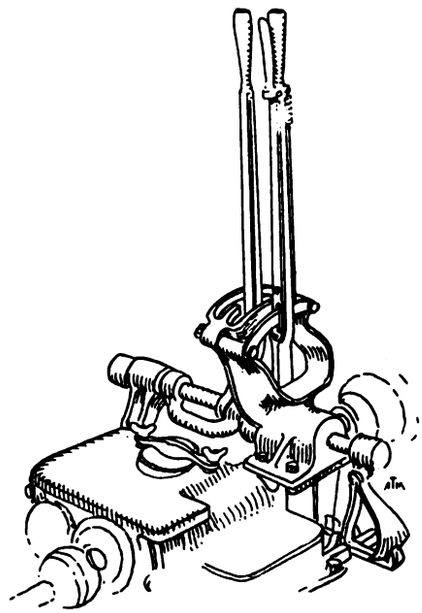
Digitized by Google

cooled motor, which, by the way, is hung in the frame by means of transverse angle steel members instead of the more common arms cast integral with the crank case, it possesses little out of the common run in everyday construction. At the same time, it is equipped very fully, the regular allotment of accessories included magneto ignition with battery equipment as a standby, and a special convertible body of original design, which may be used either as a surrey or runabout by virtue of its folding and disappearing rear seat. The motor, which is rated at 25 horsepower, is equipped with main and auxiliary exhausts, the former being guarded by mechanically actuated valves. The same vehicle with a few reductions in equipment and a simpler runabout body, is put out at the remarkably low price of $850.



Among the newcomers, not hitherto mentioned, was the Benner Six—a light, racy type of vehicle, exhibited in chassis and grey racing body, rated at 25-30 horsepower and generally built to cater to the wants of the patron of speed who desires to limit his cash outlay to such an amount as may secure for him a vehicle of moderate size but considerable speeding capability. Aside from its peculiar racing characteristics, the machine presented few features not already canvassed in connection with the characteristics of the more familiar types of car.

That corner of the first gallery which was devoted to the display of the Browniekar was rendered conspicuous by the fact that one of the diminutive vehicles was there mounted on a trestle some five or six feet in height in order to enable the visitor the better to inspect its under mechanism. The subterfuge also served to attract the attention of passing visitors who otherwise might not have been keen enough of vision to see the exhibit at all, so small were the vehicles by comparison with the commercial vehicles staged nearby. The toy car, which it is in all truth, despite its practical construction, is equipped with a single-cylinder, vertical, water-cooled motor, and transmission by the primitive single flat belt to a countershaft, from which the rear wheels are driven through individual V-belts. Varying speeds are obtained by altering the pressure applied to one of the two foot pedals, while the simple mechanism of control is completed by a second brake pedal and the usual spark and throttle levers mounted on the steering wheel.



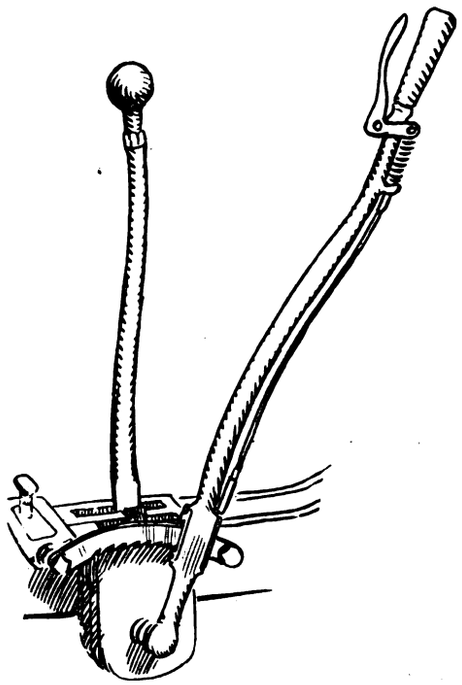
Taximeter, otherwise public service cab operation, has given rise to a number of vehicles built for just this purpose, and displaying characteristics especially suited for work of the sort. Of the two such vehicles shown at the Palace, the Rockwell, which is entirely new, exhibited several noteworthy features, among them the use of but two sizes of nuts and studs in the entire assemblage of the power plant, and the ingenious maner in which the transmission mechanism or the block type motor could be dismounted within a very brief space of time. In the former instance, the only tool required is a socket wrench—the gear case sliding out of engagement with the propeller shaft with its self-suspended torsion tube as soon as the four holding studs are relieved. In the second case, the use of spanners to disconnect the water connections also are necessary. Both of the two units come away from the remainder of the chassis complete and with their appurtenances integral and both are capable of ready repair or replacement on short notice. The cab in question is further distinguished by the use of left side control of the vehicle, with levers centrally placed and mounted hard and fast on the top of the gear case. The body construction also is distinguished by the use of a half front seat, the remaining space on the foot board being designed for the transportation of luggage. The motor is rated at 18-20 horsepower, ignition is by magneto with fixed spark, and the chassis is equipped with a neat five-pasenger extension landaulet body.

SPEEDWELL TOY TONNEAU

REGAL ROADSTER

ROCKWELL GEARSET

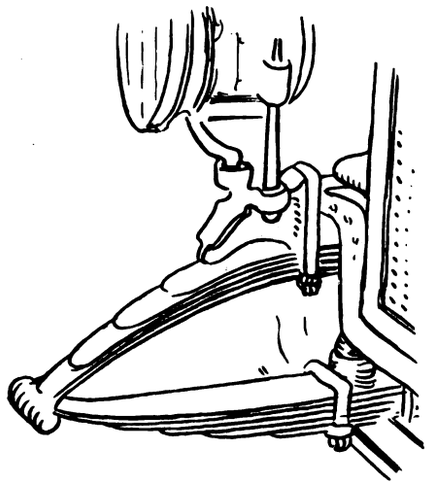
A second newly built cab, of somewhat similar construction in several respects, is the Ewing, which is equipped with a 20 horsepower motor, with 3⅞ by 4 inch cylinders, selective gearset mounted with levers in the centre of the footboard, shaft drive and generally standard construction. By means of an automatic pump arrangement, which ensures constant circulation of the lubricant between the sub-base and the crank case, lubrication is rendered entirely automatic, and as no sight-feeds or adjustments are provided, that feature requires absolutely no attention from the operator. The vehicle is provided with a neatly designed landaulet body seating five passengers inside. Structurally, it reveals no departures from standard practice in other lines, and appears as well suited to the requirements of the private town-car user as to the needs of the taximeter patron.



Still another vehicle answering to the same general description in the matter of intended service is the Sultan. This machine is practically an American assemblage of a foreign car, since motor, change gear and other chassis parts are imported entire, while the wheels, body work and accessories are assembled in this country.

Digitized by Google

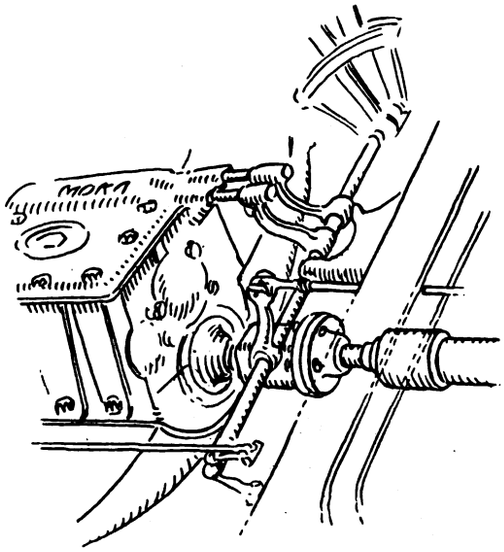
It is controlled from the right side, is of generally standard construction, and is driven by a 12 horsepower motor having four paired cylinders of 3 by 4⅜ inches dimensions, thermo-syphon cooling, magneto ignition, progressive gear change and shaft drive. It also is produced with town car, landaulet body, with or without extension top. As shown at the Palace, only the plain straight-front landaulet body was in evidence.



NEW MODELS OF OLD CARS.

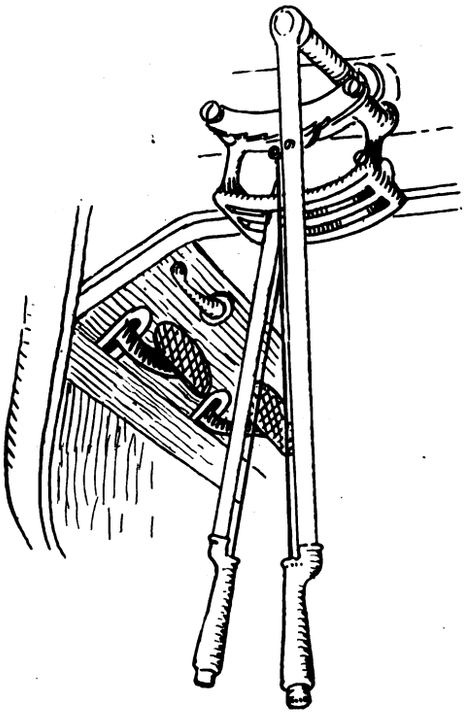
Among the cars which represent the product of several years progress among the makers, numerous examples were to be found of new models which either constituted rather striking alterations over those which had preceeded them, or which were otherwise notable in themselves. Properly

STODDARD-DAYTON SIDE LEVERS



belonging in the latter class was the display of the new Model "N" Ford cars. Despite the considerable prominence which these vehicles already have achieved, they still attracted a deal of attention both because of the remarkable amount of car offered at the prices ranging from $850 to $900 for the various body mountings, and also because of the clever method in which they are constructed. In particular the manner of incorporating the magneto in the engine fly wheel and without the employment of rotating conductors of any sort should be mentioned, while the unit power plant design, including the use of the block type of cylinder casting except for the cylinder heads also is noteworthy. The heads in this case, contrary to the usual practice in the design of block motors, are closed with a single, water-jacketed member, the ready removal of which permits complete access to the cylinders and pistons for purposes of repair or cleaning. Another departure exists in the manner of suspending the chassis. Two semi-elliptical end springs are used, which are bolted hard and fast to the chassis at front and rear while the ends are shackled to the axle ends. In the case of the rear members, additional clearance for

JACKSON LAMP BRACKET



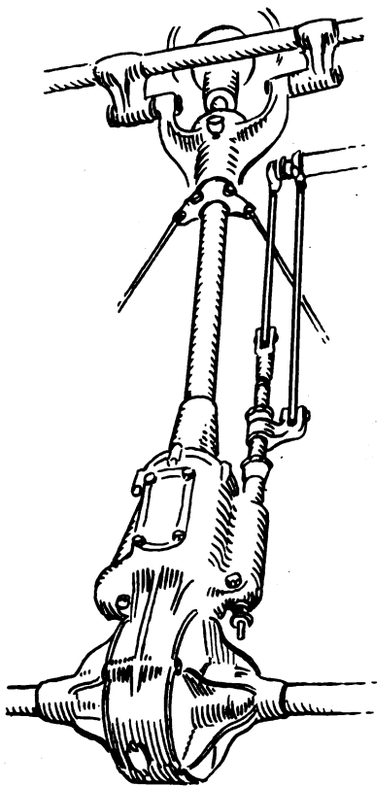
the differential housing is obtained by arching the spring upward in the center and also by elevating the shackle points somewhat by applying the connections to the insides of the integral covers for the brake drums instead of to the axle proper. Fords are now obtainable in a variety of body mountings ranging from the runabout and touring car to the town car and cab, not omitting a very neat adaptation of the principle of the inside driven coupe.

In the Stoddard-Dayton line, this unique bit of enterprise is manifest, that all of the

MORA TRANSMISSION

three chassis styles produced are of precisely the same design. That is to say, though the motor sizes, wheel bases and other dimensions are increased in proportion as the power of the cars increases for each of the models, the structural features, materials and arrangement, even to the body design remains practically unchanged. By way of variation, a very great number of different body designs are presented so that the line from which the purchaser may select is unusually extensive. For this year, comparatively few alterations have been made over the practice in vogue a year ago. The construction of the motor has been altered to the extent of abandoning the copper water jackets which used to be employed, and the substitution of the integral construction with large pressed steel end plates to complete the enclosure of the twin cylinder units. The overhead valve construction is retained as is the general arrangement of the valve gear. At the same time, a new system of constant flow lubrication has been installed which gives an endless supply of oil under pressure to all the bearings, actuated by a cam operated

MITCHELL SIDE LEVERS



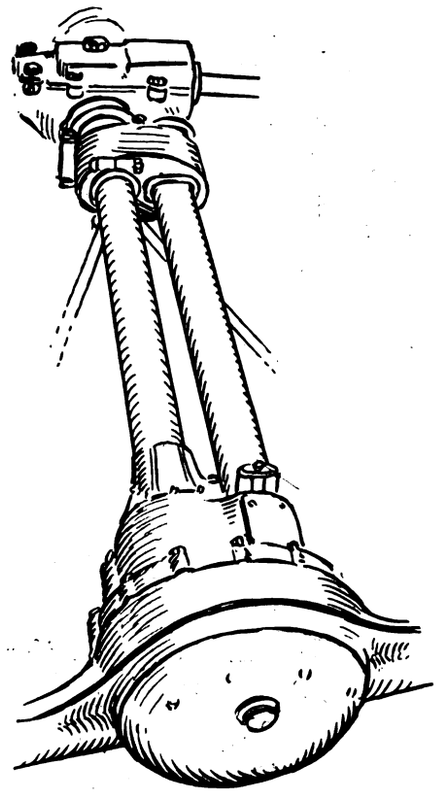
pump, driven from the cam shaft; and one or two other minor changes have been made. As for the chassis construction, some slight alteration has been brought about in wheel bases, tire sizes and the like, while on one or two models the foot accelerator has been adopted. In all models the position of the gear shifting mechanism has been altered so that now the gear lever comes outside the frame line instead of within it as before.

With probably a majority of the cars staged at the Palace there were presented practical reconstructions of previous models with only the usual number of annual refinements which the more stable makers find it expedient to introduce at the beginning of the year. Among these was the Mitchell line, in which a change has been made from the progressive to the selective method of gear shift, magneto ignition introduced reg-

Digitized by Google

ularly on the 30 and 40 horsepower models, and on the latter a platform rear spring suspension. This model also is distinguished by a rather unusual type of foot accelerator which instead of following the usual pedal design, is arranged to swing in a circular arc parallel to the inclined toe board and so placed that the foot may control it without being tilted above the floor. In consequence the ankle strain arising from long periods of continuous driving is alleviated.

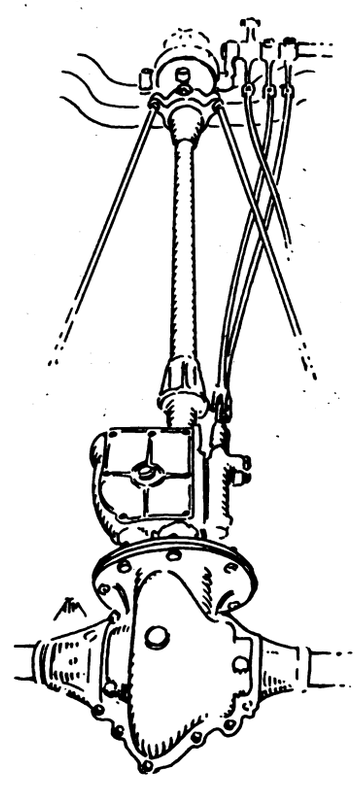
Full elliptic springs applied to the entire line, are a feature of the latest Jackson models, and of course, were given considerable prominence in connection with demonstrations of the new Model "H." This is



MARION TRANSMISSION

a clean lined little 30 horsepower car, equipped with quadruple motor having valves on the left, magneto ignition, and selective gearset arranged with the lay shaft over the main or driving line. By this means the desideratum of compact design has been secured, while the position of the gear box well forward in the chassis is such as to give it complete accessibility.

In the new light Mora rather unusual construction was found in the method of assembling the torsion and driving group. Instead of mounting the torque tube which encloses the propeller shaft in an independent spherical bearing, supported directly by the frame, as is more frequently done, the member is given a long bearing on the shaft itself, while the entire stress of the driving action in the shaft and the torsion of the axle group is thrown upon the rear bearing of the gear box—itself mounted on a suspension member attached to the frame. Otherwise the car is of light, well-designed and thoroughly practical construction.

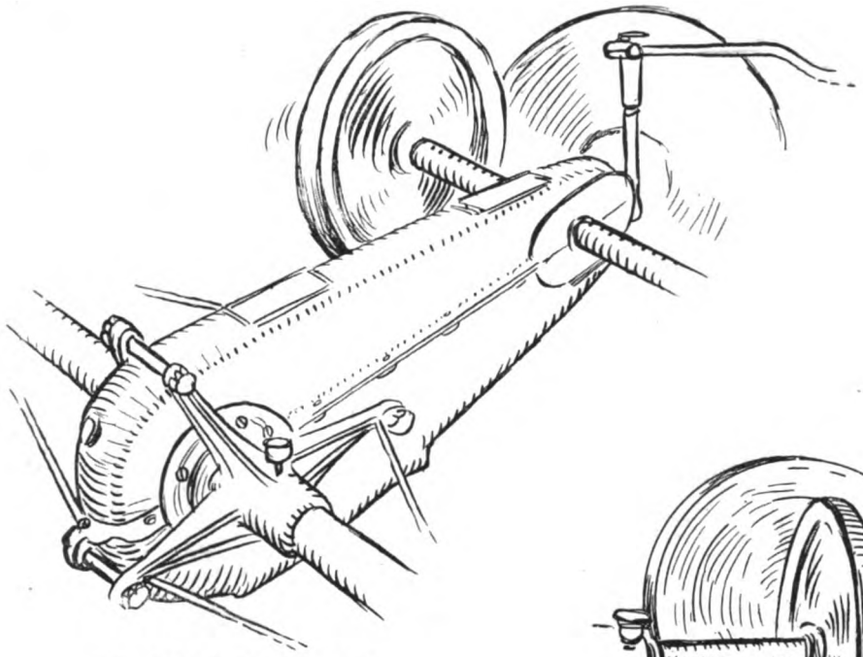


The use of 40 inch wheels on the Traveler model of the American car already has been referred to. This vehicle also retains in its integrity the underslung suspension which has remained an exclusive feature with its makers for several years, but introduces this year for the first time the adaptation

MARMON TRANSMISSION

of it to the four passenger vehicle. On the newer models engine dimensions have been increased from 5¼ by 5½ to 5⅜ by 5½ inches. The Wayfarer, Gadabout and Limousine models in addition to the Traveler are new this year. The first of the three in question is a very compact and low hung adaptation of the close coupled principle, though employing the usual method of frame suspension; the second is an embodiment of the baby tonneau idea, built with ample foot room between the front and rear seats; and the third is a more conventional vehicle of neat and attractive lines. The Tourist, Roadster and Speedster models are retained, with sundry minor changes. Three of the roadster models and one of the touring car were on view at the show.

In the new model Marmon, otherwise known as the "Thirty-two," is to be found an unusually neat rear axle assemblage which also embodies the change gear group. The axle housing is composed entirely of pressed steel, constructed with stiffening webs above and below and closed at the back with a light cover plate, also a stamping. The torque resisting medium is in the form of a tubular housing for the propeller shaft, while along side it is a second housing which encloses the pull-out rods which actuate the sliding sets in the change gear mechanism. The latter is so contrived that the [illegible] through the removable cover plates without disturbing the axle in the chassis, while at the same time, when in service every moving element in the transmission is completely enclosed against the inroads of dust and dirt. The motor is water cooled, neatly drawn and well mounted in the frame. A second and larger model, possessing many of the same features as the other, but having the change gear mounted in the waist of the frame in the more conventional manner is rated at 50 horsepower.

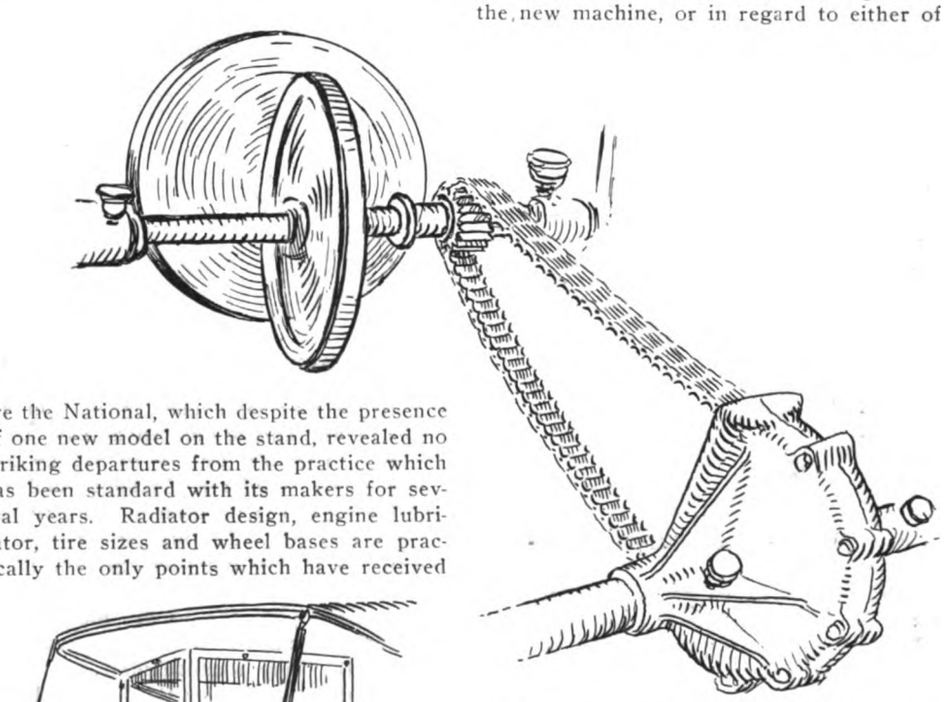


REGAL TRANSMISSION

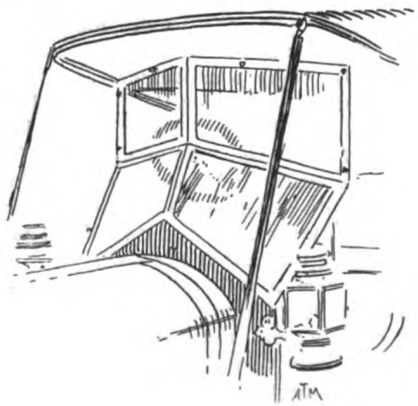
The Marion cars, which also are numbered among those mounting the change speed gear on the rear axle, are equipped with a selectively actuated mechanism this year instead of the progressive type formerly employed. Another new feature is the adoption of magneto ignition with dry cells as a standby in place of the old accumulator equipment. The show display consisted of one of the 32-35 horsepower chassis and a top tonneau touring car. Adjacent to this booth was that of the Overland Automobile Co., at which were shown several of the newer models of that name, bearing the selective change gear—like the former mounted on the rear axle—but operated by side levers instead of by pedals alone, as was the case with the planetary change gear which figured on last year's model. This arrangement is still retained as an option, and appears likely to continue in use as the convenience of the leverless control, especially where women drivers are

Digitized by Google

concerned, is of unquestionable advantage. Touring, roadster and the inside-driven coupe model already mentionel, figured in the display.



Maxwell has become a name for the seekers of the low-priced car to conjure with since the recent introduction of the little runabout known appropriately as the "Maxwell Junior." In general details, this little machine which has not graced a show before, follows the details of the two-cylinder opposed type which already has been so successfully exploited by its makers in cars of larger power and price. The opposed motor, planetary change gear and shaft drive to live rear axle employed on the larger machines are here faithfully reproduced. To complete the line, there are the 14 and 20 horsepower opposed models, continued over from last year, and the 30 horsepower quadruple engined car, which is built both in touring and roadster models.



CARTERCAR CHAIN CASE

One of the two friction driven cars of conventional mould to be shown was the Cartercar, which was displayed in two models, the smaller of which was the new offering priced at $1,000 and making a most creditable showing at that figure. Mechanically, its most striking feature outside the use of the friction change gear, which is retained without change, is the use of a complete, grease and dust-tight enclosure for the chain which drives from the countershaft to the rear axle. This is put up in a neat and workmanlike manner and as shown in chassis form on the working model, served to attract considerable attention. The second machine of the group in question, was the Lambert, the smallest model of which now boasts a somewhat striking innovation in the shape of a silent chain belt connection between the countershaft and the rear axle. This machine also was shown with its transmission in running order and driven by an electric motor it formed one of the rare and welcome moving exhibits of the show. The transmission feature comprises merely the use of the chain applied to a pair of spur gears and eliminates the noise as well as one or two other of the disagreeable features usually supposed to accompany the use of the sprocket chain drive.

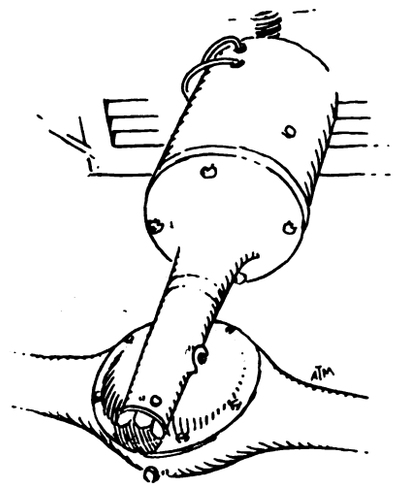
Other cars which fall into this category are the National, which despite the presence of one new model on the stand, revealed no striking departures from the practice which has been standard with its makers for several years. Radiator design, engine lubricator, tire sizes and wheel bases are practically the only points which have received extra attention in the production of the models of 1909. In the case of the Atlas, otherwise distinguished by the use of its original two-cycle motor, changes have been made affecting principally the transmission, and the arrangement of the engine auxiliaries. In the former instance, the planetary gear formerly employed has now been done away with to a very large extent and a selective sliding gear has replaced it. The thermo-syphon cooling system also has been displaced by a pump system. The engines still are produced in two and three cylinder units.

LAMBERT CHAIN-BELT TRANSMISSION

GAETH WIND SHIELD

The same principle of relatively few changes with occasionally the addition of a new model cast along the lines already wrought out, but differing from its fellows largely in matters of power and body equipment apply equally well to such cars as the Acme, Premier, Pullman, Moon, Gyroscope, Kissel, Pennsylvania and Reo. The Premier has a new method of demounting the clutch this year, the Moon a new system of twirling the magneto shaft in order to obtain an impulse when it is desired to start "on compression"; the Pennsylvania was shown for the first time in six-cylinder form, but otherwise practically without alteration in design either in general with regard to the new machine, or in regard to either of the two four-cylinder models; the Reo in addition to a newly designed front axle is now so arranged that the radiator may be filled without lifting the front hood.

The little Brush runabouts now are equipped with a new planetary change gear system embodying a multiple disc clutch, and also with a new type of carburetter. Otherwise they remain practically unaltered. The Gaeth in addition to a few minor changes in the construction of the chassis, was shown mounting a brand new type of wind shield of original design, which was arranged in four converging planes meeting



Digitized by Google

in the center and a little above the dash. Both upper and lower sections were thus contrived to deflect the air currents, and while the upper one was placed at only a very slight angle to the vertical, the lower was inclined to the rear sufficiently to bring the upper section of the shield close to the faces of the occupants of the front seat. Folding and sash replacement features also were pointed out among its advantages. The "Perfected" Great Chadwick, still retains its peculiar copper water jacket formation enclosing the twin cylinder engine groups, and its air of immensity in the mechanical sense. The gear control has been rearranged and a few other minor alterations made. The Allen-Kingston, formerly made for the selling company of that name at a factory in Kingston, N. Y., now is built by the Bristol Engineering Co., and in redesigned form appeared as a rather close copy of foreign car practice, and impressively heavy in construction.

MOTOR BUGGY DEVELOPMENTS.

Activities in the promotion of the motor buggy idea have resulted among other things in the production this year of an entirely new development in that connection. As revealed at the stand of the Black Mfg. Co., it took the form of a four-cylinder, 40 horsepower machine, patterned in respect to general body outline, after prevailing touring car practice, but lightened in keeping with the formation of the average high-wheeled carriage type of vehicle, and standing on 40 inch wheels, shod with solid tires. The same firm also produces a variety of other types, which with the vast number of options and combinations of options which only carriage makers of experience know how to offer results in a line of 22 different models—all mounted on high wheels and answering to the definition of the motor buggy. One of these is a particularly neat adaptation of the surrey idea, which also is seen in practical counterpart on the stand of th W. H. McIntyre Co. The latter concern, formerly known as the W. H. Kiblinger Co., has undergone a change of name during the past summer, but practically without change of status, the interests which have controlled the business for many years now having entirely displaced those from which the company took its name when first established in the production of horse-drawn vehicles. The McIntyre Co., in addition to staging several types of runabout and roadster, in addition to the surrey mentioned, also announce the expected production of larger types in the not distant future, to be driven by four and even six-cylinder motors, but otherwise to be of the true high-wheeled variety.

Among the more familiar names in this connection, that of the Holsman—the pioneer vehicle in its class—was distinguished by the presence of a new "Gentleman's Automobile," in which a form of closed coupe body, with central controlling pillar adapted to be operated from either end of the seat was combined with a somewhat modified form of the direct transmission so long employed on this machine, using a chain belt of exclusive form. The most striking feature of the structure, however, proved to be the new motor, which is suspended on the transmission countershaft, and is of the four-cylinder, air-cooled, opposed variety. Instead of the usual crank and connecting rod assemblage, the opposed pistons are connected by an integrally cast web, which embraces a large annular ball bearing, so mounted as to have transverse play in its housing, but none longitudinally of the motor. As a result the movement secured is practically that of the old-fashioned Scotch yoke, but without the drawback of excessive friction which that mechanism possesses. The valves are automatic on the

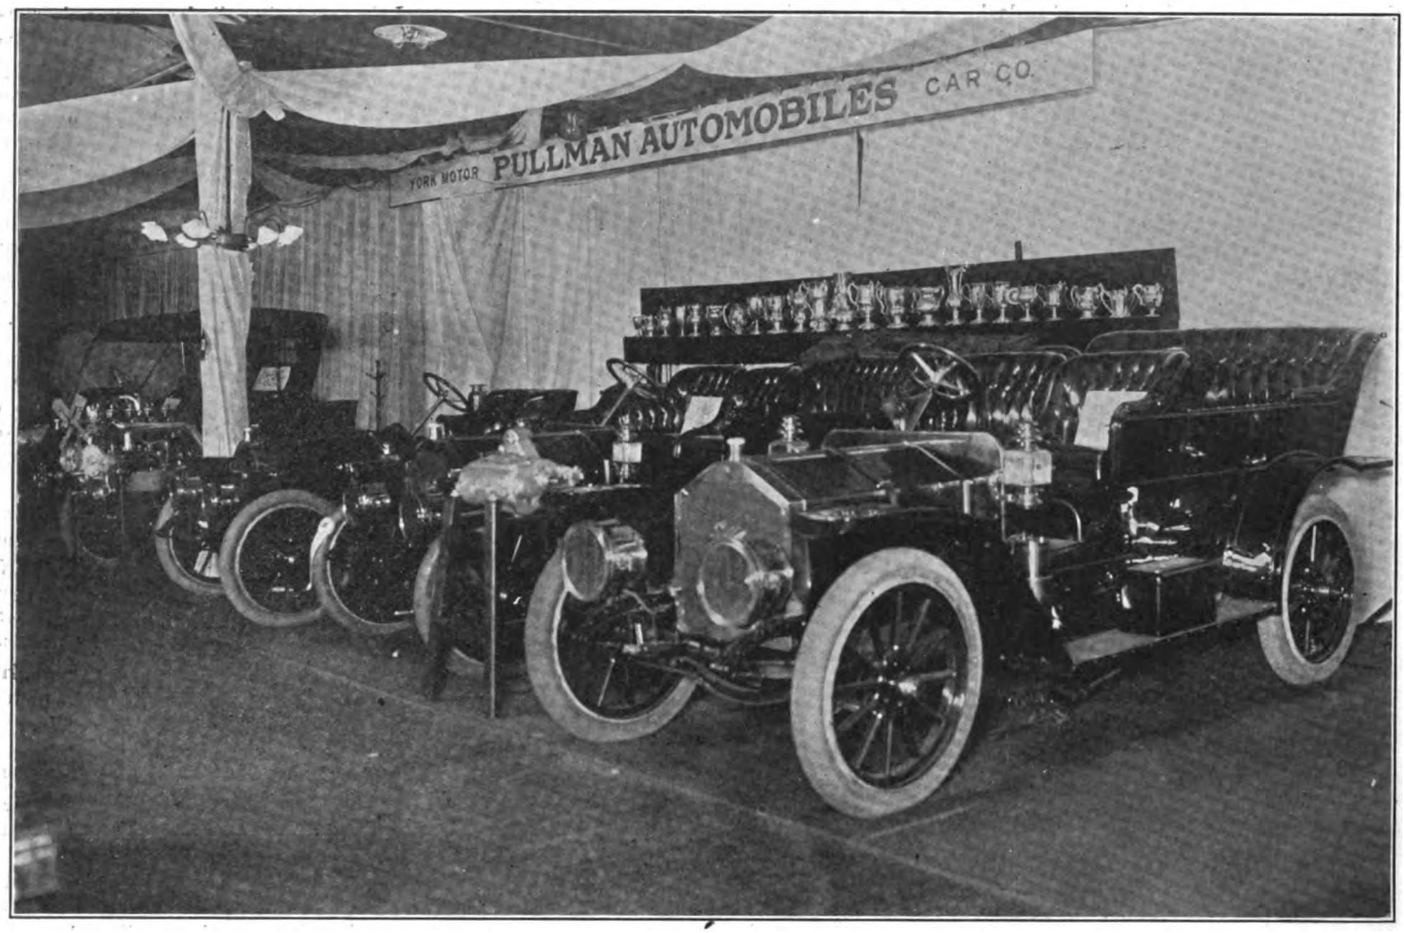
COMMERCIAL TRUCK WORM DRIVE

intake side, and operated directly from the eccentric shaft which replaces the crank shaft, on the exhaust side, and the arrangement is unusually compact and light for the output of 26 horsepower claimed. Altogether it was the most radical departure in the engine line, revealed at the show.

Such of the other well-known names among this class of builders as were represented, presented but slight alterations in practice over last year. The Reliable-Dayton, which is a particularly solidly built vehicle revealing many of the engine and transmission characteristics of the low-wheeled cars, the Schacht, with its original form of friction drive, and the Anderson, with its combination of the buggy form of reach running gear with the chassis of the power plant hung on full elliptical end springs which also support the body, were among those in evidence.

NOVEL FEATURES OF COMMERCIAL TYPES.

Commercial vehicle interests at the show this year received no small impetus by the presence of three vehicles never before exhibited. In the Grabowsky, interest centers in the method of demounting the power plant complete. The driving mechanism comprises a twin-cylinder, opposed, water-cooled motor and planetary change gear, driving through a propeller shaft to the rear of the chassis, from which the rear wheels are actuated through a counter shaft and side chains. A sub-frame carries the plant, and is formed as a sort of slide upon which the plant rests and is secured by a simple fastening device. By disconnecting water and ignition leads and the muffler pipe, and swinging out the front cross member of the frame, it is possible to draw the plant out of the chassis in its integrity, when it rests upon a folding stand which is a part of the contrivance. The driver's seat is mounted above the power unit and the remainder of the chassis is thus left perfectly clear for the sort of body adaptation best suited to the needs of the purchaser.



In the case of the Gramm-Logan, considerable originality is claimed for the adaptation of a sand box for securing traction for the driving wheels. This, it is said, never has been done hitherto in connection with motor vehicle construction. By depressing the proper lever, the driver is enabled to throw any desired amount of dry sand directly into the path of the rear wheels, as is commonly done for a similar purpose in railroad practice. The motors of this line are vertical and built with four cylinders, and the sliding gear transmission is connected through a multiple disc clutch of original design, and so thoroughly believed in by its makers that the practice of starting on the high gear is consistently recommended.

The third of the newcomers in this section is the Hart-Kraft—a 1,000 pound delivery wagon in which the demountable power plant feature also is played upon strongly. By disconnecting the plant from the frame of the vehicle at the three main points of support and uncoupling the ignition, water and exhaust leads, it is possible to remove the entire assemblage intact in a relatively brief space of time. This machine is further distinguished by being equipped with 36-inch wheels shod with 2½-inch solid tires—a size said to be produced especially for its makers.

As in former years, the Rapid line produced the most impressive display, with its wide variation of body adaptation applicable to the simple chassis construction employed as a standard feature. The double-opposed motor which has been a feature of this line for several years, and still is employed in the 20 to 30 horsepower units, now is supplemented by a 60 horsepower, vertical construction, which is calculated to extend the capacities of the line to cover practically all the demands of the commercial field. At the same booth, the light chemical truck equipped by the Tea Tray Co., called attention to the possibilities of the motor vehicle in connection with fire patrol systems.

Mack Bros.' Motor Car Co., the Reliance Motor Truck Co., and the American Motor Truck Co., each contributed their share of

Digitized by Google

PULLMAN EXHIBIT, SHOWING ARRAY OF TROPHIES

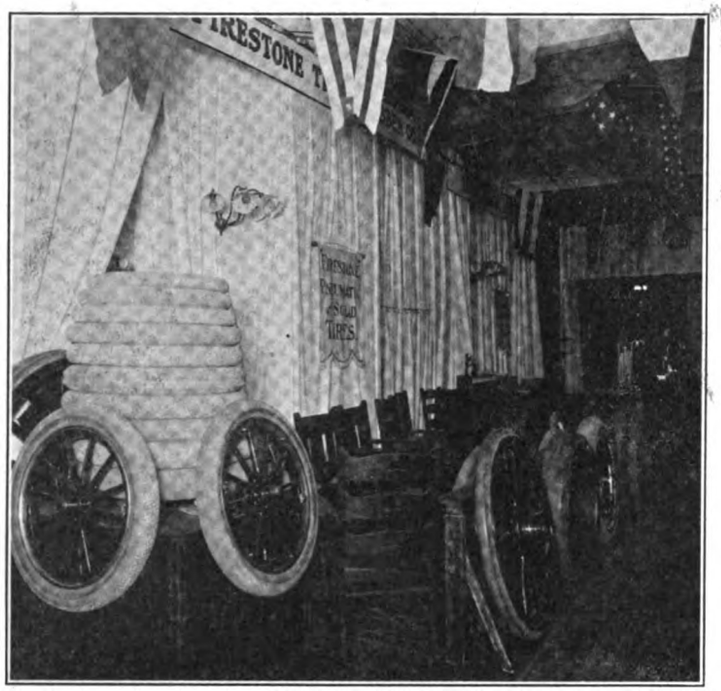
heavy vehicles, gasolene driven, and intended for the arduous service of the heavy duty truck. Electric propulsion gained its share of publicity through the exhibits of the Lansden, Pittsburgh Motor Vehicle and Commercial Truck Co., of America's exhibits.

In the latter case, a particularly neat adaptation of the worm drive principle was shown on a heavy delivery wagon. The single driving motor is enclosed in a full steel housing which is bolted firmly to a tubular member enclosing the short length of driving shaft and made integral with the upper section of the differential and worm gear housing. The unit housing thus formed acts as combined motor and drive enclosure and torque resisting member, and is suspended from the frame at its forward end.

The Lansden exhibit, in addition to a display of trucks and wagons of different sorts conforming in general to the previous practice of this maker, also featured a unique platform truck intended solely for industrial transfer purposes. It consists of a low platform, supported on a pair of driving wheels placed under the centre and a single steering wheel mounted centrally under either end. The platform being divided at the centre any inequalities in load or road surface are compensated for by flexure in the chassis, so that uniform traction always is secured for the steering wheels. These are cross-coupled and may be controlled from either end, the steering wheel and controller lever being removable. The affair shows great promise and affords a welcome hint at one of the greatest possibilities in the future of the electric vehicle.

Commercial types of vehicle also were shown by the makers of the Maxwell, Atlas, Holsman, McIntyre and Brush cars. An unheralded newcomer was the Saurer truck, a Swiss importation, which was staged among the accesories on the second gallery, where its carburetter and motor starting and braking devices were the chief objects of attention.

DEVELOPMENTS IN FOREIGN PRACTICE.



The foreign section, dignified by little signs attached to the cars showing that the exhibitors were mebers of the Importers' Automobile Salon, furnished a number of interesting contributions to the show, among them none, perhaps, more significant from the trade standpoint than those contained in the exhibits of the DeDion, Renault and Delahaye agents, where were shown types of the light car construction which is enjoying a brisk renewal of European popularity. The DeDion machines, with one exception, were of the single cylinder variety and mounted with bodies to accommodate different numbers of passengers and of types ranging from the semi-racing to the taximeter cab. The taxicab chassis already in general use in New York City was shown on the Delahaye stand, while the Renault exhibit revealed in addition to a number of large cars, a little twin-cylinder runabout in every sense of the word a miniature roadster, equipped with top, magneto ignition, and the full list of accessories and other equipment.

Magnificent examples of block cylinder casting were shown on the Fiat, Delaunay-Belleville and C. G. V. stands, the latter display featuring the new light pleasure and cab chassis, fresh from the recent Paris Salon, which mounted the unusual arrangement of the dashboard radiator, somewhat similar in principle to that so long employed by Renault, but differing from it in the direction taken by the air currents, and also from the fact that the cooling fan was encased within the radiator proper in an opening formed in its central section. The new Lancia car, with its neatly designed power plant and careful workmanship, attracted the attention which its recent racing notoriety sufficed to induce, while the details of its construction were such as to fix attention so drawn.

For the most part, the construction of the foreign vehicles was mainly a reproduction of that already seen at the Importers' Salon in New York last spring.

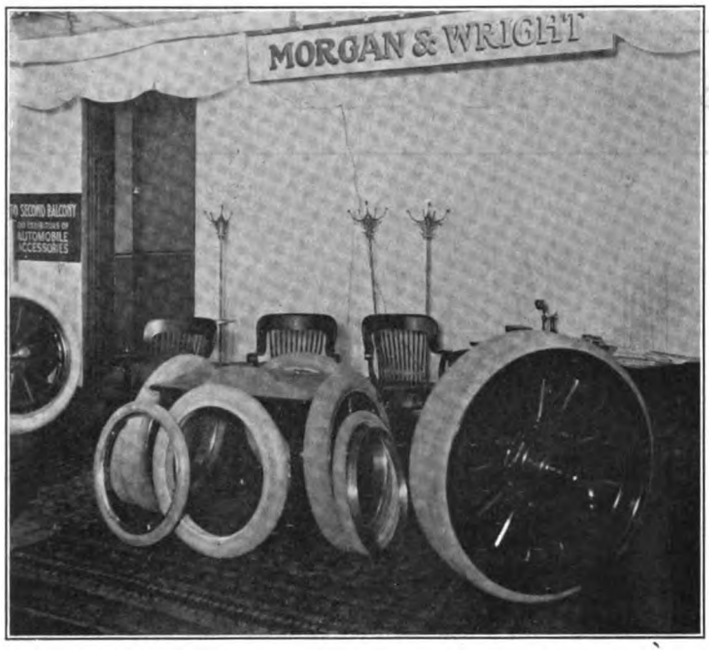
PARTS AND ACCESSORIES AT THE PALACE SHOW

New Things Shown in the Display of Tires

When the girls of the village blossom out in new raiment on Easter Sunday they are the same girls as before, but they look better than ever, and similarly at the automobile shows the majority of the accessory exhibits are not strangers to the public and the trade but they look particularly new and fresh in their show-time clothes. Here and there real novelties do appear, however, so that the seeker after these is sure to be in some degree rewarded.

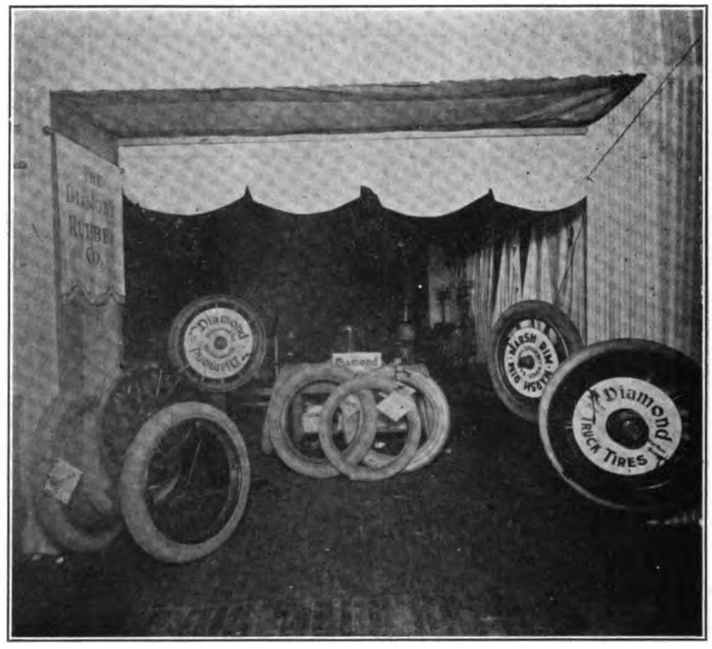
At the Palace show, the visitor came upon the exhibits in very mixed order so far as concerned the nature of the articles shown. Tires, ignition devices, lubricants, axles, speed indicators and all the variety of things which are included in the general group were arrayed side by side without classification. In a way, this contributed to the interest, each stand being quite unlike its neighbor as to the character of its wares.

It took investigation to discover the new things but there were quite a few of them —even more than the forecast had indicated. What contributed most to the value of the accessories exhibits, in the opinion of many, was the wealth of demonstration apparatus installed by the exhibitors for making clear by scientific means the merits of their goods. This effort to reinforce verbal argument with proof appeared stronger than at any previous show, and was particularly observable in the ignition exhibition. The production of so many new magnetos, as well as new types of coils, timers, distributers and the like, indeed gave a big incentive to such demonstrations. The ignition people were at every turn, and with their blue sparks flashing no matter which way the eye roamed, they quite ozonated the atmosphere. But the speed indicator, shock absorber and other exhibits were likewise alive with action.



Makers of parts and purveyors of special metals were present in significant force, many of them looking for business in the far future rather than for any immediate accessions to their contracts. Concurrent with the first exhibition appearance of new ideas and construction in parts makers' products, however, some of the newer cars were found to contain them.

Demountable and quick acting rims flourished in nearly all of the tire exhibits and in some instances separately. Radical innovations in tires themselves were not apparent, although there were a few novelties and variations in the working out of familiar ideas. Among the newer products was an inner tube really consisting of several tubes, contained one within the other. Upon the bursting of the outer tube, the air valve could be turned to a position where pumping would inflate the next tube, and if that were to meet with accident the valve could be turned to inflate still a third tube contained inside the others. The device was heralded as the Faultless tube. A line of "motor buggy" tires was disclosed at the Swinehart stand, in recognition of the growing use of this type of vehicle, while special soft, resilient tires for electric pleasure cars were to be found at several stands.



Tire shooting constables can be handed the "merry ha-ha" by the driver whose car is equipped with "bullet-proof" tires, as exhibited by the Zeglen Bullet Proof Cloth Co., of Chicago. For the fabric, real bullet proof cloth is used, such as is utilized for policemen's vests. It is made of heavy silk threads, woven in a peculiar manner. Revolver shots at close range cannot puncture it, and the flattened bullets that in tests had vainly tried to penetrate the cloth formed part of the company's exhibit. It was pointed out that where bullets fail, not much chance is given to nails, broken bottles and other unpleasant tire deflators. The casings using the bullet proof cloth cost in the neighborhood of $100 apiece.

The $5 prize hung up once a day by the Continental Caoutchouc Co., of New York, for the quickest change on their demountable rim, attracted some nimble workers and served to acquaint many owners and drivers with both the construction and the merits of the device. The company's display included Continental round tread and "AC"

Digitized by Google

MORGAN & WRIGHT TIRE EXHIBIT

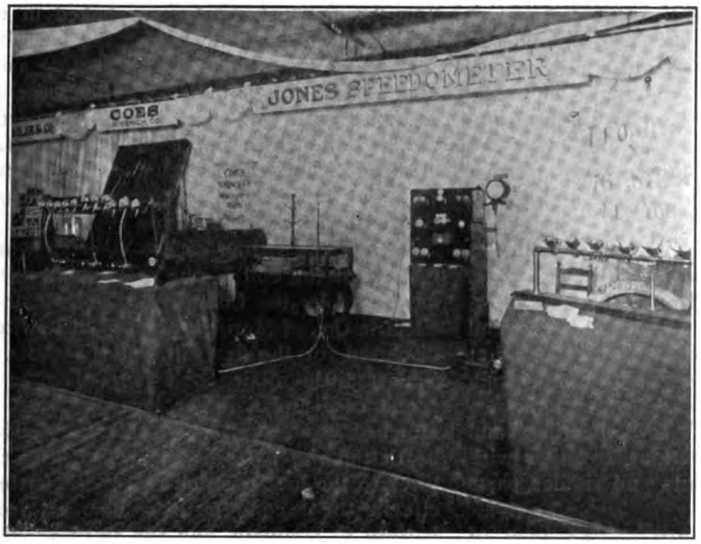
DIAMOND TIRE EXHIBIT

flat tread, the flat tread type course and the non-skid steel studded tires, guaranteed for 3,500 miles, 4,500 miles and 2,000 miles, respectively.

Following the development of its demountable rim for racing purposes, the Diamond Rubber Co., of Akron, O., has produced a simplified and improved form for the tourist. This rim was shown at the Diamond booth as one of the features, together with Diamond grip tires and the many other styles in the established line. At the Morgan & Wright display the leaders were the new heavy, flat tread tires and the new "Standard Universal" quick detachable rim. In the former an increased traction surface has been obtained by increasing the width as well as the thickness of the tread. It is claimed that although giving increased puncture protection and greater traction, this construction has been effected without a diminution of the tire's resiliency or an increase in the liability to fabric separation. The makers' tests have developed an increased traction efficiency in this type over the regular round tread of as high as 50 per cent. in some sizes and an average of 33⅓ per cent.

Decorations of automobile tires equipped with wings were scattered so generally through the building that the casual trade visitor might easily have received the impression that the whole show was dominated by and given in honor of the Hartford Rubber Works Co., of Hartford, Conn., for whom the symbol in question has long been a trade mark. There was considerable comment and amusement over the fact that some of the company's rivals sported the Hartford winged-tire on their decorative signs. The company did not suffer by the unintended spread of its mark, but was conspicuously present, anyway, and enjoyed a prominent location. The new "Standard Universal" quick detachable rim was also on display at the Hartford stand, together with specimens of the new large size tires to fit 30x3½ and 32x3½ rims, respectively.

Modelers' clay in a long strip on a board hung at the corner of the space of the Firestone Tire & Rubber Co., of Akron, O. The clay bore the imprint caused by the passage over it of one of the new Firestone non-skid tires, which was recently brought out. It will be recalled that the tread of the Firestone has raised lettering in rubber, reading "Firestone Non-Skid," the letters themselves affording the variety of angles, edges and points of road contact necessary for the non-skid effect. In reverse the clay showed the lettering plainly, just as the impression would be made in a soft spot on a country road. The Firestone demountable rim, which may be used in connection with either clincher or quick detachable tires was made prominent, visitors being reminded of the success with which the equipment was used by the winning Locomobile in the Fairmount Park race at Philadelphia. The regular line of Firestone tires made up the balance of the display.



"How about Lohengrins in a Goodyear air bottle?" was one of the perplexing questions of the show, resulting from the fact that one of the larger sizes of these ingenious compressed air containers was used to operate the three-octave Gabriel horn which occasionally supplanted the band in supplying music. It was found that the capacity of such a tank was greatly in excess of any estimate that would be made by the appearance and size of the bottles used. These bottles, which inflate tires more quickly than any pump, were the headliners in the exhibit of the Goodyear Tire & Rubber Co., of Akron, O., and ranged in size from little fellows up to enormous affairs for garage use, fitted on trucks so that they may be wheeled from one place to another. The main body of the exhibit, of course, consisted of the Goodyear detachable and clincher tires in plain, heavy tourist and Bailey treads, together with the Goodyear quick acting rim.

Leather-covered, steel studded tires have been added to the line of Empire tires, made by the Empire Automobile Tire Co., of Trenton, N. J. Attention was directed to the fact that the studs in the tread are set within a cut, hardened steel washer, giving greater traction surface than the ordinary stud, and so hardened as to be almost unaffected by wear. The Empire red rubber tubes and patches were also shown, as supplements to the line of outer covers.

"That casing looks as if it needed a shave," was the stock and somewhat bromidic joke which the passers-by perpetrated on the demonstrators at the Republic stand, where the new stagged tread, non-skid tire was on view. The basis for these humorous attempts was that in the molding of the tread with its rubber projections, small hair-like ends are formed in the air outlets of the mold and these were not removed from the exhibition tire. To test the quality of the rubber used in the tread, visitors were privileged to pluck at the rubber bands.

Numerous types of cushion and solid tires were staged, from the kind having big solid rubber pads like elephant's feet to near-pneumatics and very soft, light tires for electric carriage service. The accessories of one kind and another were also plentiful, from chain grips, as shown by the Weed Chain Tire Grip Co., of New York, to tire jackets of the latest cut, fashioned to accommodate spare tires with demountable rims. Outside non-skid treads, electric vulcanizers, acid cure solutions,

Digitized by Google

JONES SPEEDOMETER EXHIBIT

STEWART & CLARK SPEED INDICATOR

gum fillings, blow-out emergency patches, and a host of other tire things, such as pumps, pressure registers, tank inflaters, tools, and the like were plentifully in evidence. The Stepney spare wheel, carrying inflated tire and ready to slip on where the regular tire has met with trouble, was revealed in various sizes and colors, one of the models being a "combination" wheel capable of being fitted to two different sizes of rim.

SPEED INDICATORS NEW AND OLD.

Throwing steel nails at a big suspended magnet was the diversion offered by the Warner Instrument Co., of Beloit, Wis. After the bystanders had thrown all the nails the magnet would support, the boy in charge pressed a button breaking the circuit, and the nails tumbled down on a flat table beneath with a clatter that startled everybody in the vicinity. The apparent object was to impress the onlookers with the fact that the Warner Auto-Meter is actuated on the magnetic principle as distinguished from other speed indicators. The new Warner instruments differ radically from the former models, and have a circular case enclosing the mechanism, including the odometer. The readings appear through openings in the face of the case. The speed indicator is of the same interior construction as formerly, but the odometer is now of the company's own manufacture and registers to 1,000 miles in the trip and to 100,000 miles in the season total. A small electric light, concealed under the glass, makes it possible to illuminate the whole face of the instrument at night. A fixture combining a clock is supplied if desired. The old model Auto-Meter is still retained, but is sold at a reduction of $25 in the price. Four instruments were displayed at the show, including the old and new models with and without the clock. A tachometer for r.p.m. readings was also shown, operating on the same magnetic principle as that employed in the automobile speed indicators.

Nineteen models of Jones speed indicators, odometers, clocks, annunciators and other specialties were mounted in the Jones Speedometer stand, not to mention the new taximeter which the company is producing. The speedometers ranged in price from $15 to over $100, the low price instrument being one of the new productions for the coming season. Display cases contained the internal parts of some of the speedometer mechanisms, arranged under electric lights to show the high quality of the workmanship.

NEW WARNER AUTO-METER

At the exhibition space of the Stewart & Clark Co., of Chicago, two general types of speed indicators were shown. Most of the models were of the centrifugal type, but the latest addition to the Stewart family is an instrument working on the multipolar induction principle. In prices from $15 up, the speed indicators were ranged in the whole variety of the extensive line which the company is putting out, and some of the combinations with clocks were also on view. Favored visitors at the Steward space were given medals so much like gold in appearance as to be highly ornamental, while bearing a bas-relief of the leading Stewart speed indicator on one side and on the other a familiar but expressive motto as to the tribulations of poverty. Several lesser known makes of speed indicators were staged at the show, but this year found no new manufacturers essaying the field.

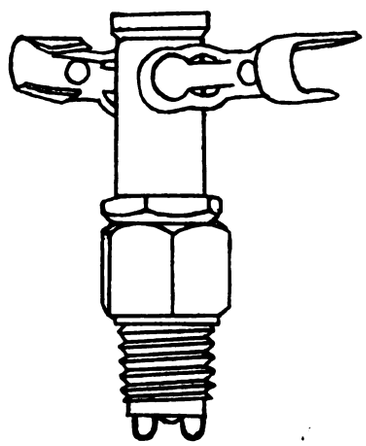
IMPROVED SYSTEMS OF IGNITION.

More magnetos and simpler, better ones than at any previous show were to be found among the ignition exhibits. The list of magneto makers has been considerably increased, and about a dozen different makes were disclosed. As becomes veterans in the field, the Bosch Magneto Co. had quite a large space where both high and low tension types were mounted. The exhibit was very complete, the different types of magnetos being arranged with hand cranks and the necessary sparking equipment so that the visitor could see each type in actual operation. Spark plugs and magnetic make-and-break devices completed the display.

From New England two new magnetos appeared, bearing the Heinze and the Pittsfield name-plates, respectively. Both high and low tension magnetos are being made by the Heinze Electric Co., of Lowell, Mass. The magnets are curved to a circular form and the complete devices are enclosed in long cylindrical cases. The design contemplates the use of the magnetos in places where the height of the ordinary magneto forbids. The Heinze company has also taken up the manufacture of spark plugs this year, and is supplying them in both mica and porcelain insulation. A feature of the exhibit was a complete arrangement of timer, coil and spark plugs, all eight times as large as the normal size, but operated the necessary sparking equipment so that

Digitized by Google

mous coil and plugs, with the big sparks which the latter gave off, suggested in appearance the ignition equipment of a giant's car.



The show space of the Pittsfield Spark Coil Co., of Dalton, Mass., was full of other things beside the new magneto which the company disclosed but the enthusiasm of the attendants was all for the new product. Both the primary and secondary windings of the device are in one vertical coil at the end and outside the horseshoe magnets. Extension pieces at the top and bottom bring the coil within the path of the magnetic lines of force. The coil is stationary, but is easily removable. The balance of the Pittsfield exhibit was made up of such devices as timers, distributers, spark plugs and coils. A new "short coil" has been introduced in the company's line, being about two inches shorter than the regular coil. It is fitted with a pair of hinge brackets, which allow it to be dropped forward to take out the units for adjustment. This feature is of especial value where there is an overhung dash. The coil is fitted with a kick-off switch which can be assembled for either two sets of batteries or for magneto and battery.

Remy high tension alternating current magnetos appeared in considerable numbers at the exhibit of the Remy Electric Co., of Anderson, Ind. They were shown equipped with distributers for two, three, four and six cylinder motors. In the Remy the winding is stationary, doing away with moving contacts for the primary circuit. The latter is conveyed to a dash coil of special design, from which the secondary circuit is led to a distributer on the magneto and thence to the various cylinders. Years of experience have been incorporated in the 1909 models, and the latter are distinguished for a compactness and neatness of finish that properly reflects their interior excellence.

A white marble display board was one of the attractions in the space of the Splitdorf Laboratory, of New York. Mounted on the board was a Splitdorf coil and a revolving arm from which high tension sparks jumped to four brass plates arranged in a circular path. The mechanism was operated by a motor controlled by a rheostat to give any desired speed. The board showed the action of the Splitdorf magneto in connection with the Splitdorf coil. A small glass chamber containing a set of sparking points and equipped with a connection to a pump so that the interior air pressure could be raised to correspond with the compression in a motor cylinder, was also a part of the display board fittings. Through the glass it was observable under test that while the spark from battery ignition is inclined to diminish and fail as the pressure is increased, magneto ignition gives a bigger and more brilliant flame the higher the pressure goes, a phenomenon that proved very surprising and interesting to visitors.

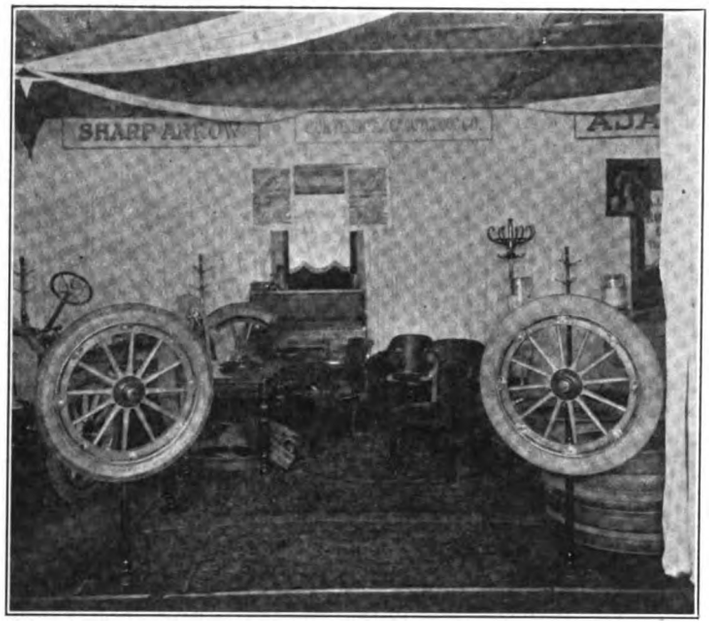
To overcome the difficulty of starting large motors on the magneto, an ingenious device has been embodied in some types of the U. & H. magnetos shown by J. S. Bretz, of New York City. No matter how slowly the motor—and correspondingly the magneto—may be turned, the device in question gives a quick snap to the rotation of the magneto armature, thus producing a strong spark. When the motor has attained speed, the device automatically retires from action and the magneto takes its drive in the ordinary way. Various models of the U. & H. were displayed in the Bretz space, all showing a high perfection of workmanship and excellent design. The magnetos were but one of several lines of automobile specialties that Bretz handles, however, the exhibit also including F. & S. bearings and Bowden flexible connections, together with Hartford universal joints and similar parts and accessories.

Another German magneto but now of American manufacture was shown in the

EDISON DOUBLE SPARK PLUG

Hess-Bright, while at the Wheeler & Shebler space a magneto of new design and very low price was displayed. The Motsinger dynamo generator, used in connection with ar accumulator, was represented, being the only one of its type at the show. At the stand of the Witherbee Igniter Co., of New York, the new Volta magneto was on view, bearing evidence of the quality and efficiency which characterize all of the Witherbee products. The well known Witherbee igniters were likewise displayed, together with an imposing array of Wico timers, distributers, switches, spark plugs, lamps and similar electrical accessories. Winking lights and flashing sparks in the exhibit served to draw visitors to a closer examination of the devices as shown in actual operation.

Two plugs in one were demonstrated by the Edison Auto Accessories Co., in their Edison plug, which contains in one porcelain two distinct and separate sets of electrodes. The diameter of the porcelain core in this plug is not much greater than that in the single plug, despite the fact that it contains the double system. The plug is of the conventional, the secondary contacts being on the side instead of on the top. The "central" electrodes are baked in the porcelain and come flush with the porcelain surface at the bottom, not projecting as in commonly the practice. The base is equipped with two wire "points", one from either side, which curve over the central electrodes and recive from them the spark. The plug is designed to be used in connection with the double ignition system.



Putting the switch on the steering wheel instead of the coil is one of the new ideas developed by the Connecticut Telephone & Electric Co., of Meriden, Conn. The switch, disclosed for the first time at the show, is a neat little affair consisting of a small round case and a finger lever. It can be attached to the steering pillar or underneath the rim of the wheel. Pressing the lever to the first position closes the battery circuit, the second position changes from battery to magneto, and the third position throws both the battery and the magneto circuits into operation together. Thus the car may be started on the battery and later switched to magneto or both without reaching down to the coil. The Connecticut exhibit, of course, listed the company's coils, timers, distributers, switches, indicators and quick detachable primary and secondary terminals.

During the week many of the ignition exhibitors took advantage of the National Carbon Co.'s pretentious testing apparatus for determining the action of coils, timers, distributers and the like, particularly as to current consumption and accuracy of timing. The indicators registered in units of one-thousandth of an ampere in disclosing the current consumption, while the revolving sparkers on a black background showed just how many sparks were delivered to each cylinder and at what point in the stroke. Four sets of ignition apparatus could be tested in comparison at one time, and the wide difference in the showings made was the occasion for no little astonishment at times, not to mention some warm feeling. The National company, as a matter of course, openly favored those forms of ignition outfits which were the most economical in battery current consumption and which would thus insure satisfactory service from the igniter dry cells and the "multiple" batteries which the company offered.

Numerous improvements in ignition apparatus were shown by other exhibitors, including a new form of Atwater Kent sparking device, and a "battery saving timer" perfected by the Autocoil Co., of Jersey City. Porcelain extension terminals were featured on Kingston coils, the terminals extending through the dash so that the wiring might be concealed.

Reliance spark plugs, made by the Jeffry-Dewitt Co., of Newark, N. J., have undergone refinements since they first were introduced two years ago. Where formerly a slight gap was incorporated under the cap, is now a pellet of high resistance metal which supplies the advantages of the gap but lacks its objectionable features. The

CONTINENTAL TIRE EXHIBIT

J. S. BRETZ CO.'S EXHIBIT

makers of Reliance have brought out a new plug to be sold for considerably less, called the J. D.

The Auto-Contact battery box, exhibited at Chas. J. Downing's space, is designed to hold dry cells and to connect them in various series and multiple series combinations without employing wires. The contacts are made through the agency of stiff copper flat springs which are attached to the box lid. When closed these metal surfaces bear on the battery terminals while the nature of the connection is controlled through the agency of two switches contained within the box. The claim is made that with this battery case there will be no batteries improperly connected, no loose or broken connections, no accidental short circuits and that the cells can not be improperly placed. The box is made of metal and is in several sizes and colors.

A simple and effective lock switch for attachment to the coil box has been produced by the Safety Device Co., of Indianapolis. The appliance consists of a Yale lock and a two-way switch for use in connection with two sets of batteries or for a battery circuit and a magneto. The possessor of the key can use either of the circuits, but when the lock is closed and the key not at hand, it is impossible to make use of either circuit without destroying the coil. The device may be attached to any coil and is also applicable to electric vehicles.

Of the Patterson wireless dry battery holder, exhibited by Stanley & Patterson, of New York, the chief feature is the molded rubber composition plate which forms the top and into which as been incorporated threaded sockets to receive the cells. Each threaded socket or cell receptacle is provided with an automatic bridge of heavy spring copper. To connect the cells one need only screw them into the receptacles and proper contact is made. If for any reason it is desired to reduce the number of units the required number of cells may be screwed out a turn or two and the series contact between the other cells will be maintained through the automatic bridge. No wiring is employed and no operation is required to connect the cells other than the simple act of screwing into the receptacles. By an ingenious device, which also is protected from moisture, it is possible without opening the box to obtain any combination of connections which may be desired. By altering the position of a thumb screw a series connection, a multiple-series, or half the cells, with the balance in reserve, may instantly be obtained. Cells with the necessary screw tops can now be obtained from most battery makers, it is claimed.

The dry cells of the Eastern Carbon Co. have been familiar to patrons of automobile shows for several years, but this year the company showed something new. The innovation takes the form of a square cardboard box which is now supplied to whoever prefers it to the conventional round jacket formerly used. The advantage of the square box is that it prevents the cells from turning and that it keeps the battery in the position in which the user places it.

Despite the fact that in the field of carburetters the Stromberg is known as "the one with a glass float chamber," this transparent feature is one of the least important of the claims put forward by the Stromberg Motor Devices Co., of Chicago. This carburetter is of the float feed type and in demonstrating it to the public, the exhibitors called attention to the fact that the instrument contains a fine woven wire gauge through which the gasolene must pass before entering the float chamber. The gauze serves as a separator and prevents the introduction of water into the motor cylinders. The usual form of needle valve to control the gasolene flow is employed, but the needle has an unusual feature in that the upper part of it is surrounded by a spiral spring which tends to keep it from being jounced out of its seat and assists in maintaining a constant level. On the top of the float chamber, on the outside, is incorporated an adjusting screw by means of which the gasolene level can be altered. This adjustment is of special value on force feed cars where it tends to encourage the fuel consumption by maintaining a constant level under conditions of pressure. The gasolene passages throughout the carburetter are accessible from the outside, opportunity being given by this arangement for cleaning by removing threaded plugs. The spray nozzle is not adjustable, the fixed opening having been designed for duty without recourse to the familiar needle-valve adjustment. Through a choked air passage that creates a high velocity of air at all speeds the gasolene is drawn from the nozzle in ratio to the speed of the motor. This feature is responsible for the ease with which an engine can be started. The spray, as it leaves the nozzle, falls on a wall heated by a water jacket surrounding the wall. The result is immediate vaporization. The auxiliary air is introduced through this heated chamber by means of a valve controlled by two springs, one spring operating at low speed and the other drawn into action at high speed. The entire instrument is highly finished and with its glass housing around the float chamber, presents an attractive appearance.

A two port carburetter made in various sizes made the sole exhibit of the Allen Fire Department Supply Co., of Providence, R. I. A horseshoe shaped cork float controls the gasolene level, a spray nozzle with an adjustable needle valve regulates the vaporizing and a sliding valve serves for throttle control. A single port suffices for the air intake at low speeds while the open-

Digitized by Google

ing of the throttle brings the auxiliary into service and increases the speed of the motor. The carburetter does not contain springs, a diaphragm or sensitive valves. An adjustable low throttle varies the density of the vapor according to the r.p.m. of the motor.

On the theory that vapor is more perfect when the gasolene is drawn through a small jet, two small rather than one large fuel opening distinguishes the Economy carburetter, invented by Adolph Saurer, of Switzerland, and exhibited by Albert Otto, of New York. A float chamber contains a brass float which controls the gasolene flow through the usual needle valve medium. The outlet from the float chamber is a straight channel in the bottom of the mixing chamber. From this channel the two jets rise, though in separate chambers. One of the two jets or nozzles is in service whenever the motor operates. When the opening of the throttle increases the speed of the motor an automatic clock valve is caused to open, bringing into service automatically the second nozzle. The clock valve is controlled by a plunger in a dash pot working against a spring.

In the improved Webster gasolene gauge, disclosed at the stand of the Randell Faichney Co., of Boston, is found a method of attachment obviating the use of the blow torch or soldering iron, yet permitting an entirely tight union which anyone can make in a very few minutes. As an integral part of the gauge base, near the dial, is arranged a flange with slotted ends. Three holes are drilled in the tank, the larger or center one being for the body of the gauge, and two smaller holes to coincide with the slotted flange. Through the larger hole is inserted a collapsible collar which when opened inside the tank brings into position three holes similar to those drilled in that receptacle. The two end holes in this collar are tapped for 10-24 machine screws With the collar in place the screws are turned in, first passing through a flexible gasket on the outside of the tank. All that then remains to be done is to insert the gauge in the tank, place the outer flanges so that the screws pass through the slotted ends, tighten the screws, and an air tight union is effected. The gauge proper has not been changed save in one important item, the price, and this item has been reduced despite the improvement.

A new separator with simple mechanism developed comment at the exhibit of the Austro-American Separator Co., of Cleveland, O. The No-Shammy Automatic Separator consists of a tubular compartment in which a float, so made that it is lighter than water and heavier than gasolene. As water accumulates in the tube the float rises until eccentrically a needle valve enters its valve seat and shuts off the supply from the tank. Opening a set cock in the bottom of the float chamber draws off the water, the float falls, the needle valve opens and the contents of the tank may again circulate. A small quantity of water in the chamber does not affect the gasolene which passes over the top of it, but when the water has risen to an extent where a little more would permit it to enter the pipe leading to the carburetter the float automatically checks the flow until the chamber is drained. Obviously the separator is incorporated in the gasolene line, between the tank and the carburetter.

GENERAL ACCESSORIES.

In the general accessories the Gabriel horns, cut-out valves and shock absorbers made by the Gabriel Horn Mfg. Co., of Cleveland, were conspicuous, the Gabriel combination of some 39 separate horns operated from a musical keyboard being one of the big features of the show. In lamps the Badger Brass Mfg. Co.'s exhibit was as complete as could be found. The Besnard system of lens and reflector arrangement was shown in the larger types of the Kenosha company's "Solars" and the eclipsing device for lessening the light when driving on city streets was mounted for examination. Charles E. Miller, the New York importer and jobber, in addition to a regular line of accessories, offered a new automobile headlight of enormous candlepower, the light being supplied by an incandescent mantle heated by a gasolene flame.

In even so minor a thing as an oil gun, the exhibits disclosed many detail improvements. One of the newer types has a hinged spout, which when turned up parallel with the barrel closes a valve at the bottom and prevents any outflow, but which in action may be turned at right angles to the barrel, to get into awkward places, or may be extended straight down as in the ordinary gun. The piston and plunger are also devised so that with the spout turned up, the gun may be carried full of oil in the tool kit, without danger of leakage. The gun, which made its first appearance at the show, has been named the Autocrat and was among the specialties displayed by the American Thermo-Ware Co., of New York.

A shock absorber exhibited by Ernest Fientje, of Cambridge, Mass., consists of a cylinder and piston made of prosphor bronze, connected to the car by steel hangers. The cylinder is tubular shaped and contains, in the larger size, a quart of glycerine. The piston is made with four holes about ¼ in. in diameter, and two holes about half that size drilled through it. Over the larger holes caps are arranged which permit the glycerine to freely pass through on the downward motion of the body but which close on the recoil. The smaller holes are always open. The absorber is to be attached to the body of the car and the axles. When a jounce is encountered the downward movement is not checked unless the action is violent, when it is quickly overcome. At the rebound of the body the larger holes in the piston are automatically closed so that the glycerine is permitted to return to its storage chamber through only 15 per cent. of its channels, causing the body of the car to rise slowly and gradually. The operation of the device is noiseless and all parts are sufficiently strong for their work. The absorber is made in two sizes.

The Joyce-Cridland telescoping motor jack, shown by the Joyce-Cridland Co., of New York, consists of two screws, one inside the other, both screws operate at the same time, permitting twice as much lift or drop as the single screw jack to an equal amount of handle motion. The handle, which moves in a horizontal direction, is equipped with a ratchet and the usual ratchet control pawl. The inner, solid, screw is made of high grade steel; the outer, hollow, screw and the base are of selected malleable iron; the base contains a well of oil into which both screws dip when not in use, lubricating them thoroughly and adding to the life of the threads and minimizing friction.

A self-starter exhibited in connection with the Sauer motor truck was offered as being of unusual merit. To the chassis is attached a long cylindrical pressure tank supplied by an air compresser which, when needed, is operated by the main driving shaft of the car. From the tank a pipe conducts the air to a manifold located on top of the engine. The manifold has ducts leading to the cylinders and contains a four way valve, the operation of which is controlled by the cam shaft. When it is desired to start the motor a lever attached to the dashboard is thrown in position and air is released into the four-way valve which directs it into a cylinder, starting the motor. The air pressure required for the initial movement is very little, and the directing valve continues a distribution of the air pressure to the cylinders until the lever is thrown out of position and the normal function of the engine commences. Throwing the same lever in another position engages the air compressor, the tank is refilled until a gauge, located also on the dash, signifies a sufficient storage, when the lever will discontinue the action of the compressor. By throwing the throttle lever past the "off" position, the turning of the engine may be altered by the shifting of the cam shaft and the cylinders made to act in compressing successive charges of pure air drawn through a special part in the intake connection, whereby any desired amount of braking effort may be secured and the cylinders given the additional benefit of a thorough scavenging.

Suggesting in appearance a cross between some kind of a hand truck and an equally queer looking amusement device, the "Auto-Creeper," brought from Syracuse by The Brown Co., of that city, was explained to be a useful appliance for anyone who has to crawl under a car to do repair work. The "Creeper" is about 4 feet long and 2 feet wide. It is composed of 5 wooden slats laid on two cross beams, castors are set in the braces and the whole thing is only 4 inches high. Its purpose is to provide easy access to the under parts of the car with-

Digitized by Google

out requiring the repair man to crawl through or lie in any grease which may be there. He has but to lie on the creeper, roll it and himself under the car and work from a more advantageous position than is possible when lying on the floor.

In the S. P. R. muffler cut-out the valve is made to open against the exhaust pressure, instead of with it as is the usual custom and often the cause of leaks. The cut-out is attached by clamping it in position so that the body covers the space in the bottom of the exhaust pipe where a piece has been sawed from the pipe near the muffler. This method of attachment does away with the necessity of removing the exhaust pipe for the purpose of attaching. The body of the cut-out forms a pocket into which much of the residue from the engine falls and this is forced out when the cut-out is opened instead of finding lodgment in the muffler. The action of the muffler can be directed by a foot pedal. The device was shown by the S. B. R. Specialty Co., of New York.

When it becomes necessary to inject five or ten pounds of heavy grease into a transmission case which is provided with only a very small opening, it is necessary either to remove the upper half of the case or inject the lubricant by means of a grease gun. The latter method is the simplest, but the difficulty with it lies in the fact that it is an inconvenient and slow operation to load the gun with the grease. In the Tuckahoe gun a means of instantly filling the magazine, even with the heaviest grease, has been devised. When it is desired to fill the inner chamber it may be easily removed and plunged into the grease, the piston is forced back by the entering charge, the air is expelled and the chamber fills. It then is replaced in the outer shell and operated in the usual manner. It is a cleverly worked out device and was shown by the Rubly Mfg. Co., of New York.

In the improved washer shown for the first time by the I. J. Smith Mfg. Co., of New York, the long pipe through which the water is conducted to the hose has the usual free circular movement, but it differs from the former type in that the pipe extends in the opposite direction considerably beyond the pivot on which it is hung, thus permitting the introduction of a counter balance which maintains the arm in a horizontal position when not in use. When it is desired to wash a car the attendant puts a slight strain on the hose, the pipe arm is inclined and the inclination opens a valve permitting the flow of water. The radius of the arm is sufficiently great to deliver a stream to any part of a vehicle without moving the latter, and the automatic cut-out serves to economize on the water by preventing waste when the apliance is not in actual use.

A dash shield with the lower section inclined toward the driver and the upper section in the usual perpendicular position was put in new by the E. T. Burrowes Co., of Portland, Me. In addition to the protecting qualities the shield has additional desirable features in that the slant of the lower section of the shield adds to the appearance of the vehicle and reduces the wind resistance to a marked degree. The shield has no bars across the glass and no extended supporting rods in front. There is nothing to rattle, yet it may readily be padded up or used in various positions. The exhibit contains also the Burrowes spare wheel and Burrowes number plate hangers.

PARTS AND MATERIALS.

For the eye of the manufacturer and the designer the offerings of special parts and materials covered an extensive range, from the steel frames of A. C. Smith and Driggs-Seabury down to the finishing fittings for bodies. Special metals were the subject of several exhibits, the different alloys offered

being characterized by individual merits of a nature to invite their use for this or that purpose. The display of the American Ball Bearing Co., of Cleveland, O., included front tubular and I-beam axles complete with hubs, the latter fitted with either the company's own make of 2-point ball bearings or with annular bearings of German manufacture. A complete line of bevel and chain drive rear axles was also shown, some of these being fitted with the 2-point bearings and others with the German annular bearings throughout, and still others fitted with roller bearings. One of the newer productions was a novel steel jacketed rear axle with planetary transmission, having automatic clutches all running in oil. In fact the steel jacketed rear axles shown deserved particular attention. The housings for both the differentials and the drive shafts were drawn from sheet metal. Some of the axles were fitted with short drive shaft for two universals and others with an extended shaft for one universal. In some cases the axles were shown with the adapter for receiving sliding gear transmission by bolting on at the upper end of the drive shaft. The display combination of the newer types with some of the standard axles which have been made by the company for well known cars for several years, revealed how much the automobile manufacturers lean on outside assistance.

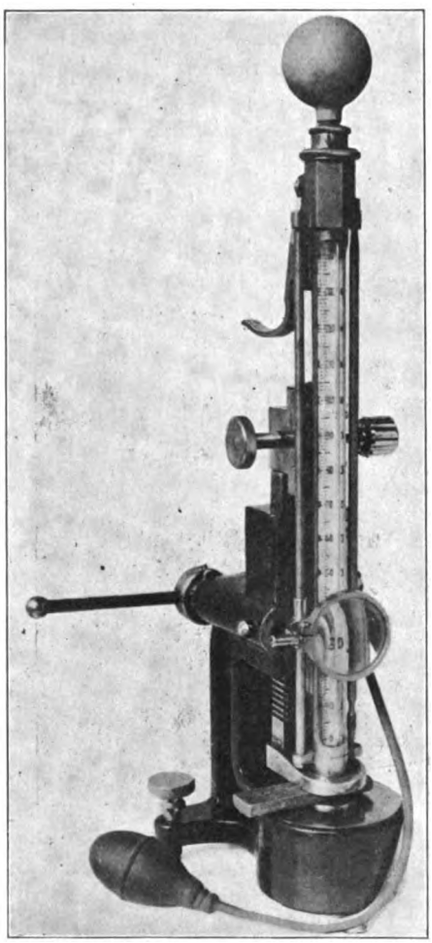
The great amount of publicity that had been given the new pressed steel rear axles of the Timken Roller Bearing Axle Co., of Canton, O., made these the subject of prompt inspection by inquirers in a position to contemplate their use as well as by the merely academic investigators. The feature of the steel casing which forms the housing is that it is one piece extending from hub to hub, tubular at and near the ends and tapering up to an enlarged globular center to receive the gear carrier. The latter, which contains the differential, bevel gear, pinion and all bearings, may be removed bodily from the axle proper without in any way affecting the latter and while the car rests on its own axle, if desired. Adjustment, which is provided for all bearings, can be accomplished entirely from the outside. The one piece steel housing is so designed that it is of gradually increasing strength toward the center of the axle and all sudden changes in strength of cross section have been eliminated. Consequently the usual truss rod can be done away with, improving the looks of the axle very materially. The axles are made in two sizes, of either the fixed hub or full floating type. The smaller size is made with long driving shaft and concentric enclosing tube. The Timken roller bearings were shown in a number of other axle and hub combinations.

Axles and bearings were also the elements of the exhibit made by the Standard Roller Bearing Co., of Philadelphia. An extensive variety of ball bearings was shown, of both the full and silent type, sets for some of the prominent cars which equip with Standard bearings being mounted under glass in suitable frames. Roller bearings had as the leader the new, improved Grant bearing, which is made interchangeable with any other form of conical or tapered roller bearing, while the new annular roller bearing was represented, the latter being interchangeable with the principal standard sizes of annular ball bearings. Thrust bearings, too, were offered. In the axle display the Standard three speed transmission axle was featured. In this the transmission is mounted on the rear axle within the same housing as the differential mechanism, comprising with the axle itself and its anchorage to the sub-frame of the car a very neat arrangement. Special axles as made to manufacturers' orders were likewise mounted on the display rack.

The many uses of Parsons' manganese bronze in front axle castings, steering gear castings, housings, brake banks, engine frames, lamp brackets, differential gear cases, transmission gear cases, levers and other parts were forcefully presented by the William Cramp & Sons Ship and Engine Building Co., of Philadelphia. Some of the larger specimens of rear axle housings cast in this metal were very remarkable. Bear-

Digitized by Google

ing castings of Parsons' white brass were likewise on view.



Steering, transmission and differential gears were plentiful. In steering gears the very newest to be disclosed was the product of the Baldwin Chain & Mfg. Co., of Worcester, Mass. In general principle it consists of a bevel pinion at the bottom of the steering pillar, the pinion engaging a geared ring which when rotated actuates the rocking arm. The Brown-Lipe Gear Co., of Syracuse, N. Y., revealed a new model transmission gear, together with its established line of older models in both progressive and selective types. The company's differentials and steering gears were displayed in several styles, as usual. The Warner Gear Co., of Muncie, Ind., in a comprehensive exhibit offered among other things a transmission and clutch group of radical design. The transmission is mounted and supported on the case surrounding the forward end of the propeller shaft, doing away entirely with any frame or sub-frame support. The transmission has the disc clutch unit contained therein, getting all the benefits of unit construction and at the same time avoiding putting the weight on the rear axle. The arrangement makes it possible to have the propeller shaft casing serve the triple purpose of radius rod, torque and support for the gear case.

Power plants of several makes were staged, the Rutenber motors of the Western Motor Co., of Logansport, Ind., being to the forefront. Three models of the four cylinder Rutenbers were shown and a six-cylinder 50 horsepower model. The radiator displays were not lacking. The Briscoe Mfg. Co., of Detroit and Newark, had a strong exhibit, a new radiator of the square effect Mercedes type being featured. Chains for all classes of service were offered by Charles E. Miller, of New York, with the famous Brampton line; by the Whitney Mfg. Co., of Hartford, Conn., with the numerous types of Whitneys, and by the Diamond Chain and Mfg. Co., of Indianapolis, Ind.

THE SCLEROSCOPE A FEATURE.

Sensational among the show exhibits was an instrument called the Shore "Scleroscope" for measuring the hardness of metals and the physical properties of materials such as rubber, fabric and other components of things used in automobile practice. Because of the technical nature of the instrument, probably the best presentation of its character and purpose is that offered by its manufacturers, which is in part as follows:

"As hardness is not an energy like heat, it could not act on or move an indicator unless energy is externally applied or stored up in the indicator. This is the underlying principle of the scleroscope, and the process is as follows: A tiny little plunger weighing about one-twelfth of an ounce is allowed to drop less than a foot in height inside of a highly polished glass tube on to the metal to be tested. The plunger or drop hammer has a diamond set in its striking point which enables it to slightly penetrate the hardest steel for an unlimited number of times. This penetration is simply nervous touch carried out very far and is for the purpose of getting the metal's own expression of its physical hardness or rigidity. When thus the drop hammer strikes a metal, it has stored up in it a certain amount of

SHORE SCLEROSCOPE

energy—enough to make it rebound almost the full height of the fall, provided none at all is absorbed by the metal or other substance. However, this is not possible, for there is always some energy lost due to the yielding of the material. Softer metals naturally yield more than hard ones and thus we come to be able to get responses from different metals with such a contrivance as the instrument in question, and it is very clear that the higher the rebound of the indicator hammer the greater must be the actual hardness of the metal. In addition to the energy absorption hypothesis, it has also been found that the harder the metal or other substance, the greater is its recuperative power after having caused a permanent deformation and its is this recuperative effort on the part of the metal struck that serves to throw up the indicator hammer to heights equal to the hardness of the metal. The recuperative power of a metal is not elasticity or resiliency.

"When soft lead is struck by this instrument, an indentation is made which if imitated by putting a steady weight on the same point, would require about twelve pounds. As the metals under test are harder, the weight must be greater, until when hard steel is reached more than a hundred pounds are required. As the area of the point is very small it will be seen that when these weights are multiplied by the said area enormous pressures are obtained. The actual striking force of the little drop hammer is thus estimated to be from thirty thousand to five hundred thousand pounds per square inch, or in the latter case over twenty thousand times its own weight.

. . .

"Hardness of a material having been duly measured, it is very easy to ascertain the other important properties of a metal by indirect methods, and when no further testing by expensive machinery is required. Hardness, multiplied by the degrees of flexure in bending a strip of metal until it begins to take on a permanent set, gives the approximate strength and elastic limit, while hardness multiplied by ductility, the total amount of bending in degrees, gives the ultimate strength."

The device was exhibited by the Shore Instrument & Mfg. Co., of New York. It is the invention of Albert F. Shore, who has developed in connection with it a number of valuable formulae for determining the qualities of various metals and materials. The attention it attracted from engineers and technical experts indicated how largely the latter are studying the problems of material selection.

Ramblers at a "Private" Show.

Among the several "private" shows which are being held this week, is that staged at the headquarters of the New York branch of Thomas B. Jeffery & Co., 38-40 West Sixty-second street. With interior and exterior handsomely decorated with American flags, bunting and evergreens, this exclusive exhibit is one to cause many a passer-by to pause, while the "Welcome to our Show" sign at the door is a cordial invitation to step inside. On the grade floor are displayed the various Rambler models in touring, roadster, runabout and close-coupled body mountings. They include a Model "44" close-coupled touring car, a spacious seven-seated Model "45," Model "35" shown in close-coupled and five-passenger styles, and two specimens of the popular two-cylinder opposed, 22 horsepower model. A polished 35 horsepower chassis sectioned to reveal the working of the parts, and beautifully executed, adds an effective finish to the array, while the new Rambler spare wheel, which is now a part of the regular equipment is a feature of practical interest. The exhibition will be continued at the salesroom until the close of the Madison Square show, January 23.

Summary of Automobile Exhibits, Including Exclusive and New Features

Acme Motor Cor Co., Reading, Pa. Acme gasolene cars. One 45 h.p. 6 cylinder touring car, one 45 h.p. 6 cylinder tourabout, one 40 h.p. 4 cylinder tourabout.

American Motor Car Co., Indianapolis, Ind. American Roadster gasolene cars. Three 60 h.p. 4 cylinder roadsters, one 4 cylinder touring car. On two roadster models wheels enlarged to 40 inches diameter. Exclusive feature: Under-slung frame, low center of gravity, clearance 12 inches.

Atlas Motor Car Co., Springfield, Mass. Atlas (2-cycle) gasolene cars. One 30 h.p. 3 cylinder touring car, one 30 h.p. 3 cylinder runabout, one 20 h.p. 2 cylinder runabout, one 20 h.p. 2 cylinder taxicab, one 20 h.p 2 cylinder delivery wagon. New models have centrifugal pump instead of thermo-syphon cooling, geared instead of belt driven fan. Atwater-Kent ignition system, sliding gear transmissions. Exclusive feature, construction of 2-cycle motor.

Austin Automobile Co., Grand Rapids, Mich. Austin gasolene cars. One 60-90 h.p. 6 cylinder touring car, one 60-90 h.p. 6 cylinder limousine, one 45-50 h.p. 6 cylinder touring car with close-coupled body, latter model new this year. Exclusive feature, demountable baby tonneau or rumble showing no separation.

Benz Auto Import Co., of America, New York City. Benz gasolene cars. One 40 h.p. 4 cylinder limousine, shaft drive; one 40 h.p. chassis, chain drive, and Grand Prize 120 h.p. racer. Special feature: demountable limousine.

Brewster & Co., New York City. Delaunay-Belleville gasolene cars. One 25-40 h.p. 6 cylinder chassis, one 10-15 h.p. 4 cylinder chassis, one 20-30 h.p. 4 cylinder landaulette. New 6 cylinder model. Ignition changed from make-and-break to Bosch, and chain drive changed to shaft. Cylinders on light models cast en bloc.

Brush Runabout Co., Detroit, Mich. Brush gasolene cars. Two 7 h.p. 1 cylinder runabouts, one 7 h.p. 1 cylinder delivery wagon and "New York to San Francisco" runabout. New multiple disc clutch, planetary change gear and carburetter. Exclusive feature: use of wood in frame and axles, spiral springs, change gear design.

Buckeye Mfg. Co., Anderson, Ind. Lambert gasolene cars. One 35 h.p. 4 cylinder touring car, one 35 h.p. 4 cylinder roadster, one 28 h.p. 4 cylinder baby tonneau, one 28 h.p. chassis, one 20 h.p. 2 cylinder runabout. Latter model entirely new. All friction driven. Silent chain and internal expanding brakes new feature. Exclusive feature: friction transmission.

C. V. G. Import Co., New York City. C. G. V. gasolene cars. One 20-30 h.p. 4 cylinder, chain drive limousine; one 12-15 h.p. 4 cylinder chassis, shaft-drive; one 12-15 h.p. 4 cylinder runabout, one 8-10 2 cylinder town car. The two lighter models new this year. Exclusive feature: radiator mounted in dash with fan enclosed.

Cartercar Co., Pontiac, Mich. Cartercar gasolene cars. One 24 h.p. 2 cylinder touring car, one 24 h.p. 2 cylinder coupe, inside driven; one 24 h.p. 2 cylinder chassis, one 18 h.p. 2 cylinder runabout, latter model new this year. All friction drive. Exclusive feature: dustproof chain case.

Chadwick Engineering Works, Pottstown, Pa. Chadwick Great Six gasolene cars. One 60 h.p. 6 cylinder touring car, one 60 h.p. 6 cylinder racing runabout, one 6 cylinder chassis. New features, internal expanding clutch and magneto self-starting device. Exclusive feature: copper water jackets.

Dayton Motor Car Co., Dayton, O. Stoddard-Dayton gasolene cars. One 40-45 h.p. 4 cylinder touring car, one 40-45 h.p. 4 cylinder limousine, one 30-35 h.p. 4 cylinder touring car, one 40-45 h.p. 4 cylinder toy tonneau, one 25 h.p. 4 cylinder runabout, one 40-45 h.p. 4 cylinder chassis. New models have water jackets or steel instead of copper; 4 cam gears instead of 5; gear shift outside of frame. Exclusive feature: only difference between models is in size. Design identical throughout line.

De Dion Bouton Selling Branch, New York City. De Dion Bouton gasolene cars. Two 8 h.p. 1 cylinder runabouts, one 8 h.p. 1 cylinder taxicab, one 12 h.p. 4 cylinder landaulet, one 18 h.p. 4 cylinder limousine, one 1 cylinder chassis. Exclusive feature: transversal cardan shaft on rear axle.

Delahaye Import Co., New York City. Delahaye gasolene cars. One 35 h.p. 4 cylinder touring car, one 35 h.p. 4 cylinder runabout, one 12-14 h.p. 2 cylinder town car (shaft drive), one 12-14 h.p. 2 cylinder chassis, one 16-18 h.p. 4 cylinder runabout, one 35 h.p. 4 cylinder chassis. All chain-drive except town car. Exclusive feature: Delahaye demountable rim.

De Luxe Motor Car Co., Detroit, Mich. DeLuxe gasolene cars. One 4 cylinder touring car, one 4 cylinder limousine, one 4 cylinder close coupled tourabout—all 50-60 h.p.; one 4 cylinder chassis. Exclusive feature: rear axle construction.

Fiat Automobile Co., New York City. Fiat gasolene cars. One 40 h.p. 4 cylinder landaulet, chain drive; one 25 h.p. 4 cylinder runabout, shaft drive; one 18 h.p. 4 cylinder town car, shaft drive; one 12 h.p. 4 cylinder landaulet, shaft drive; one 12 h.p. chassis, shaft drive; one 18 h.p. 4 cylinder chassis, shaft drive; one 40 h.p. 4 cylinder chassis, chain drive; one 45 h.p. 6 cylinder chassis, chain drive; one 45 h.p. 4 cylinder chassis, chain drive. Five of the seven models are shaft driven. Also five of the seven models are now fitted with Bosch high tension magneto.

Ford Motor Co., Detroit, Mich. Ford gasolene cars. One 4 cylinder touring car, one 4 cylinder coupe, one 4 cylinder town car, one 4 cylinder roadster, one 4 cylinder taxicab—all 20 h.p. Roadster model entirely new design. Exclusive features: cylinders cast en bloc, control on left side, new clutch, magneto in fly wheel, vanadium steel construction.

Gaeth Automobile Co., Cleveland, O. Gaeth gasolene cars. One 35-40 h.p. 4 cylinder touring car, one 35-40 h.p. 4 cylinder tourabout, one 35-40 h.p. chassis. Exclusive features: "V" shaped folding wind shield, patent ratchet automatic self-finding gear-shift; contracting band clutch, make-and-break ignition.

Holsman Automobile Co., Chicago, Ill. Holsman gasolene motor buggies. One 26 h.p. 4 cylinder surrey, one 26 h.p. coupe, one 12½ h.p. 2 cylinder delivery wagon, 1,000 lbs. capacity. All friction-chain drive, air-cooled, high wheels. Exclusive features: direct transmission from engine shaft to rear wheels by friction chain; motor construction.

Hol-Tan Co., New York City. Lancia gasolene cars. One 25 h.p. 6 cylinder chassis, one 18 h.p. 4 cylinder chassis, one 18 h.p. touring car and 18 h.p. 4 cylinder Lancia "Lampo," Savannah racer; two 18 h.p. 4 cylinder landaulets.

Hotchkiss Import Co., New York City. Hotchkiss gasolene cars. One 65 h.p. 6 cylinder toy tonneau, one 45 h.p. 4 cylinder toy tonneau, one 16-20 h.p. 4 cylinder limousine.

Isotta Import Co., New York City Isotta-Fraschini gasolene cars. One 20 h.p. 6 cylinder town car landaulet, one 14-20 h.p. 4 cylinder limousine, one 40-45h .p. 4 cylinder limousine, one 18-24 h.p. 4 cylinder brougham, one 50-65 h.p. 4 cylinder tourabout, one 50-65 h.p. 4 cylinder L. I. Sweepstakes racer, and one 50-65 h.p. Briarcliff racer. New feature: shaft drive on 40-45 h.p. model.

Jackson Motor Co., Jackson, Mich. Jackson gasolene cars. One 40-45 h.p. 4 cyl-

inder touring car, one 35 h.p. 4 cylinder touring car, one 35 h.p. 4 cylinder tourabout, one 20 h.p. 2 cylinder tourabout with detachable baby tonneau, one 40-45 h.p. 4 cylinder chassis, one 35 h.p. 4 cylinder chassis. The 35 h.p. model new this year and has cylinders cast in pairs; other models individual cylinders. On 40-45 h.p. model, foot accelerators and low tension Splitdorf ignition, new details.

Lorraine-Dietrich Import Co., New York City. De Dietrich and Mercedes gasolene cars. De Dietrich—One 40-50 h.p. 4 cylinder touring car, one 40-50 h.p. 4 cylinder roadster, one 40-50 h.p. 4 cylinder chassis, one 20-30 limousine. Mercedes—One 35 h.p. 4 cylinder folding limousine.

Lane Motor Vehicle Co., Poughkeepsie, N. Y. Lane steam cars. One 30 h.p. roadster, one 20 h.p. touring car, one 20 h.p. runabout.

Marion Motor Car Co., Indianapolis, Ind. Marion gasolene cars. One 32-35 4 cylinder toy tonneau, one 32-35 h.p. chassis. Selective instead of progressive type change gear; magneto and dry cells in place of accumulator. Exclusive feature: axle mounted change gear.

Maxwell-Briscoe Motor Co., Tarrytown, N. Y. Maxwell gasolene cars. One 30 h.p. 4 cylinder limousine, one 30 h.p. 4 cylinder touring car, one 30 h. p. 4 cylinder roadster, one 20 h.p. 2 cylinder touring car, one 14 h.p. 2 cylinder runabout, one 10 h.p. 2 cylinder runabout, one 30 h.p. 4 cylinder chassis, one 10 h.p. 2 cylinder chassis, one 20 h.p. 2 cylinder delivery wagon and one 3 cylinder 9-passenger drag "built by J. W. Wilkins in 1876." Magneto and full elliptic springs on all 1909 models except 10 h.p.; latter new model this year.

McIntyre Company, W. H., successors to Kiblinger Co., Auburn, Ind. McIntrye gasolene auto buggies. One 16 h.p. 2 cylinder opposed runabout, one 12 h.p. 2 cylinder runabout, one 16 h.p. 2 cylinder surrey, one 16 h.p. 2 cylinder delivery wagon, 1,000 lbs. capacity; one 28 h.p. 4 cylinder vertical. All models air-cooled and 12 and 16 h.p. have offset cylinders. Entire line new models this year.

Midland Motor Car Co., Moline, Ill. Midland gasolene cars. One 30-35 h.p. 4 cylinder touring car. Rear axle full floating instead of semi-floating, magneto equipment.

Mitchell Motor Car Co., Racine, Wis. Mitchell gasolene cars. One 40 h.p. 4 cylinder touring car, one 30 h.p. 4 cylinder runabout, one 20 h.p. runabout, one 20 h.p. 4 cylinder roadster. Thirty and 40 h.p. models now have magneto; 40 h.p. has full floating rear axle.

Moline Automobile Co., East Moline, Ill. Moline gasolene cars. One 35-40 h.p. 4 cylinder baby tonneau, one 24 h.p. 4 cylinder baby tonneau. Double ignition system on 30-35 model, new cork insert clutch, shaft or double chain drive on 24 h.p., former giving 14 inches clearance.

Moon Motor Car Co., St. Louis, Mo. Moon gasolene cars. One 30 h.p. 4 cylinder landaulet, one 30 h.p. baby tonneau, one 30 h.p. roadster. Exclusive feature: new magneto self-starting device.

Mora Motor Car Co., Newark, N. J. Mora gasolene cars. One 42-50 h.p. 6 cylinder touring car, one 42-50 h.p. 6 cylinder "Racytype," one 24-28 4 cylinder roadster, one 24-28 4 cylinder "Racytype," one 24-28 h.p. 4 cylinder limousine, one 24-28 h.p. chassis. Selective instead of progressive change gear, frame pressed steel instead of armored wood. The 24-28 h.p. model new.

National Motor Vehicle Co., Indianapolis, Ind. National gasolene cars. One 45 h.p. 6 cylinder touring car, one 40 h.p. 4 cylinder touring car, one 30 h.p. 4 cylinder touring car. The latter model new. New crank case oiler and increased tire sizes on old models. Exclusive features: double ignition, ball bearing crank shaft, floating rear axle.

Nordyke & Marmon, Indianapolis, Ind. Marmon gasolene cars. One 50 h.p. 4 cylinder touring car, one 32 h.p. 4 cylinder touring car, one 32 h.p. 4 cylinder roadster, one 32 h.p. coupe, one 32 h.p. chassis. All motors water cooled, special double internal expanding brake, pressed steel brake drums, Bosch ignition, one set plugs. Exclusive feature: rear axle, design, easily removable differential and transmission, axle mounted change gear group.

Oakland Motor Car Co., Pontiac, Mich. Oakland gasolene cars. One 40 h.p. 4 cylinder touring car, one 40 h.p. 4 cylinder roadster, one 40 h.p. 4 cylinder runabout, one 20 h.p. 2 cylinder touring car, one 20 h.p. 2 cylinder roadster, one 20 h.p. 2 cylinder landaulet. The 40 h.p. models new. New pressure feed lubrication, and clutch on 20 h.p. car. Exclusive feature: change gear control and engine balancing system.

Overland Automobile Co., Indianapolis, Ind. Overland gasolene cars. One 45 h.p. 6 cylinder baby tonneau, one 30 h.p. 4 cylinder runabout, one 30 h.p. 4 cylinder touring car, one 30 h.p. 4 cylinder inside drive coupe. High tension magneto used instead of accumulator; selective or planetary transmission optional on 4 cylinder cars; 6 cylinder model new this year. Exclusive feature: pedal control only on smaller model.

Panhard & Levassor, New York City. Panhard gasolene cars. One 65-80 h.p. 6 cylinder tourabout, one 35-45 h.p. 4 cylinder limousine, one 18-30 h.p. 4 cylinder limousine, one 18-30 h.p. 4 cylinder landaulet, one 15-20 h.p. 4 cylinder landaulet.

Pennsylvania Auto Motor Co., Bryn Mawr, Pa. Pennsylvania gasolene cars. One 6 cylinder 75 h.p. baby tonneau, one 4 cylinder 25 h.p. landaulet, two 4 cylinder touring cars, one 25, one 50 h.p.; one 50 h.p. chassis. Six cylinder model new.

Premier Motor Car Co., Indianapolis, Ind. Premier Gasolene cars. One 45 h.p. 6 cylinder touring car, one 30 h.p. 4 cylinder touring car, Premier "Century" roadster, one 30 h.p. 4 cylinder chassis. New demountable clutch, three-quarter elliptic springs, larger wheel bases.

Regal Motor Car Co., Detroit, Mich. Regal gasolene cars. One 30 h.p. 4 cylinder touring car, one 30 h.p. 4 cylinder runabout, one 30 h.p. 4 cylinder chassis. Horsepower increased from 25 to 30; transmission selective; new double ignition system.

Renault Freres Agency, New York City. Renault gasolene cars. One 35-45 h.p. 4 cylinder roadster, one 30 h.p. 4 cylinder special roadster, one 20-30 4 cylinder landaulet, one 10-14 h.p. 4 cylinder town car, one 8-10 h.p. 2 cylinder taxicab, one 8-10 h.p. 2 cylinder voiturette, one 35-45 h.p. 4 cylinder chassis. The 20-30 and 35-45 models are equipped with special self-starting device.

Reo Motor Car Co., Lansing, Mich. Reo gasolene cars. Two 22 h.p. 2 cylinder touring cars, two 12 h.p. 1 cylinder runabouts, one 2 h.p. 2 cylinder runabout, one 22 h.p. 2 cylinder chassis. Drop forged front axle new design; radiator arranged so as to fill without lifting hood.

Simplex Motor Car Co., Mishawaka, Wis. American Simplex (2-cycle) gasolene cars. Two 50 h.p. 4 cylinder touring cars, one 50 h.p. 4 cylinder chassis. Exclusive features, engine design, axle mounted change gear, extended use of ball bearings.

Welch Motor Car Co., Pontiac and Detroit, Mich. Welch gasolene cars. One 75 h.p. 6 cylinder baby tonneau, victoria top, one 75 h.p. 6 cylinder limousine, two 50 h.p. 4 cylinder touring cars. The 6 cylinder model is new. New transmission system.

York Motor Car Co., York, Pa. Pullman gasolene cars. One 40 h.p. 4 cylinder touring car, one 40 h.p. 4 cylinder roadster, one 30 h.p. 4 cylinder touring car, one 20 h.p. baby tonneau, one 20 h.p. 4 cylinder runabout. The 40 h.p. models have full floating roller bearing rear axle; new oiler enabling regulation of height of splash system; all except 20 h.p. have Bosch magneto.

Allen-Kingston Motor Car Co., New York City. Allen-Kingston gasolene cars. One 48 h.p. 4 cylinder chassis. Entirely new model this year.

Benner Motor Car Co., New York City. Benner gasolene cars. One 25-30 h.p. 6 cylinder runabout, one 25-30 h.p. 6 cylinder chassis.

Black Mfg. Co., Chicago, Ill. Black gasolene motor buggies. One 20 h.p. 2 cylinder surrey, one 20 h.p. 2 cylinder roadster, one 14 h.p. 2 cylinder buggy one 40 h.p. 4 cylinder roadster, one 14 h.p. 2 cylinder chassis. Small cars now have off-set cylinders instead of direct opposed; mechanical oiler in place of pressure-feed, magneto on large model. Exclusive feature, new 40 h.p. model highest powered motor buggy on the market.

Bristol Engineering Corporation, Bristol, Conn. Bristol gasolene cars. One 18-20 h.p. 4 cylinder landaulet, one 18-20 h.p. 4 cylinder chassis. First time shown. Exclusive feature: interchangeable design of power and transmission units.

Cameron Motor Co., Beverly, Mass., and New London, Conn. Cameron air-cooled gasolene cars. One 30-36 h.p. 6 cylinder baby tonneau, one 20-24 h.p. 4 cylinder chassis, two 20-24 h.p. 4 cylinder runabouts, one 20-24 h.p. 4 cylinder touring car. Steel frame now used instead of wood; tubular axles, Remy low-tension magneto; force feed oiler with geared pump. Exclusive feature: axle mounted change gear.

Cleveland Auto Cab Co., Geneva, O. Ewing gasolene cabs. One 20 h.p. 4 cylinder taxicab. First time shown.

Coates-Goshen Automobile Co., Goshen, N. Y. Coates-Goshen gasolene cars. One 32 h.p. 4 cylinder runabout, one 32 h.p. 4 cylinder landaulet. First time shown. Exclusive features: use of ball and socket joints on all connections; special torque group.

Crawford Automobile Co., Hagerstown, Md. Crawford gasolene cars. One 20-25 h.p. 4 cylinder touring car, one 40 h.p. 4 cylinder touring car. 20-25 h.p. model is new this year. Shaft drive.

Gyroscope Automobile Co., New York City. Gyroscope gasolene cars.. One 18 h.p. 2 cylinder roadster. New roller bearing crank shaft on 1909 model. Exclusive feature: vertical crankshaft on opposed motor, friction transmission, shaft drive.

Inter-State Automobile Co., Muncie, Ind. Inter-State gasolene cars. One 35 h.p. 4 cylinder touring car, one 35 h.p. 4 cylinder baby tonneau, one 35 h.p. 4 cylinder tonneau. First time shown. Exclusive feature: change gear and rear axle design.

Kissel Motor Car Co., Hartford, Wis. Kisselkar gasolene cars. One 60 h.p. 6 cylinder touring car, one 40 h.p. 4 cylinder touring car, one 30 h.p. 4 cylinder touring

Digitized by Google

car, one 30 h.p. 4 cylinder chassis. Double ignition applied to all 1909 models.

The McCue Co., Hartford, Conn. McCue-Hartford gasolene cars. One 30 h.p. 4 cylinder roadster, one 30 h.p. 4 cylinder touring car. First time shown.

Middleby Automobile Co., Reading Pa. Middleby gasolene cars. One 25 h.p. 4 cylinder roadster, one 25 h.p. 4 cylinder runabout—both air-cooled. First time shown.

Omar Motor Co., Newark, N. J. Browniekar gasolene cars (jevenile). Three 3 h.p. 1 cylinder runabouts. First time shown.

Reliable Dayton Motor Car Co., Chicago, Ill. Reliable Dayton gasolene motor buggies. One 20 h.p. 2 cylinder surrey, one 15 h.p. 2 cylinder runabout, one 15 h.p. 2 cylinder chassis. The 20 h.p. model is new this year. Exclusive feature: sliding change gear design.

Schacht Mfg. Co., Cincinnati, O. Schacht gasolene motor buggies. One 20 h.p. 2 cylinder high wheel runabout, one 20 h.p. 2 cylinder low wheel chassis. The 1909 models have increased power. Exclusive feature: friction change gear design.

Sharp-Arrow Automobile Co., Trenton, N. J. Sharp-Arrow gasolene cars. One 40 h.p. 4 cylinder chassis. First time shown. Speedwell Motor Car Co., Dayton, O. Speedwell gasolene cars. One 40 h.p. 4 cylinder toy tonneau, one 40 h.p. 4 cylinder chassis. The 1909 models have full floating pressed steel roller bearing rear axles and Bosch magneto. Exclusive feature: method of assembling roller bearings in change gear.

Sultan Motor Co., New York City. Sultan gasolene taxicabs. One 12 h.p. 4 cylinder taxicab. First time shown.

Wayne Works, Richmond, Ind. Richmond gasolene cars. One 22½ h.p. 4 cylinder touring car, one 22½ h.p. 4 cylinder roadster, one 22½ h.p. 4 cylinder runabout. The 1909 models are larger and lighter than formerly.

Anderson Carriage Mfg. Co., Anderson, Ind. Anderson motor buggies. Two 12 h.p. 2 cylinder air-cooled motor buggies, one 12 h.p. 2 cylinder demonstration chassis.

Commercial Vehicles.

American Motor Truck Co., Lockport, N. Y. American gasolene motor truck. One 55 h.p. 4 cylinder 3 ton truck.

Commercial Truck Co. of America, Philadelphia, Pa. Commercial electric trucks. One 1,000-lb. truck, 40 cells, battery; one 2,000-lb. delivery wagon, both entirely new models. Exclusive features: spiral gear drive, enclosed and running in oil; special control from steering-post only, instead of by side levers.

Grabowsky Power Wagon Co., Detroit, Mich. Grabowsky gasolene trucks. One 30-35 h.p. 2 cylinder opposed, 12 passenger palace car, one 1 ton 30-35 h.p. 2 cylinder express wagon, one 30-35 h.p. 2 cylinder 2-ton truck, one 30-35 h.p. 2 cylinder chassis. First time shown. The 1909 models have double ignition magneto and storage battery. Exclusive features: removable power plant; thermo-siphon cooling system with condensing chamber; hardened steel bushings in 28 places where removals are frequently necessary.

Gramm-Logan Motor Car Co., Bowling Green, O. Gramm-Logan gasolene trucks. One 45 h.p. 4 cylinder 3-ton truck (water cooled), one 25 h.p. 4 cylinder 1,500-lb. delivery wagon (air cooled). First time shown. The 1909 models have new disc clutch of original design; ball and socket joints at each end of strut rods. Exclusive feature: sand box in center of chassis, controlled from seat.

Hart-Kraft Motor Co., York, Pa. Hart-Kraft commercial power wagons. Two 14 h.p. 2 cylinder opposed delivery wagons. First time shown. Exclusive feature: method of detaching complete power unit.

Lansden Co., The, Newark, N. J. Lansden electric commercial vehicles. One 1-ton express wagon, one 2-ton express wagon, one 1,500-lb. delivery wagon, one 2-ton industrial platform truck. Exclusive feature: design of latter.

Mack Bros. Motor Car Co., Allentown, Pa. Manhattan gasolene trucks. One 50 h.p. 4 cylinder, 5-ton truck; one 50 h.p. 4 cylinder 16-passenger bus.

Otto, Albert T., New York City. Saurer gasolene commercial trucks. One 30-40 h.p. 4 cylinder, 5 ton truck. First time shown in New York. Exclusive features: automatic motor brake, pneumatic starting device and double jet carburetter..

Pittsburg Motor Vehicle Co., Pittsburg, Pa. Pittsburg electric commercial vehicles. One 1-ton delivery wagon, 22 cells; one 1-ton delivery wagon, 42 cells.

Rapid Motor Vehicle Co., Pontiac, Mich. Rapid gasolene trucks. One 24 h.p. Glidden tour truck, one 30 h.p. 20-passenger tourist, one 30 h.p. 12-passenger "Pullman," one 24 h.p. 1-ton delivery wagon, one 24 h.p. ambulance, one 30 h.p. stake wagon, one 30 h.p. fire patrol, one 60 h.p. 5-ton truck, one 30 h.p. chassis—all 2 cylinder except 60 h.p. model, which is 4 cylinder. Several models new this year.

Reliance Motor Truck Co., Owosso, Mich. Reliance gasolene trucks. One 45 h.p. 3 cylinder, 2-cycle, 3-4 ton truck; one 30 h.p. 2 cylinder, 2-cycle, 2-ton truck; one 45 h.p. 3 cylinder, 2-cycle, 3-4 ton chassis. Exclusive feature: flexibility of power plant construction and interchangeability.

Summary of Accessories Exhibits

Ajax-Grieb Rubber Co., New York City—Ajax tires.

American Ball Bearing Co., Cleveland, O.—Ball bearings and axle equipments.

American Electrical Novelty Mfg. Co.,—Ever Ready Batteries, lamps and tire specialties.

Atwater-Kent Mfg. Works, Philadelphia, Pa.—Igniters and timers.

Atwood-Castle Co., Amesbury, Mass—Lamps.

Autocoil Co., Jersey City, N. J.—Coils.

Auto Improvement Co., New York City—Self starting devices and motor specialties.

Badger Brass Mfg. Co., New York City and Kenosha, Wis.—Solar lamps and acetylene generators.

Baldwin Chain and Mfg. Co., Worcester, Mass.—Baldwin chains, sprockets and steeringgear.

Bowser & Co., S. F., Ft. Wayne, Ind.—Tanks, measuring pumps and gasolene storage systems.

Briscoe Mfg. Co., Detroit, Mich.—Radiators and fittings.

Brown-Lipe Gear Co., Syracuse, N. Y.—Transmissions, differential and steering gears.

Byrne, Kingston & Co., Kokomo, Ind.—Kingston carburetters, mufflers and pumps.

Coes Wrench Co., Worcester, Mass.—Adjustable wrenches.

Columbia Nut and Bolt Co., Bridgeport, Conn.—Lock nuts.

Connecticut Telephone and Electric Co., Meriden, Conn.—Spark coils, switches and ignition specialties.

Consolidated Rubber Tire Co., New York City—Kelly-Springfield tires.

Continental Caoutchouc Co., New York City—Continental tires and demountable rims.

Cowles & Co., C., New Haven, Conn.—Specialties.

Cramp & Sons Ship & Engine Co., Wm., Philadelphia, Pa.—Bronze castings and automobile parts.

Diamond Chain and Mfg. Co., Indianapolis, Ind.—Chains and sprockets.

Diamond Rubber Co., Akron, O.—Diamond tires.

Dixon Crucible Co., Joseph, Jersey City, N. J.—Graphite and lubricants.

Dow Tire Co., New York City—Dow non-deflation tubes.

Edmunds & Jones Mfg. Co., Detroit, Mich.—Lamps.

Electric Storage Battery Co., Philadelphia, Pa.—Accumulators.

Empire Automobile Tire Co., Trenton, N. J.—Empire tires.

Firestone Tire & Rubber Co., Akron, O.—Firestone pneumatic and solid tires.

Fisk Rubber Co., Chicopee Falls, Mass.—Fisk tires and demountable rims.

G & J Tire Co., Indianapolis, Ind—G & J tires.

Gabriel Horn Mfg. Co., Cleveland, O.—Gabriel exhaust horns and shock absorbers.

Gemmer Mfg. Co., Detroit, Mich.—Steering gears and parts.

Gilbert Mfg. Co., New Haven, Conn.—Tires, jackets, lamps, covers, and rubber cloth specialties.

Goodrich Co., B. F., Akron, O.—Goodrich clinches tires.

Goodyear Tire & Rubber Co., Akron, O.—Goodyear tires and compressed air inflaters.

Gray & Davis, Amesbury, Mass.—Lamps.

Gray-Hawley Mfg. Co., Detroit, Mich.—Chime whistles and muffler cut-outs.

Ham Mfg. Co., C. T., Rochester, N. Y.—Lamps.

Harris Oil Co., A. W., Providence, R. I.—Lubricants.

Hartford Rubber Works Co., Hartford, Conn.—Hartford tires.

Hartford Suspension Co., Jersey City, N. J.—Truffault-Hartford shock absorbers.

Heinze Electric Co., Lowell, Mass.—Coils and ignition equipment.

Herz — Co., New York City—Timers, plugs and ignition specialties.

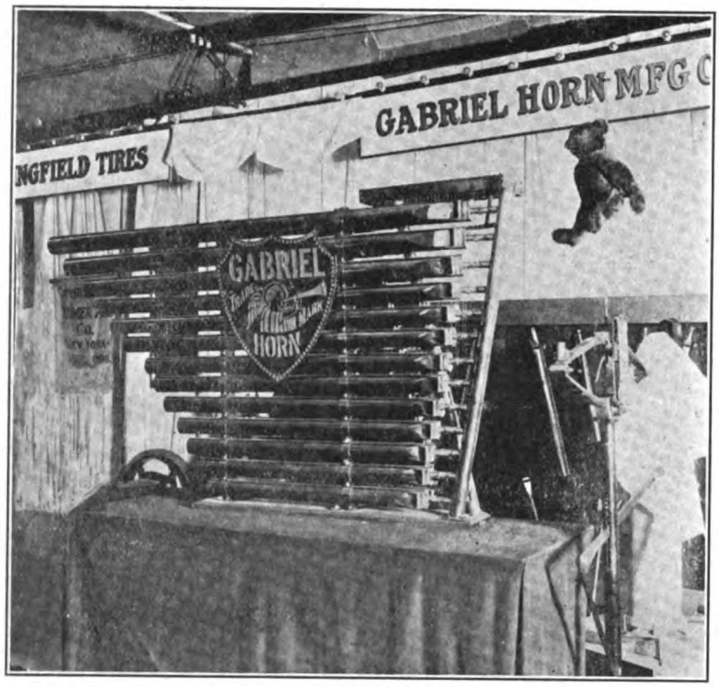
Hess-Bright Mfg. Co., Philadelphia, Pa.—Annular ball bearings and magnetos.

Hoffecker Co., The, Boston, Mass.—Speed indicators.

Hyatt Roller Bearing Co., Harrison, N. J.—Roller bearings.

Jones Speedometer, New York City—Speedometers, annunciators, odometers and specialties.

Kokomo Electric Co., Kokomo, Ind.—Kingston spark plugs, coils and timers.



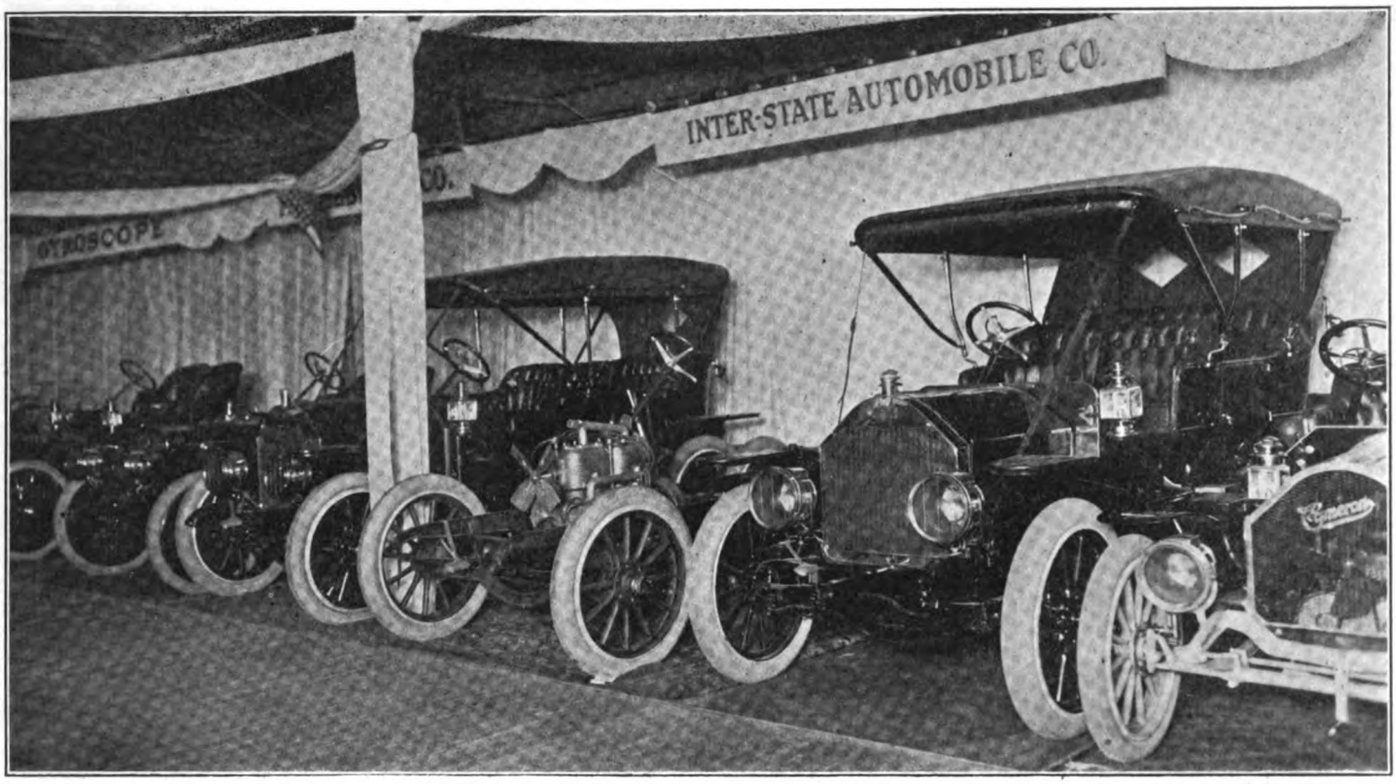
Leather Tire Goods Co., Newton Upper Falls, Mass.—Woodworth non-skid covers and chain grips.

Light Mfg. & Foundry Co., Pottstown, Pa.—Aluminum parts and castings.

McCord Mfg. Co., Chicago, Ill.—Radiators.

Mezger, C. A., New York City—"Soot-proof" spark plugs and automatic wind shields.

Digitized by Google



GABRIEL HORN EXHIBIT

HARTFORD SUSPENSION EXHIBIT

Michelin Tire Co., Milltown, N. J.—Michelin tires.
Miller, Charles E., New York City—Brampton chains, supplies and accessories.
Morgan & Wright, Detroit, Mich.—Morgan &Wright tires.
Mosler & Co., A. R., New York City—Spark plugs, timers, "Isti" rear end signals.
Motsinger Device Mfg. Co., Pendleton, Ind.—Auto sparkers, switchboards and mufflers.
Motz Clincher Tire and Rubber Co., Akron, O.—Clincher and solid tires.

WILKES-BARRE CAPTURES HONORS

Quaker City Endurance Run a Strenuous Test of Men and Machines—Sensational Accidents but no Disaster.

To one of the class of men in which heroes are as plentiful as swallows around a disused chimney fell the honor of winning what was, perhaps, the most exacting endurance run ever held in America—namely, the two days' endurance contest from Philadelphia to Wilkes-Barre and return on Friday and Saturday last, January 1st and 2nd, promoted by the Quaker City Motor Club. By vocation William Miller is a Wilkes-Barre fireman and perhaps his long experience in climbing up and down treacherous, ice-coated ladders had something to do with his proficiency in guiding his car car over a two days' run of slippery mountain roads without a single mishap. Not only did Wilkes-Barre people have just cause for jubilation because Miller and two other local drivers—Ross Anderson and John Dietrich—survived the test with honor to themselves but because the respective cars they drove were manufactured in Wilkes-Barre. In the final placing of the survivors Miller, Anderson and Dietrich, driving Matheson cars, respectively were first, third and fourth.

Every driver that finished the run was more or less of a hero and C. S. Carris, who brought a Franklin through the run with but 22 points penalization, is in the same class with Miller. Everyone who went through the run agrees that it is a tribute to the solidity of American construction that any of the cars were able to get through without greater penalization than was accorded to them.

The case of Ray McNamara, who drove a Premier car through both days with no observers' penalties and was disqualified because it was stated that the car did not carry its full quota of passengers up Giant's Despair was one to excite sympathy. It was announced that the Premier car was the only one to emerge from the Technical Committee's hands without penalization, but that it had been disqualified for the reason stated. It was reported that some of the passengers had been afraid to remain in the car during the tortuous ascent of the Wilkes-Barre mountain, and this resulted in its disqualification. Considerable feeling has developed in Philadelphia over the matter.

The nature of the findings of the technical committee was not divulged, but it was learned that most of the penalizations were for loose nuts and other trivial things of the sort to be expected after a contest of so strenuous a nature. Miller of the Matheson had a perfect road score but was assessed 11 points for trivialities, and the technical committee put 5 points on the score of the Franklin which, with the 17 points incurred previously, set down its score 22 points from the perfect goal. The other two Mathesons, driven by Anderson and Dietrich, had perfect road scores but were penalized 23 and 37 points, respectively, by the committee.

Of the seven runabouts that started only two finished and neither finished with a perfect score. George Brooks, Peerless, won the cup by having the lowest penalization, 270 points, as against the 528 points charged to W. L. Longstreth. On the whole it was a memorable contest with which to usher in the new year.

TYPICAL CROWD GREETS W. C. LONGSTRETH, MAXWELL, AT WILKES-BARRE

First Day—Friday.

It is not likely that any of the 31 drivers who started from Philadelphia Friday morning will soon forget that exacting first day's run over the ice-clad roads from the Quaker City to Wilkes-Barre. Without doubt the test put upon the contesting machines was one of the most severe ever put upon cars in a similar contest promoted by the Quaker City Motor Club. The route lay over ground glazed with ice and abounding in hills full of treacherous twists and turns. Accidents were frequent, but with no serious results, although several cars were temporarily put out of commission. A curious fact about the mishaps was that the most serious ones took place between Philadelphia and Stroudsburg, where the going was easiest. From Stroudsburg to Wilkes-Barre was by far the hardest part

Digitized by Google

of the journey and the roads were covered with ice, overlaid by a treacherous blanket of snow. That serious accidents did not occur on some of these mountain twists was by kind dispensation of providence and the magnificent manner in which the cars were handled.

WILLIAM MILLER DRIVING THE WINNING MATHESON ON GIANT'S DESPAIR

Thirty-one cars got away from the Hotel Walton, Bert Maucher, in the ill-fated Peerless, setting the pace, with two minutes headway between each of the following cars. Class A, which was for touring cars, and for the permanent possession of the MacDonald and Campbell cup, drew 24 starters. In Class B, for runabouts and roadsters, there were seven starters. The prize in this latter class is a loving cup donated by the club.

As stated, the first day's run was from Philadelphia to Wilkes-Barre, a distance of 154 miles. Controls were established at Sellersville, Allentown and Stroudsburg, the time limit for the entire distance being 7 hours 40 minutes 52 seconds. When the cars finished at the Diamond City it was announced that only 12 touring cars and two roadsters had arrived with perfect time scores, the technical committee not having rendered a report. The cars thus honored for the first day's run were as follows:

Class A—William Crawford, 30 horsepower Cadillac; Ed. Burnshaw, 30 Cadillac; John Dietrich, 45 Matheson; William Miller, 45 Matheson; W. Bickle, 40 Stoddard-Dayton; E. C. Folberth, 40 Oldsmobile; H. B. Tuttle, 30 Stoddard-Dayton; Ross Anderson, 50 Matheson; C. Carris, 28 Franklin; Ray McNamara, 30 Premier; O. W. Hoffman, 40 Stearns, and F. W. Darnstadt, 34 Rambler.

Class B—W. C. Longstretch, 24 Maxwell, and George Brooks, 30 Peerless.

The run to Sellersville, the first control, was uneventful. The day broke clear and cold and the roads from Philadelphia to the first checking station were in perfect condition. Toll gates were passed without stopping as the Quaker City Motor Club previously had paid the tolls of all the competing cars, an example which might well be copied by other organizations promoting endurance runs through toll road abounding communities.

One of the first accidents happened to Dan Webster in the Oldmobile roadster. About five miles from Allentown the car caught in the car tracks and skidded around like a whirling dervish. The occupants were scattered in all directions and Webster found himself sitting alongside a telegraph pole holding a piece of the steering wheel in both hands.

Bert Maucher, who was one of the remaining unfortunates, told of a thrilling escape. His car was making a sharp curve near Easton when it skidded on the icy roads and dropped into a ditch, overturning and throwing out all the occupants except Lobell, the mechanic. He was pinned under the steering wheel but was saved from probably serious injury by James Davidson, who was one of the occupants. Although Davidson had been severely bruised about the legs he had presence of mind to lift the front of the car from Lobel and the latter was able to extricate himself. Maucher was injured about the shoulders and S. R. Stankowitz also was bruised.

Another narrow escape was that of H. C. Vetterlein, driver of the Stoddard-Dayton roadster; Jack Harkins, the mechanic, and an observer. The car skidded off the road into a fence, but all the occupants jumped to safety. Frank Hardhart, Jr., ran his Elmore into a porch at Bethlehem. The support was knocked from it and the porch roof fell, but Hardhart and his companions got out of the car in time. George Mauser, in a Franklin, turned turtle near Easton, but he managed to get the car on the road again and finish.

After smashing a wheel near Easton in an effort to avoid hitting a pedestrian, A. J Depew, Winton, unfortunately broke his crank shaft, but despite this set back, somehow managed to work his way to the finish. Thomas Wilkie skidded into a team near Bethelehem and put his Buick car out of the running, and Frank Yerger, Studebaker, was reduced to a state of desperation because of tire trouble. He finished in Wilkes-Barre, however.

The tortuous descent down Giant's Despair, just outside Wilkes-Barre, a mountain road that has become famous because of the climb held upon it every Decoration Day, was attended with several incidents. John Dietrich and William Miller, both in Mathesons, drove the first cars to arrive and then followed William Crawford in a Cadillac. All the cars see-sawed down Giant's Despair, but a thrilling moment was

C. CARRIS, FRANKLIN, GETS THE GLAD HAND AT PHILADELPHIA

Digitized by Google

that when Fred Darnstadt, Rambler, reached the most tortuous turn in the road. The car commenced to slide sidewise and turned almost completely around before it practically came to a standstill in the middle of the road. Berger, in an Oldsmobile, was following closely, and he saw that his only chance to avoid a collision lay in driving his car straight into a ditch. Before trying to extricate their car Berger and his crew ran back to warn the approaching cars and thus avoided what doubtless would have resulted in a conglomerated mass of twisted steel and broken bones, had the following cars come down. The Oldsmobile was lifted out of the ditch and further danger at this point was avoided.

Second Day—Saturday.

According to a prominent member of the Quaker City Motor Club—name withheld because his reputation for veracity until now has been unquestioned—Archimedes once ventured the opinion that if he were allowed to take his now historical crowbar and pry Wilkes-Barre mountain, otherwise known as Giant's Despair, off the map into space, the world would revolve upon its axis once every ten hours, where now 24 hours are required for the cycle. The reason is that Giant's Despair presents such wind resistance that the progress of the world is accordingly retarded in its navigations through space. And all the enduranc-ers who survived the second day's run of the Quaker City Motor Club, are inclined to agree with the member who ventured this opinion.

To climb Giant's Despair under ordinary conditions one has to take a running start some fifteen miles back in the Pennsylvania landscape and then rush around its tortuous curves with the throttle wide open. Sometimes you get up and sometimes you don't—more frequently you don't. Even when the roads are hard and firm it is more or less like trying to walk up the backstretch of a loop the loop. But when the roads are covered with ice and snow—when a skid on one of the doubled-up-elbow turns is certain catastrophe, the task of the motorist is rendered many times more difficult. That was the first task of the Philadelphia motorists on the return trip to Philadelphia—to climb 6,000 feet of ice-covered mountain twists and turns, portions of which attain a gradient of 30 per cent. It is little wonder that some clean scores were dropped at the very start off.

The day's stories of accidents had their inception mostly on Giant's Despair. The trouble started when the first car got half way up, skidded, turned half way around and then blocked the road. The other cars following were enforced to halt and in a short time six or seven were stalled on the narrow road. After a deal of manouvering most of the cars got around the obstruction but F. G. Folberth in an Oldsmobile refused to proceed until the cause of the obstruction was removed. On this ground he made a claim of 44 minutes to the technical committee, because he was held up this length of time. Other complaints were to the effect that the official confetti car, on account of its heavy load had been obliged to circumvent the mountain, a distance of about 15 miles, and several of the cars were held up because the drivers were at loss to ascertain what roads to take when divers routes were presented for their choice.

On the whole the roads were about on a par with those that confronted the endurancers on the first day's run from Philadelphia. The worst part of the itinerary was after leaving Bear Creek to White Haven and to Freeland. Some of the grades were exceptionally steep while the road was narrow correspondingly. The hairbreadth escapes and minor accidents that happened on roads such as these never will be reported, as each mile from Wilkes-Barre to Reading was fraught with continual danger.

The day's controls were located at Hazleton, 36.9 miles from Wilkes-Barre; Hamburg, 71.9 miles; Reading, 88.1 miles; Pottstown, 104.8 miles; Norristown, 104.8 miles, and the finish in Philadelphia. Because of the numerous controls and the icy roads over which a schedule of 20 miles an hour had to be maintained many cars lost points. It was not the fault of the cars.

The accident to the Peerless car was a peculiar one. On one side of the road between Bethlehem and Hecktown was a deep ditch, coated with thin ice. As Maucher came around the curve the car skidded and scraped the edge of the ditch. Had the ground been solid nothing would have come of it, but one wheel went through and broke, the machine turning over completely. Fortunately none of the occupants was injured and they lifted the car back to its original position. The engine was still running and another Peerless not in the run came along just as Maucher ruefully gazed at the damaged wheel. The driver of the non-contesting car kindly offered one of his wheels, but unfortunately it was of a different model and after several attempts Maucher reluctantly allowed himself to be towed back to town.

It was a sorry looking lot of motorists that arrived in Philadelphia from 2 o'clock in the afternoon until after prayer meeting time. All the cars showed effects of the hard run and the occupants looked sleepless, careworn and cold-pinched. Drivers, mechanics and observers were numbed by the cold and exposure of the nipping frost and biting winds on the mountain roads. At a late hour 21 cars had finished and the technical committee took their magnifying glasses, pencils and paper and began their deadly work.

FORT FAVORS MORE LIBERAL LAW

New Jersey Executive to Recommend Changes in Automobile Act—Newark Board of Trade Enlightens Him.

That Governor Fort, in his forthcoming annual message to the New Jersey Legislature, will recommend some important amendments to the automobile law of that State is assured as a result of his conference, on the 30th ult., with a special committee representing the Newark Board of Trade. The matter was placed before the Governor in a very strong light by Clarence H. Bissell, chairman of the committee, who in asking the Executive's assistance in bringing about changes in the law that would be fair to owners of machines as well as to the public at large, said in part:

"The action of the board was brought about by the boycott of New Jersey made products entering into the construction of automobiles threatened by the automobile manufacturers located in other States. The Board of Trade was informed that the sale of automobile parts by manufacturers located in the city of Newark alone, last year, exceeded the sum of $8,000,000, and throughout the State would probably be several times this amount. We are informed that the total amount of money received from licenses and registrations of automobiles for the eleven months from January 1 to December 1, 1908, was $152,128.49.

"While $150,000 is a large sum of money to be derived from this source it is, in our judgment, a small amount when compared to the loss which the manufacturers and other business interests affected will suffer if the present law is continued in force without modification.

"The two features in the present law which are causing the antagonism of non-residents and automobile manufacturers, are, first, the clause which requires non-residents to be personally registered before entering the State, and second, the grafting country justices. Supplementing the resolutions, and by way of further explanation, the existing statute in our opinion, which compels a tourist to take out a license before he can enter the boundaries of the State violates the law of good-will, fair play and neighborly State reciprocity. We feel that the tourist should be allowed from five to ten days' use of the State roads without being compelled to register.

"In making this recommendation we feel that the revenue derived by the hotels, garages and others interested in this transient trade is more than a satisfactory offset to the damage to our roads occasioned by these visitors. Speed traps for private gain should be abolished. This refers to the maintenance of traps by country justices and constables, timing an automobile over a short course, the course often being incorrectly measured, and the arrest made not to conserve justice, but to collect the fee which these men have a legal right to extort."

Governor Fort expressed surprise at the magnitude of Newark's trade interest in automobiles, as stated by the committee. He agreed with the proposition of granting certain tourist privileges. As to "speed traps," he expressed disapproval of them. The Governor stated that already he had talked with Governor Hughes, of New York, about the subject of interstate comity of licenses, and if possible would have like talks with the executives of Massachusetts, and other States.

Whatever recommendations the Governor may make to the legislature will be strongly supported by petitions from other parts of the State. The Atlantic City Board of Trade took action on the 30th ult., to secure the presentation to the legislature of a resolution favoring an amendment conferring tourist privileges on non-residents.

To Define "Borrowing" as Larceny.

Whether or not the unauthorized use of a motor vehicle by an employe of the owner constitutes the crime of larceny is a question upon which the Automobile Club of America aims to get a decision from the higher courts. To that end, on the 30th ult., it was instrumental in securing a certificate of reasonable doubt in the case of Richard P. Cooke, whom the Court of General Sessions had convicted of petit larceny and sentenced to the penitentiary for nine months.

Cooke is a chauffeur formerly employed by the New York Taxicab Co., and lives in Philadelphia, for which city he had started with one of the company's cabs when he was arrested. At his trial he pleaded that he had not intended to steal the vehicle, but was taking it to Philadelphia to give his mother, sister and sweetheart a ride. In charging the jury, Judge Malone said:

"The chauffeur takes the motor car out at night without his employer's permission and uses up the motive power and lubricating fluids and wears out the tires. Isn't that larceny? And if the use and wear and tear is not larceny, isn't it high time that it was so defined legally? If you believe the owner of this machine was deprived of it for only ten minutes you may convict the defendant of larceny."

The sole interest the A. C. A. has in taking up the case is to make it the means of reaching a final decision which will define such "borrowing" of vehicles by employes as larceny. The club already had taken up for this purpose, the case of Frank Kenny, who "borrowed" a milk wagon, rode around in it for several hours and then abandoned it. Kenny was found guilty of petit larceny in that he used the axle grease of the wagon and deprived the owner of its use. Judge Foster sentenced him to the penitentiary for three months.

VERMONT MAY TAX HORSEPOWER

Measure to Assess Motor Vehicles on that Basis Passes the House—Opponents to Make Fight in the Senate.

Taxation of motor vehicles, based on horsepower rating of the machines, is proposed in a bill which passed the lower branch of the Vermont legislature just before the Christmas holidays, and upon which a strong fight is to be made in the Senate. This bill provides for a graduated registration fee, ranging from $5 to $55 per year. The fee for the first year is based upon the actual horsepower. The horsepower is computed at 25 per cent. less the second year, 50 per cent. less the third year, and 75 per cent. less the fourth year and each subsequent year. Provision is made that the receipts from registration fees shall be turned into the highway fund to be apportioned among the counties on the basis of population, and the bill is favored by C. W. Gates of Franklin, State highway commissioner. It is estimated that the tax would raise from $40,000 to $50,000 annually. The argument in support of the bill is that the use of automobiles is not local and is a a cause of damage to highways throughout the State.

Among the opponents of the bill, which was passed through the house by the strong aid of rural members, are representatives of the cities and large towns. The ground of their opposition is the unfairness of the measure in regard to the large places. Representative Barber, of Brattleboro, who has opposed it from the start, says the passage of the bill would take more than $125,000 of taxable property from Brattleboro's tax list, and the small towns would get the benefit of it. Probably twice as many automobiles are owned in Brattleboro as in all the rest of the county. Mr. Barber believes that there would be no justice in taxing automobiles on any other basis than other property is taxed or in making the 1,200 automobile owners in Vermont pay one-fourth of the entire highway tax of the State as would be the case under the method of taxation the bill contemplates.

Motorists Object to Gasolene License.

Fire Marshal Gladwin, of New Haven, Conn., has caused a sort of gasolene explosion in that city by putting in force a regulation which requires every person who keeps more than a pint of that commodity to pay a license fee of $1. If the amount kept is two gallons, or over, the fee is $5. Individual complaints by a number of motorists have led the Automobile Club of New Haven to work for the abrogation or at least a modification of the ordinance. Consultations have been held with Corporation Counsel Rogers and a favorable outcome is expected.

REAL RACING AT ASCOT PARK

Two Days Meet Full of Thrills—Hughes Makes Fastest Mile and Seyfried's Car Throws Its Driver.

For thrills, fast times and general all-around interest at the two days' meet as Ascot Park track, Los Angeles, Cal., December 26 and 27, under the auspices of the Southern California Automobile Dealers Association, the first day's racing easily was the better. The grandstand at Ascot Park accommodates 6,000 people without crowding, but when Starter Moross called the first event a few minutes before 3 o'clock on Saturday, the stands were filled to overflowing; the program contained many exhibitions, but good racing was furnished in several of the competitive events.

The best race of the afternoon was the twenty-five miles stock car derby, despite the fact that Soules in a splendidly-tuned car, had much the better of the scramble from the crack of the gun at the start to the dropping of the flag at the end of the quarter century. Soules reeled off mile after mile in close to a minute and covered the entire distance in 25:36⅗, which from a standing start, is "going some" for a stock car. Harold Stone in a Marmon was second, and R. L. Greer, Mitchell, finished third. Soules also showed speed in the five miles handicap. Starting from scratch he rapidly overhauled the field and won handily in 5:08⅘.

Another interesting event was the five miles for cars costing $3,500 or less. The crowd had picked Hugh Hughes in a Pope-Hartford to win, but Gus Seyfried, in a White, upset all calculations by winning a brilliant victory in 5:46⅗, while Stone nosed Hughes out of second place.

Two novelty events afforded considerable amusement for the crowd. In the five miles, which G. A. Bingham, in the Jackson won, the cars picked up passengers on the second mile and discharged them on the next lap. The passengers consisted mainly of a lot of raw novices and a majority of them were in such a hurry to get off the cars that the track stretch resembled a football field after a hard scrimmage. The two miles novelty was won by Harold Stone in a Marmon car.

It was quite natural that the spotlight of public interest should be focussed upon the big racing cars of Oldfield, Seyfried, Soules and Hughes, and when Soules came out for his mile time trial, he was given the glad hand, for there are many persons that believe, given an equal chance, Soules can cut up just as many didoes on the track as can Barney Oldfield. In their exhibitions Soules did a mile in 1:01, and Oldfield in 56⅗ seconds.

The best time of the afternoon was scored by Hugh Hughes—a professed Englishman—who handled the big front drive Christie car. Had the track been less dusty Hughes might have broken the track record of 51 seconds held by Ralph DePalma. As it was he covered a lap in 53⅗ seconds.

There is no telling what Gus Seyfried might have done in the Whistling Billy White steam car had not his desire to make Oldfield, Soules and Hughes look like selling platers overcome his caution. Seyfried is a San Francisco boy and although his track experience dates back only six months the youngster has shown decided ear marks and fear is a word not in his vocabulary.

Seyfried got away to a splendid start and came down the stretch at a speed of 90 miles an hour. The clockers caught him at the eighth post in 6⅕ seconds, but just after that a thrilling sight occurred. Seyfried did not appear to slacken for the curve and the crowd held its breath and watched the long white mastodon point its nose toward the turn, then suddenly veer straight for the fence. The front wheels would not hold to the angle and just as one of them collapsed the car overturned, throwing Seyfried clear. Seyfried had one or two cuts in his face, but an hour later was around, smiling as though nothing had happened. When the car upset the gasolene leaked out and caught fire.

The match between Oldfield and Hughes, the latter driving the Christie, was a disappointment, as Oldfield won in a walkover. This freak front drive creation is possessed of great speed for a mile or so, but it does not seem able to hold up for longer distances and this proved the case at Los Angeles. Hughes held his own against Oldfield for a mile and one-half, but as he came into the stretch for the third mile, the car was missing badly. After that there was nothing to the race but Oldfield.

There was just as large a crowd present on Sunday as there had been on Saturday, but the racing was not up to what it had been the day before, due principally to a slow track. A heavy fog came up before the meet finished and almost obscured the back stretch.

There was only one accident during the afternoon and due to the cool-headedness of Harold Stone that, fortunately, was devoid of casualities. In the third lap of the 25 miles stock car derby the right front tire on Stone's Marmon burst and in the ensuing efforts to keep the machine from zig-zagging into the fence the steering knuckle broke. Stone jammed on the brakes just as the wheels parted and let the nose of the car into the track.

The exhibitions by Oldfield, Soules and Seyfried were nothing above the ordinary. Soules turned a mile in 58⅗ seconds, and Seyfried in a stock car did three miles in 3:20. Oldfield made one circuit of the track in 55⅘ seconds.

Stone in the Marmon won three of the stock car events, and Bingham, Jackson, took the short novelty race. Two good stock car victories went to the White.

The three miles match between Oldfield and Soules was exciting enough for the most exacting. These two veterans of the track chased each other for nearly 2½ miles, Soules having the advantage coming into the stretch. In the final sprint Oldfield came up fast, but Soules met his burst of speed with a sprint and the cars flashed over the tape so close that the judges had to decide a dead heat. The summaries:

First Day—Saturday.

Five miles for cars costing $3,500 or less—Won by Gus Seyfried, White; second, Harold Stone, Marmon; third, Hugh Hughes, Pope-Hartford. Time, 5:46⅗.

Five miles novelty, for cars costing $2,000 or less—Won by G. A. Bingham, Jackson; second, John Heyser, White; third, A. Bagsdale, Cleveland; fourth, W. Lee, Tourist. Time, 9.13 1-5.

One mile exhibition—By Charles Soules. Time, 1:01.

One mile exhibition—By Barney Oldfield. Time, 0:56⅗.

One mile exhibition—By Hugh Hughes. Time, 0:53⅗.

One mile novelty race—Won by Harold Stone, Marmon; second, A. Bagsdale, Cleveland; third, John Heyser, White. Time, 2:10.

Twenty-five miles stock car derby—Won by Charles Soules, Stearns; second, Harold Stone, Marmon; third, R. L. Greer, Mitchell. Time by five miles, 5:14⅗, 10:19⅕, 15:21⅘, 20:27⅗ and 25:36⅗.

Five miles free-for-all handicap—Won by Charles Soules (scratch); second, Harold Stone, Marmon (0:35); third, R. L. Greer, Mitchell (1:10); fourth, Hugh Hughes, Pope-Hartford (0:35). Time, 5:08⅘.

Five miles match between Barney Oldfield and Hugh Hughes—Won by Oldfield in walkover. Time by miles, 1:03⅘, 2:02⅕, 3:01⅘, 3:58⅕ and 4:54⅘.

Second Day—Sunday.

Three miles novelty—Won by G. A. Bingham, Jackson. Time, 5:14.

Five miles for stock cars listed at $3,500 and under—Won by Gus Seyfried, White. Time, 5:42⅘.

Five miles novelty—Won by Harold Stone, Marmon. Time, not given.

One mile exhibition—By Charles Soules. Time, 0:58⅗.

One mile exhibition—By Barney Oldfield. Time, 0:55⅘.

One mile combination race—Won by Harold Stone, Marmon. Time, 2:26.

Three miles match between Charles Soules and Barney Oldfield—Dead heat. Time, 3:00.

Three miles against time—By Gus Seyfried, White. Time, 3:20.

Twenty-five miles stock car derby—Won by Charles Soules, Stearns. Time, 28:30.

Five miles handicap—Won by White car (0:30); second, Harold Stone, Marmon (0:40); third, Charles Soules, Stearns (scratch). Time, 5:51.

The Week's Patents.

900,111. Transmission Gear. Robert J. Million, Jefferson township, Carroll county, Ind. Filed June 12, 1906. Serial No. 321,334.

1. The combination of a revoluble member, a frame mounted thereupon and adapted to move so as to allow the said revoluble member to swing bodily upon an axis different from its axis of rotation, another revoluble member engaging said first mentioned revoluble member, a movable member supporting said second mentioned revoluble member so as to allow it to swing upon an axis independent of its axis of rotation, said revoluble members engaging each other directly, and means for turning said first mentioned revoluble member.

900,154. Lubricating Oil Distributor. Louis Dubrulle, Paris, France. Filed Jan. 2, 1907. Serial No. 350,505.

In a lubricator, a primary pump, a plurality of secondary pumps, and discharge pipes therefor; a rod on which all the pistons of the aforesaid pumps are mounted, a header provided with sight feeds for the secondary pumps, an inlet pipe and a discharge pipe leading, respectively, to and from the header, the primary pump being arranged to supply the header with lubricant and to remove the excess therefrom, the secondary pumps being arranged to take lubricant from the sight feeds and deliver it to the discharge pipes, and means for reciprocating the rods.

900,160. Motor Vehicle Truck. Rodolphus Fuller, Detroit, Mich. Filed Nov. 21, 1906. Serial No. 344,387.

1. In a truck for electric motor vehicle, the combination with a fixed axle and independent driving wheels thereon, of a drive shaft and a driven shaft substantially in the horizontal plane of the axle and in rear thereof, the driven shaft being in rear of the drive shaft and centrally provided with a differential gear, an electric motor upon one end of the drive shaft, a variable speed transmission gear upon the other end of said shaft and a drive pinion sleeved upon said shaft between the motor and said variable transmission gear and transmitting motion from the transmitting gear to the differential.

900,199. Roller Bearing. Julius A. Perkins, Omaha, Neb., assignor, by mesne assignment, to United States Roller Bearing Company, Jersey City, N. J., a Corporation of New Jersey. Filed Aug. 14, 1903, Serial No. 169,500. Renewed Aug. 28, 1908. Serial No. 450,743.

1. A box having a residuum receptacle provided with a plurality of webs crossing the box and connected with the opposite sides thereof, said webs being provided for part of their length at the upper edges with tracks over which bearing rollers travel in their planetary movement about the journal of the axle, said tracks being so located as to enable the entire periphery of each bearing roller in its plenetary movement to be exposed above a space of the residuum receptacle.

900,342. Transmission of Power. Frank M. Ashley, New York, N. Y. Filed Nov. 26, 1902. Serial No. 132,965.

1. In power transmitting apparatus, the combination of an accumulator of sufficient capacity to act as a storage of power as set forth, means for delivering liquid to said accumulator, a motor in operative relation with respect to the accumulator and embodying a plurality of rotary power elements of different diameters with respect to each other, nozzles coactive with said power elements and capable of a uniform jet velocity, and provision for independently placing said nozzles in communication with the accumulator.

900,359. Changing Batteries in Electrically Propelled Vehicles. Albert J. Doty, Mount Vernon, N. Y., assignor of one-half to Charles Berg, Philadelphia, Pa. Filed Feb. 3, 1909. Serial No. 413,948.

1. The combination with an electrically propelled vehicle having a battery receptacle depending from its bed and provided with an opening at each side of the vehicle, of a pair of battery trucks on opposite sides of the vehicle in position to deliver a battery from the other side, means for detachably connecting the trucks to the vehicle and mechanism for moving a battery from one of the trucks into the receptacle against a battery therein, whereby the latter will

900,388. Shock Absorbing Mechanism for Vehicle Springs. Wellington P. Kidder, Boston, Mass. Filed Jan. 11, 1907. Serial No. 351,852.

1. In a shock absorbing mechanism for vehicle springs, a vehicle body portion, a supporting axle, a spring intermediate of the axle and the body, a toggle joint intermediate of and connecting the axle and body and comprising a comparatively short member and a comparatively long member, the short member being provided with a curved bearing surface at its end farthest from the long member and a friction mechanism comprising a spring actuated plunger bearing against said curved surface on the short member for the purpose set forth.

900,389. Self Propelling Combined Harvester, Agricultural Engine, and Truck. Fred L. Kincaid and Henry T. Preble, Stockton, Cal. Filed Aug. 31, 1905. Serial No. 276,627.

1. A machine of the class described comprising a truck provided with a guide wheel in front and bearing wheels at the rear, two motors mounted on the truck, means for connecting either one or both of the motors with the bearing wheels, a threshing cylinder located upon the truck, and means operatively connecting the threshing cylinder with the motors.

900,450. Variable Speed Driving Mechanism. Marion E. Vaughn, Plainfield, Ind. Filed Feb. 8, 1906. Serial No. 300,103.

1. In a speed changing mechanism, driving and driven wheels with their sides in frictional engagement, and means for shifting the position of one wheel in the arc of a circle to which the engaging surface of the other wheel is tangential.

900,498. Pneumatic Tire. Horace W. Dover, Northampton, England. Filed April 8, 1907. Serial No. 366,985.

1. In a wheel provided with a pneumatic tire, the combination of a tire cover fastened to the sides of the wheel rim and having laterally extending hollow lobes situated radially beyond the point of attachment, a pair of side flanges gripping the said hollow lobes, and an inflatable inner tube confined between the cover and the wheel rim, in such manner that the internal pressure increases the grip of said lobes against the flanges, substantially as specified.

900,503. Driving Mechanism for Swinging Axles. Allen H. Fetzer, Galion, Ohio, assignor of one-eighth to Grover M. Shumaker and one-third to Melvin E. Shumaker, Galion, Ohio. Filed Nov. 30, 1907. Serial No. 404,478.

1. A mechanism of the character described, comprising an axle equipped with a ball having cavities in its periphery, the side walls of said cavities being convex and their end walls being concave and a sectional sprocket whose sections are provided with central aligning openings with their walls curved inwardly to conform to the periphery of said ball and means projecting from, and secured between said sprocket sections, for engagement with said cavities.

900,518. Gas Engine Starter. Raleigh W. Godfrey, Oberlin, Ohio. Filed Aug. 7, 1907. Serial No. 387,478.

1. A device of the class described comprising a reservoir, a tube or barrel adjacent thereto and containing a measuring chamber communicating with the reservoir through a port or duct, and two way valves in the tube or barrel adjacent to the ends of the measuring chamber, one of said valves being adapted to obstruct the port leading to the reservoir.

900,522. Picture Exhibition Device. James H. Gravell, Philadelphia, Pa., and George D. Farwell, Bridgeport, Conn., assignors of one-third to Percy C. Farwell, Bridgeport, Conn. Filed Nov. 1, 1907. Serial No. 400,306.

1. The combination of a self-propelled vehicle, a motor therefor, an electric generator, means for transmitting power from the motor to the generator, a picture exhibition outfit, and means for connecting the generator and picture exhibition outfit, with mechanism whereby the same motor is utilized for propelling the vehicle and for driving the generator, substantially as described.

900,604. Carburetter. Howard Small, Chicago, Ill., assignor to John W. Duntley and William O. Duntley, Chicago, Ill. Filed Dec. 28, 1904. Serial No. 238,600.

1. A carburetter having a plurality of vaporizing nozzles communicating with a common source of fuel and arranged in a circle, and a rotary disc valve for cutting one or more of the nozzles into and out of service at the will of the operator.

900,632. Pump for Pneumatic Tires. Henry M. Williams, Vincennes, Ind., assignor of one-half to J. Frank Whyte, Coatesville, Ind. Filed July 8, 1907. Serial No. 382,644.

1. In a mechanism of the class described, the combination with a revoluble support, of a guide-plate carried by said support, a cross-head slidably mounted on said guide-plate, a cylinder carried by said guide plate, a piston head in said cylinder, means connecting said cross-head to said piston head, a roller secured to said cross-head, and an adjustable cam member positioned contiguous to said cross-head and capable of being placed in the path of movement of said roller, whereby said piston will be reciprocated in said cylinder, when said revoluble support is rotated.

900,634. Ball Bearing. Frederick W. Witte, Chelmsford, England. Filed April 23, 1906. Serial No. 313,254.

1. A ball bearing comprising balls, a spacing device for the same adapted to unequally space the balls, an inner and an outer ring, each having a curved track, and having a gap for each ball in one of the rings only, passing from one side inwardly toward the track.

Three Mathesons Win

FIRST, THIRD and FOURTH PLACES

in capturing MacDONALD & CAMPBELL $600 Cup

300 Miles Mid-Winter Contest

FROM PHILADELPHIA TO WILKESBARRE AND RETURN

Over the Pocono Mountains, making also the highest team score against a field of

32 CONTESTANTS

including these cars: 2 Peerless, 1 Stearns, 1 Studebaker, 2 Cadillacs, 1 Acme, 3 Stoddard-Daytons, 1 Elmore, 2 Franklins, 3 Mitchells, 2 Wintons, 3 Oldsmobiles, 2 Maxwells, 2 Knoxes, 2 Ramblers, 1 Buick, 1 Premier.

Only three of the 32 cars had perfect time scores and these three were Mathesons.

No. 7 Matheson Wins First Place

For MacDonald & Campbell $600 Cup

This car, owned and entered by Mr. F. M. Kirby, Wilkesbarre, Pa., and driven by Mr. Kirby's chauffeur, William Miller, is a regular stock Matheson touring car which Mr. Kirby had driven over 7,000 miles prior to entering it in the contest. Actual running time, 5 hours and 31 minutes, breaking all previous records.

No. 15 Matheson Wins Third Place

This car, entered and driven by Mr. Ross Anderson, Wilkesbarre, Pa., was a regular stock Matheson touring car which had covered 18,000 miles in service prior to entering this contest. Actual running time, 6 hours and 4 minutes; also new record time.

No. 6 Matheson Wins Fourth Place

This car, entered by ourselves, was a regular stock Matheson touring car which had covered over 12,000 miles in service prior to entering this contest. Actual running time, 5 hours and 24 minutes, the fastest time ever made by any car over this course, Summer or Winter.

ALL THREE MATHESONS FINISHED WITH ABSOLUTELY PERFECT ROAD SCORES, MAKING EVERY CONTROL ON TIME.

Only one stop was made on account of tire trouble, proving our claim that the Matheson Car, due to its beautiful balance, chain drive and multiple disc clutch, is the easiest car on tires. Our customers usually cover from 5,000 to 10,000 miles on their original tires.

THE CONCLUSION: **The Matheson Car has proved in every endurance run it has entered that it is far and away the most reliable and serviceable as well as the most economical and fastest touring car in all the world**

AND THIS IS ALSO OUR GUARANTY.

SUPPLEMENTARY SPIRAL SPRINGS

¶ If every driver had to ride in his own tonneau, every car would be quickly equipped with Supplementary Spiral Springs. Owners are not intentionally selfish—many of them just thoughtless. Usually driving or sitting beside the driver, the riding qualities of the tonneau are to them practically unknown.

¶ Not so with the passengers. Rear springs must be strong enough to resist severe shocks under a full load. That means stiff springs under ordinary loads, with the shocks and jars transmitted to the passengers—guests whose comfort ought to be a first consideration.

¶ SUPPLEMENTARY SPIRAL SPRINGS take up all the average bumps and road inequalities and come into real action with the jolts and jars encountered at speed.

¶ With the S. S. S., your springs never whip or touch. They prevent breakage and are the most economical and useful accessory ever provided for a car. Every live dealer carries them and their attachment is a matter of a few hours' time. Do it NOW.

SUPPLEMENTARY SPIRAL SPRING CO.
Motor Mart, New York — 4555 Delmar Ave., St. Louis, Mo.

Full 18-20-Horse Power

For Speed—Dependability—Economy Under all Conditions of Weather—Hills—Mud and Sand—With no Experience necessary YOU CAN BANK ON THIS CAR.

Always Goes The Whole Route

In buying an automobile consider first cost, but hesitate longest to investigate upkeep and economy of fuel consumption. Buy a car where you can hold the maker to this guarantee. Insist on records of durability and the evidence of thousands of users' endorsements. We invite comparison of our catalogs—books—testimonials—which you can have for the asking. Write for them. But above all compare our factory facilities—expert workmanship—experience and the highest quality of every part of

The Invincible Auto-Runabout SCHACHT

with all others of this style car. Write us and investigate the meaning to you as an owner of a car like the Schacht. Full 18-20-horse-power—gearless—clutchless—Timken roller bearings throughout—easy riding long "Concord" springs—high, solid cushions, Goodrich rubber tires for economy of upkeep on all roads—Schebler carburetors, etc.—Full high class equipment found only on high priced cars.

The Schacht is the easiest to run, simplest, most practical, most economical car you can buy—Let us show you all the reasons why. Write for literature. If interested as an agent—let us make you our Special Proposition.

F&S Annular Ball Bearings

For equal size and equal quality of steel, the durability of a ball bearing is proportional to the number of balls that carry the load. Double the number of balls, and you double the life of the bearing.

F & S ANNULAR BALL BEARINGS

contain the maximum possible number of balls. The race is entirely filled—less only one ball for the separating spaces.

The ingenious yet simple manner in which this is accomplished gives an unbroken path for the balls while conserving rigidity in the races. The balls are *sprung* in through diagonal side slots *shallower* than the race grooves. Once in, the balls never touch the side slots, which in effect no longer exist.

Digitized by Google

The Remy 1909 High Tension Magneto can't be put out of commission by ordinary abuse.

It is literally "fool proof." Anybody can install it, whether he knows anything about machinery or not.

Even if an improper connection should be made it wouldn't injure the magneto.

And the Remy will stand more neglect and accumulation of oil, dirt and water than any other ignition system in the world.

The Remy is the American Magneto specially built to meet the bad roads and other hardships encountered by American cars.

Double ignition is provided with one set of spark plugs in the Remy. This feature is original with us.

The Magneto switch furnished with the Magneto is fitted with a push button for starting the motor upon the spark without cranking, where dry batteries are wired in connection with the Magneto.

On account of the extra hot spark furnished by this Magneto and the perfect timing of the gear-driven Magneto, from 5 to 25 per cent. more power is secured than where a vibrator coil and storage batteries are used.

We are the oldest manufacturers of Magnetos in America. We have the largest factory devoted exclusively to the manufacture of magnetos in the world. We have already sold over 17,000 magnetos for 1909 cars—more than all our competitors, foreign and domestic, combined have sold or can sell.

You therefore take no chances when you put in a Remy.

Ask any owner of a car made by the following companies. The Remy is a regular equipment on their machines:

Pope Motor Car Co.
Buick Motor Co.
Maxwell-Briscoe Motor Co.
Apperson Bros. Automobile Co.
Midland Motor Co.
Olds Motor Works
Regal Motor Car Company
Model Automobile Company
Overland Automobile Co.
Cameron Car Co.
Kissell Motor Car Co.
Crawford Automobile Co.
Buckeye Manufacturing Co.

See it at the New York and Chicago Automobile Shows

The Remy was used on the Buick that led all American cars in the Savannah races. It figured in scores of important victories during the last season.

Write us for illustrations and full description of our new high tension Magneto. We are building them in such large quantities that we can make you attractive prices. We can very likely furnish you fittings for attaching the Magneto to your automobile, or almost any garage could install it without the fittings. Ask for it upon your new car.

Address Department 11.

This Tire Will Give You The Best Service

There may be other tires on the market that probably look from outside appearance to be as good as the G & J, but if you will get sections of the different tires and compare the quality of rubber, its toughness, and the manner in which it is embedded into the meshes of the fabric you will note there is a difference. After making this comparison and also noting carefully the general construction, you will not wonder why so many are specifying G & J Tires.

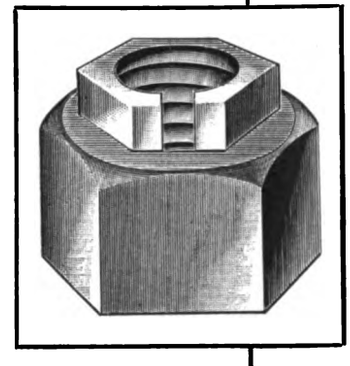
"Locking the door after the pony is stolen"



is a good deal like postponing the use of

Columbia Lock Nuts

Now

for it's only a postponement at best. Why not take a double-twist on the forelock of old Father Time and incorporate the use of Columbia Lock Nuts in your construction BEFORE you have occasion for regrets? Columbia Lock Nuts are in general use and are regarded as a necessity by some of the biggest railroad systems in the country. They ought to be a double necessity on automobiles. They are already used by many prominent makers. They should be used on every automobile everywhere.

¶Columbia Lock Nuts simply cannot work loose. Vibration, even the constant vibration of solid tires, cannot affect or loosen them. They are automobile insurance of the very best kind and their cost is not a factor. Let us prove our case.

COLUMBIA NUT & BOLT COMPANY

The Best Equipped Car

from an Ignition standpoint, is the one fitted with a

SPLITDORF MAGNETO

The inevitable result of using a cheap and poorly made Magneto is trouble, loss of time, disappointment and endless expense.

This is not theory at all, but the actual experience of those who have been tempted to save a few dollars at the start.

Although its price is somewhat higher, it is *positive economy* to equip your car with a SPLITDORF Magneto because of the better, more uniform and absolutely reliable ignition you thereby obtain.

Simplicity of construction, interchangeability of parts and accessability are among its strong features. Completely water-proof, dust-proof and fool-proof.

Remember always that there is fifty years of invaluable electrical engineering experience and the largest and best equipped Ignition Specialty plant in the world behind the SPLITDORF product—fifty years of continuous endeavor to produce the highest grade of goods in the market.

Be guided by the big majority of experienced motorists, who concede SPLITDORF Ignition to be the best.

Get our Magneto catalog for details. We exhibit at the Madison Square Show. Elevated Platform, Space 102.

You Who Know All About Automobiles

You who know all about carburetors—magnetos—transmissions— lubricating systems—Do you know ALL about TIRES? Do you know why one tire blows out at 2,100 miles, while its running mate stands up for 12,000 or 15,000?

If you lack proper tire knowledge, your tires are apt to cost you more than your engine—more than your gasoline—more than all the other outlays your motor car demands.

Please understand, first, the difference between a **moulded** tire and a **wrapped tread** tire.

The moulded tire is built up, layer by layer, on an iron core. Over it is clamped an iron mould. And when the heat of the curing process is applied, that rubber expands—and, in expanding, forces a perfect union between the various layers of rubber and of fabric.

In building up that tire on the iron core, a skilled workman lays fabric on fabric, rubber on rubber. It is a feat of dexterity.

Yet, skilled as he may be, he cannot wholly avoid wrinkles, irregularities, unevenness, which, under the pressure of curing, multiply themselves into **hidden** weaknesses and defects.

Some tires, instead of being cured on an iron core, are cured on an **air bag.**

The air bag is really only another name for an inner tube—an extra strong inner tube. When the air bag has been inserted in the built-up tire, strong tape is wound around it, and then it is cured in live steam.

The advantage of the wrapped tread process is that the air bag, full of compressed air, smoothes out those wrinkles and irregularities and prevents those hidden weaknesses and defects.

The advantage of the wrapped tread process is, for this reason, immeasurable. But there is one disadvantage: The tire made by this process does not get the **terrific squeeze** that the moulded tire gets when the heat expands it between core and mould—the squeeze that forces the rubber into the fabric, making a perfect union between fabric and rubber. In losing that squeeze, it loses durability, strength, unity—which more than offset the fact that the wrapped tread tire can have no hidden wrinkles or unevenness.

Obviously, the tire you ought to have is one that is built upon an iron core—**squeezed** the same as a moulded tire—and **finished** on an air bag to smooth out the irregularities. Such a tire would be costly to its makers. It would combine the expenses of making a moulded tire and a wrapped tread tire.

Yet in spite of the added cost, there is one tire made in just this way—**only one.** It is the Goodyear Quick Detachable. The Goodyear Quick Detachable costs **you** only a trifle more than the common moulded tire with its inevitable hidden defects—only a trifle more than the wrapped tread tire, with its inevitable weakness.

The Goodyear Quick Detachable, because it combines the best of the two processes, and does away with the shortcomings of both, will cost you less per mile to run than any other tire which can be made.

This one point of superiority is reason **enough** why the Goodyear Quick Detachable can be expected to outwear tires of any other make. But there are other reasons—other superiorities.

The Goodyear Quick Detachable is, for example, an **oversize** tire.

That is, the **32x4 size** is nearly a 32x4½ tire—and other sizes are oversize, in proportion.

The Goodyear tire is made larger than the specifications call for. It is simply 15% larger, and 15% better than any other tire marked the same size.

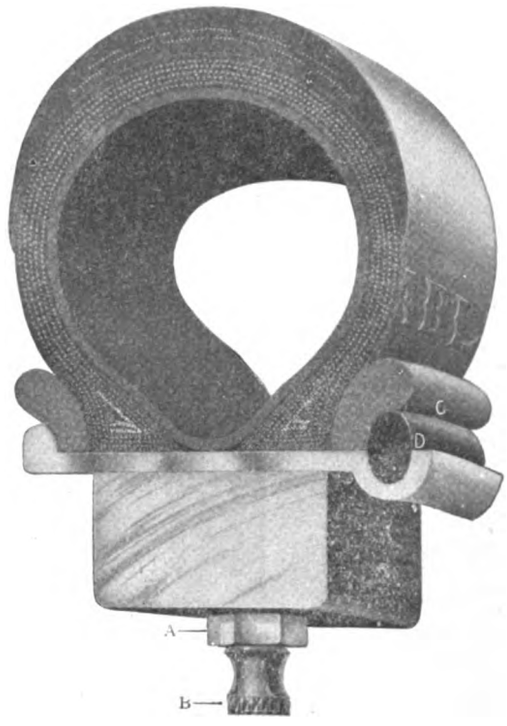
There are countless other Goodyear superiorities.

There is, for instance, the Goodyear rubber-rivet breaker-strip, which makes it impossible for the tread to split or peel from the carcass of the tire. This exclusive Goodyear device, protected by patent, deserves a full page of description here.

But it is cited merely as one of the Goodyear superiorities—superiorities which extend from the raw materials to the workmanship—from scores of exclusive Goodyear processes to the Goodyear piano-wire tape described elsewhere on this page.

You want proof: There are in New York City 1,000 taxicabs.

More than on any other one thing, the profit of the taxicab business depends on keeping down tire expense.



The owners of the 1,000 taxicabs in New York City tried all the experiments possible to try. They measured the values of the tires they tested purely by the cost per mile of the service they gave.

The taximeter, you will understand, checked up by the cash receipts, told the mileage of the tires unerringly, indisputably. And the result of the cold-blooded test is that:

Today, 800 out of the 1,000 taxicabs in New York, operated by several competing companies, have contracted for Goodyear tires to be used exclusively.

These 800 taxicabs are doing 60,000,000 tire miles a year. More than 1,000,000 tire miles a week!

How Tire Nuisance and Expense May be Avoided

To take off the Goodyear Quick Detachable Tire on Universal Rim in 60 seconds, use any small wrench to loosen nut "A." Do the rest like this: Push valve stem "B" up into the tire, press outer flange ring "C" inward lift out locking ring "D," slide ring "C" off and then the tire. Put it back same way. Sixty seconds either way.

Notice the ends of the piano-wire tape surrounded by heavy black rubber in each foot of the tire. This piano-wire tape is an exclusive Goodyear feature. Its value is that the tighter you pump your tire the tighter this tape holds the tire on the rim.

No more tire pumping! With a Goodyear small steel air bottle, you can automatically inflate your tires in a few seconds to the exact pressure that is best for them. The bottle is carried in a box under the seat. Simply attach the tube from the bottle to the tire, open valve, and the tire will speedily inflate with pure air to the pressure required.

Any woman or child can inflate a tire in this way.

The Goodyear Air Bottle costs only $15 for the small size and $20 for the large size, filled with compressed air. The first cost is the only cost for two years. When the bottle is empty, simply turn it in at any of our stores and receive free a new bottle, ready charged. You exchange the empty bottle for a new charged one instantly—no waiting necessary. Each bottle will fully inflate four to thirty-five tires, according to their size. It will partially inflate many more.

And what is true of the taxicabs of New York is equally true of the taxicabs of Boston, of Washington—of practically every large Eastern city where taxicabs are used. Eight out of every ten of them are using Goodyear tires exclusively. Think of that, you who have blindly groped at the tire problem—you who have bought tires wholly by hearsay!

A hundred times more than can be explained in a page like this, you will find in our book, "How to Select an Auto Tire." Send for it now. It is free.

HAYNES

"Feels Like a Six!"

THE EXPERIENCED CHAUFFEUR who drives a 1909 Haynes for the first time becomes instantly conscious of a certain difference between the Haynes motor and other four cylinder engines. The common remark is "It feels like a six."

We accomplished this in the simplest possible way. Just the addition of an extra fly wheel at the front end of the motor. The balancing weight being thus distributed gives an engine that pulls better at slow speeds and more smoothly at high speeds. It adds to the flexibility of the motor and gives superior evenness of torque without increasing one particle the complication or the cost.

It is so like a six cylinder car that we determined not to manufacture the latter type since the additional complication could not be justified.

The Haynes for 1909 is practically a six cylinder for driving purposes, and a four cylinder in price and maintenance cost. No other four cylinder car will satisfy you after you have investigated the Haynes.

AGENTS: The above is one of the many facts about the Haynes which makes them the easiest first-class car on the market to sell.

Our responsibility is assured by the fact that we are the oldest manufacturers of automobiles in America.

Certain territory is open this year. Speak quick.

TIMKEN

New One-Piece Pressed Steel Power Axle

¶ The new Timken Axles as shown in the illustrations herewith, is a one piece pressed steel form, shaped to give better than truss resistance to load, end thrust and breaking strains, and eliminate the vibration common to cast steel or forged axles of the built up type.

¶ The entire housing is a load bearing and gear encasing member in a single unit, clear and smooth, without angles or protruding parts, supports or braces, with nothing to vibrate, nothing to rattle, nothing to work loose, nothing to catch mud and easy to clean.

¶ The power unit (differential bearings and adjustments for same, pinion shaft and bearings, drive and pinion gears), is a compact unit that can be removed bodily from the axle case or housing, without taking down the axles or disturbing brake equipment, springs, hubs or bearings.

¶ The axle, complete with differential gear carrier, brakes and spring seats, is made in both clutch and fixed type hubs for cars weighing from 1,500 to 3,000 pounds empty, and 45 horsepower or less. See these new axles at the Timken exhibit at the Shows, or write direct for illustrated descriptive matter.

We will exhibit Madison Square Garden, January 16th-23rd; Chicago, February 6th-13th

The extra trouble and expense we put

on

MORGAN & WRIGHT TIRES

before they leave the factory will take the place of the trouble and expense you have been accustomed to put on your tires when they were in service.

We attribute a large measure of the success of our tires to our system of inspection—starting with the testing of the pure Para gum and Sea Island cotton fabrics—continuing up thru the processes of compounding, frictioning and building—and ending only when the finished tire has been pounded, stretched, turned inside out and put thru every conceivable test that will develop imperfections if any are ever to develop.

You can materially reduce your car maintenance bills by letting us bear the expense of proving the quality of your tires.

And they cost no more than other brands.

12-Passenger Pullman
For the profitable business of sight-seeing hotel work, summer and winter resort work, etc.

1-Ton Open Job
For all kinds of carting purposes.

1-Ton Panel Job
Suitable for dry goods and general delivery work.

The 5-Ton Truck
Built in 3, 4, 5 and 6 ton sizes suitable for

flour mills, breweries, lumber companies, coal companies and any line of business requiring a heavy-duty power wagon. ..

HERE is a proposition for the one best man in every city—for the broad-gauge business man or agent—a proposition full of opportunities—one which means more money for the agent during 1909 than ever in the past; namely **representing and selling**

Rapid Commercial Power Wagons

We want agents—hustling business getters—men with financial backing—not chauffeurs or demonstrators—and to the one in each locality who secures the agency for **Rapid Commercial Power Wagons,** we will put behind him one of the greatest selling and advertising campaigns ever put behind any commercial wagon proposition.

More money, more new plans, more legitimate aids will be given the agent for **Rapid Commercial Power Wagons** than ever before.

Write to-day for our agency proposition.

The RAPID Line for 1909

comprises models ranging from 1,000 pounds up to 6 tons, as follows: **Rapid Commercial Power Wagons** for any line of business in ½, 1, 1½, 2, 3, 4, 5 and 6-ton sizes.

Motive power: engines of the two-cylinder opposed 24 to 30 H.P. type, up to four cylinders, 60 H.P., vertical, heavy duty motors.

The Rapid line for 1909 offers the largest selection of models ever manufactured.

Therefore every user of one or more horses represents a prospective buyer of **Rapid Commercial Power Wagons.**

There are no theories represented in the Nineteen Hundred Nine **Rapid Commercial Power Wagons.** All mechanical and other details have been proved correct by over ten years of actual service in the hands of hundreds of users in over fifty different lines of business.

We have spent **over a quarter-million dollars** to bring **Rapid Commercial Power Wagons** up to their present state of perfection and efficiency.

The agent who handles **Rapid Commercial Power Wagons** will have a line that can back him up—a line that has **"made good"**—one that has met the requirements of commercial motor wagon practice, and needs no apologies.

A word about the **Rapid Motor Vehicle Company:** It is the largest and oldest in the commercial car business—and makes nothing but Rapid Commercial Power Wagons, which are **"BUILT FOR BUSINESS."**

The agent who "ties up" to our organization gets backing which means a great deal, not only in influence, but in protection and fair treatment; a factory which can stand back of its product with a guarantee that means just what it says and a factory which helps its agents in every way possible.

Just to remind you—write to-day.

See us at the New York, Boston and Chicago Shows.

THE SELDEN CAR

MADE BY

"The Father of Them All"

One Price, $2,000. F. O. B. Rochester.

TOURING CAR, ROADSTER, TOY TONNEAU

A genuinely good car cannot be made and sold for less than $2,000. By this we mean a car like the Selden, containing nothing but the best of materials, workmanship and finish. A car that the manufacturer can stand behind and guarantee for at least a year against any imperfections in workmanship or material.

We buy only the best materials, employ only skilled labor and pay particular attention to details and finish, thereby producing a strictly high-grade car at the lowest possible price.

The up-keep and maintenance of a medium-priced car like the Selden is within the reach of any man of moderate means and the value of the car does not depreciate like that of the lower priced cars. This is the point to be considered by every purchaser.

The Selden Car is a 4-cylinder 28-30 horsepower (developing 37 horsepower) five passenger Touring Car or three passenger Roadster, with 114-inch wheel base, 34-inch wheels, shaft drive, selective control, pressed steel frame, metal body, fully equipped.

Superb riding, roomy tonneau, luxurious upholstery, smooth running, great hill-climber, flexible and easily handled, economical in maintenance and up-keep, fine finish, stylish and attractive.

THE COMING CAR OF MODERATE PRICE

Catalog and Agency proposition upon request. Agencies wanted everywhere.

We will exhibit at Madison Square Garden Show.

GIBNEY SOLID TIRES

For Commercial Vehicles and Carriages

Twin Solid Tire

The Tires for Long Wear, Hard Service, All-Round Economy

They are strong enough for the heaviest commercial truck or bus, yet resilient enough to take all the jolts and save the vehicles.

Made with the greatest possible percentage of pure Para rubber, they are without question the superior of any solid tire in the world.

The marvelous growth in sales of Gibney tires is solely attributable to the fact that they have given longer service and greater satisfaction than any tire on the market.

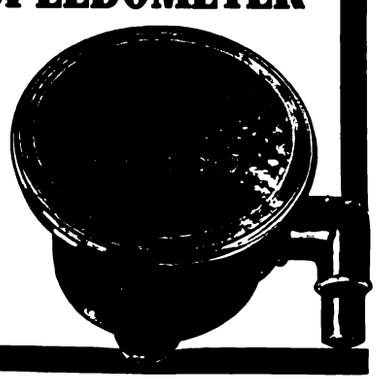
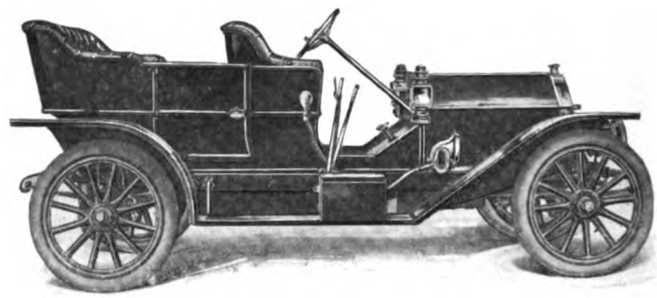
Constant Accuracy At All Speeds!

JONES SPEEDOMETER



is the most accurate speed-indicator obtainable. This was proven when the Jones won the R. A. C. Gold Medal for ACCURACY, defeating ALL other instruments entered. The accuracy of the Jones is its strongest recommendation—that is why it has been officially adopted by the police of all the larger cities; that is why it is used by the leading race-drivers; that is why it is found on the greater majority of cars the world over. It responds to every change of speed from 1 to 100 miles.



See our exhibit at Madison Square Garden.

THE JONES SPEEDOMETER

76th St. & Broadway
NEW YORK

Chicago, 1421 Michigan Ave.; Philadelphia, 259 No. Broad St.; Boston, 109 Massachusetts Ave.; Cleveland, 1841 Euclid Ave.; Los Angeles, 930 S. INTER-STATE TOURING CAR, $1,750.

The Inter-State

THE INTER-STATE is a new car, but its designers and builders are **not** new. It is a car of proven worth in every detail—representing the **highest known superiority** in automobile design and construction. If there were any way to make a **better** car we would make the INTER-STATE THAT WAY.

Every part of the INTER-STATE is there for good reason—best service. One of the many superior features of the INTER-STATE is the transmission system and the method of its hanging.

The transmission proper is the three-speed selective type and reverse, with vanadium steel gears. We build the selective mechanism inside the transmission case, insuring thorough and constant lubrication, and combine the clutch (disc) and transmission in the same case—the clutch being in a separate compartment—all mounted rigidly on the end of the torsion tube. The weight of the transmission and the driving force of the rear axle are taken on a large ball and socket joint supported from a rigid cross-bar mounted on the frame just back of the motor. The transmission, the rear axle and foot levers are complete as a unit before being installed. We unite the gear shifting mechanism to the hand levers by our own patented device, which gives absolute reliability under all conditions.

This system of combining the transmission and the clutch gives us the simplest and best three-speed selective type car made, **with greatest durability.**

The same high standard of service quality is maintained throughout the INTER-STATE. It is a **permanent enduring** car at a price but little higher than the price of temporary cars. The INTER-STATE complete—with Eisemann Magneto—at $1,750 is the biggest value on the 1909 market. We want you to see this car before you think of spending your money for a **cheap** car, or even for a higher priced car.

At the Chicago Show— The full line of INTER-STATE automobiles—including Standard Touring Car, Demi-Tonneau, Double Rumble Roadster, Single Rumble Roadster, and Tourabout—will be exhibited at the Coliseum, Chicago, February 6-13.

Dealers and agents will appreciate the opportunities opened to them by the INTER-STATE. Write for our proposition.

Three Mathesons Win

FIRST, THIRD and FOURTH PLACES

in capturing MacDONALD & CAMPBELL $600 Cup

300 Miles Mid-Winter Contest

FROM PHILADELPHIA TO WILKESBARRE AND RETURN

Over the Pocono Mountains, making also the highest team score against a field of

32 CONTESTANTS

including these cars: 2 Peerless, 1 Stearns, 1 Studebaker, 2 Cadillacs, 1 Acme, 3 Stoddard-Daytons, 1 Elmore, 2 Franklins, 3 Mitchells, 2 Wintons, 3 Oldsmobiles, 2 Maxwells, 2 Knoxes, 2 Ramblers, 1 Buick, 1 Premier.

Only three of the 32 cars had perfect time scores and these three were Mathesons.

No. 7 Matheson Wins First Place

For MacDonald & Campbell $600 Cup

This car, owned and entered by Mr. F. M. Kirby, Wilkesbarre, Pa., and driven by Mr. Kirby's chauffeur, William Miller, is a regular stock Matheson touring car which Mr. Kirby had driven over 7,000 miles prior to entering it in the contest. Actual running time, 5 hours and 31 minutes, breaking all previous records.

No. 15 Matheson Wins Third Place

This car, entered and driven by Mr. Ross Anderson, Wilkesbarre, Pa., was a regular stock Matheson touring car which had covered 18,000 miles in service prior to entering this contest. Actual running time, 6 hours and 4 minutes; also new record time.

No. 6 Matheson Wins Fourth Place

This car, entered by ourselves, was a regular stock Matheson touring car which had covered over 12,000 miles in service prior to entering this contest. Actual running time, 5 hours and 24 minutes, the fastest time ever made by any car over this course, Summer or Winter.

ALL THREE MATHESONS FINISHED WITH ABSOLUTELY PERFECT ROAD SCORES, MAKING EVERY CONTROL ON TIME.

Only one stop was made on account of tire trouble, proving our claim that the Matheson Car, due to its beautiful balance, chain drive and multiple disc clutch, is the easiest car on tires. Our customers usually cover from 5,000 to 10,000 miles on their original tires.

THE CONCLUSION: **The Matheson Car has proved in every endurance run it has entered that it is far and away the most reliable and serviceable as well as the most economical and fastest touring car in all the world**

AND THIS IS ALSO OUR GUARANTY

At Chicago Show, February 6-13.

The Easiest Riding Car In The World

'Tis not in mortals to command success, but we'll do more—deserve it.

Mayo Radiators have achieved success by deserving it, and in no other way.

¶ Therefore that success is presumably of the permanent and abiding kind.

¶ Price is the cause of the absence of MAYO RADIATORS from cheap cars.

¶ Quality is the reason for the presence of MAYO RADIATORS on most of the good cars.

¶ The only argument against MAYO RADIATORS is their price.

¶ Every other consideration dictates their use.

¶ MAYO RADIATORS combine sound mechanical principles, exact design, construction and workmanship, together with graceful appearance and perfect finish; in short, all the good qualities that go to make the ideal radiator.

¶ MAYO RADIATORS are stamped with the hallmark of class.

¶ MAYO RADIATORS are really the thoroughbreds of the radiator world.

¶ MAYO RADIATORS are made in the kind of a factory that befits them and by the MAYO RADIATOR COMPANY, at New Haven, Connecticut.

TIRE LUGS NOT INFRINGEMENTS

Persistent Efforts to Stretch an Old Patent —Would Have Had Wide Effect if Successful.

A fight to bring the use of almost all forms of tire lugs under the terms of a patent held by the Boston Woven Hose & Rubber Co., of Boston, Mass., has been waged by that concern for some time, the litigation taking the form of an action against the Pennsylvania Rubber Co., but the latter company, in a decision just given publicity, has won a victory not only for itself but for tire manufacturers in general who employ lugs on any of their products. Taking an appeal from an unfavorable decision in the Circuit court of the United States for the district of Massachusetts, the Boston Woven Hose & Rubber Co. carried the case to the Circuit Court of Appeals, in an endeavor to establish its claim that the usual forms of tire lugs come under the specifications of the Schrader patent, No. 466,577, which it owns, but the court, while practically indicating that had the patent been previously worked under it might have been stretched to cover the situation, applied the rule that in a suit for infringement a patent for an alleged invention of which no practical use has been made is not entitled to the same breadth of construction which might be warranted by its proved usefulness.

Only the second claim of the patent was in issue, reading as follows: "2: The combination of the U-shaped tire, the felly, an inflated tube confined by said tire, and an internal clamping device, between which and the felly the U-shaped tire is secured, substantially as described." This was held by the complainant to cover such devices as lugs and staybolts. The court, consisting of Putnam and Lowell, circuit judges, and Aldrich, district judge, decided otherwise.

In a formal decision by Judge Putnam, it was pointed out that the device described in the patent is continuous around the entire circumference of the wheel and so arranged that the parts can be drawn together, rigidly fastening the tire to the felly. This the court regarded as "a positive element in the complainant's device which is lacking in that of the respondent, so that it is impossible to charge infringement."

"In lieu of this continuous clamping device," the decision declared, "the respondent relies on such construction of the U-shaped tire that, in connection with the inflation to which it may be subject in the respondent's method of construction, it holds itself in place without the continuous band. It is true that at certain intervals, following each other around the respondent's wheel, he has staybolts, or lugs, extending transversely from one of the horseshoe ends of the U-shaped tire to the other, which reenforces the tendency of the tire to maintain itself in position. It cannot be doubted that, under some conditions with reference to the invention of the character involved here, the field of equivalents would be so broad that these staybolts might be held to infringe; but, under the circumstances which we have explained, we are compelled to agree with the conclusion reached by the Circuit court."

Patent No. 466,577 was issued January 5, 1892, to Frank Schrader, of Philadelphia, Pa., and is not to be confused with patents in any way connected with the construction and use of the Schrader valves.

Timken Takes a Detroit Factory.

By the purchase of a large factory in Detroit, Mich., which is to be used exclusively for the manufacture of automobile front and rear axles, the Timken Roller Bearing Axle Co., of Canton, O., has expanded its production facilities to meet the increasing demand. The new plant, on Clark avenue, occupies about three acres and was formerly occupied by the Standard Sanitary Mfg. Co. Devoted entirely to the making of Timken roller bearing axles, it will probably be the largest factory of its kind in the world. The company's plant at Canton will be retined.

LICENSED MAKERS CUT A MELON

Dividend of $50,000 for the Members of the Association—Clifton Talks of Conditions Abroad.

Melon cutting was the chief ceremony at the meeting of the Association of Licensed Automobile Manufacturers board members, which was held in New York on the 7th inst. From the reserve fund of the association the sum of $50,000 was drawn, for distribution as a dividend to the concerns constituting the membership. The balance of the session was devoted to reports on show and tariff matters, and to remarks on the European situation by recent visitors abroad who as manufacturers themselves were able to observe trade conditions clearly. The report of the show committee, by its chairman, Col. Pope, indicated that all the preparatory work had been done absolutely to schedule and that all is in readiness for the affair. For the tariff committee of the Associate Automobile Manufacturers, Chairman Joy reported that the automobile tariff brief submitted recently to the Ways and Means Committee of the Lower House of Congress had been well received. Plans have been made to give the brief wide distribution throughout the country.

In addressing the members of the board concerning European trade and conditions, Colonel Clifton, the presiding officer, said that there had been a distinct falling off in the demand for machines abroad. With a few exceptions, he said, the foreign factories are relatively inactive, while positive apathy was indicated at the Olympia show in London and at the Paris Salon, the exhibitors not even putting their best foot forward. Companies which two years ago were flooded with business are now doing comparatively little, and deferred fiscal reports are the order of the day. In conclusion he declared that scarcely a wheel has been turned in some factories which have only recently

Digitized by Google

been rushed to completion. Following Colonel Clifton, another returned member stated that in France at the present time on the typical roads out of Paris low-powered cars are vastly more numerous than high powered machines. In England, on the contrary, the high powered cars predominate, a possible reason being suggested in the fact that the crooked roads require cars that can be quickly accelerated. He also observed that the roads in France, which were not built originally for automobiles, have deteriorated materially.

What Americans Learned at Paris Salon.

European chassis and body design for this year, as revealed at the foreign exhibitions, were given close scrutiny by many American designers, manufacturers and body makers, respectively. Imitation of American construction was discovered by J. D. Maxwell, of the Maxwell-Briscoe Motor Co., on his tour of the automobile factories followed by a visit to the Paris show. He is also of the opinion that the foreign makers have not yet mastered the production of automobiles in large quantities.

"Everyone who has followed foreign practice knows that the planetary transmission was rather sniffed at abroad," he says; "yet this year at the Paris Salon several concerns use it for the first time on light machines—a type of transmission which is entirely American and one that we have used on runabouts in this country with success for years. The shaft drive, which has been popular on this side for five years, is slowly displacing the chain abroad. I found only two factories running at full capacity, the majority having largely reduced their production. In the cars themselves the Paris Salon was a great disappointment so far as advanced designing features are concerned."

Hinsdale Smith, president of the Springfield Metal Body Co., of Springfield, Mass., and technically qualified to judge, found no radical body innovations either at the Paris show or at the factories. Such new ideas as were disclosed were in the nature of detail refinements and improvements, many of them of such worth, however, that they will be incorporated in his product in the future.

Souther to be Consulting Engineer.

Supplementing its established testing department, the Standard Roller Bearing Co., of Philadelphia, Pa., has secured Henry Souther, of Hartford, Conn., to devote a large measure of his time to its interests as consulting engineer. The arrangement is in connection with extensive further plans for the future betterment of the company's products.

Burton Must Not Use Mosler's Names.

An injunction was granted to the A. R. Mosler Co., of New York City, against Ralph Burton, of Peru, Ind., in the United States Circuit court at Indianapolis, Ind., on the 2d inst. The injunction restrains the defendant from using any portion of the words "Spitfire" or "Mosler" on spark plugs, porcelains or the boxes in which they are packed, and also enjoins his agents and salesmen from disposing of any of his products so labeled. Burton is also in difficulties with the Rajah Auto Supply Co., of Bloomfield, N. J., and with C. A. Mezger, of New York, in similar cases.

Walter Renamed Roebling-Planche.

As a sequel to some widely-heralded private but sensational speed trials of a new car, the Walter Automobile Co., of New Jersey, located at Trenton, is to change its name to the Roebling-Planche Co. The Roebling part of the name represents the financial interests which have backed the concern while Planche is the designer of the three new models which the company will make for the coming season. Heading the list is a racing model, listed at $10,000 and guaranteed to give a speed of 105 miles per hour. The other two models are a 20-30 tonneau or laundau at $3,500, and a 50 horsepower model to sell at $5,000 and supplied in touring car or runabout body.

British Visitors Coming Across.

Albert Brown, managing director of Brown Brothers, Ltd., London, has sailed for one of his periodical visits to this country and will arrive the latter part of this week. While in New York he will make his headquarters at the Hoffman House. His firm already handles Gabriel horns and other American motor specialties and he will on this visit be glad to see any novelties likely to be of use for the British market. Another British visitor will be George W. Houck, of London, who promises to be an early arrival.

Reo Branch Factory for Canada.

Another American automobile manufacturer has started a branch factory in Canada in preparation for the broadening of the Canadian market. The Reo Motor Car Co., of Lansing, Mich., has secured extensive manufacturing space in the Medbury building in Windsor, Ont., the small city opposite Detroit, Mich. Work is being pushed rapidly with a view to having the factory in full operation in a few weeks.

Continental Now Wholly American.

All the German holdings in the Continental Caoutchouc Co., of New York City, have been purchased by American stockholders, thus eliminating the Hanover interests entirely. As a result, all Continental tires and materials will hereafter be manufactured and marketed by American interests only.

Auto-Car Plans Big New Factory.

The Auto-Car Equipment Co., of Buffalo, N. Y., makers of electric trucks, have purchased a tract of 12 acres at Elmwood and Hertel streets, Buffalo, and have completed plans for a new factory. The main building will be two stories high, of factory construction using brick, steel and concrete. It will cost $35,000 and will be supplemented by several minor buildings.

Toledo Motor Buys Pope Motor Car.

The Toledo Motor Co., all the capital stock of which is owned by the new Pope Mfg. Co., of Hartford, Conn., and of which A. L. Pope is the president, has purchased the property and assets of the Pope Motor Car Co., of Toledo, O. The sale was made absolute on the 11th inst. by Judge Robert W. Taylor of the Federal court. The receivers of the old company were directed by the court to pay in full all the approved claims of the creditors and the checks were accordingly mailed this week. Upon completing the final details of their work the receivers will be discharged.

At the hearing no opposition to the sale was offered either by creditors or other parties in interest. The Toledo Motor Co. was directed to notify all creditors of the old company having unproved claims that the latter must be filed by February 10th in order to be heard for proof before a referee in Cleveland, O., on February 15th.

E. V. Receivers Report Business Activity.

Receivers Barrett and Nuckols of the Electric Vehicle Co., of Hartford, Conn., in their report for December, which has just been filed with the court, indicate great activity at the company's factory by a pay roll for the month amounting to $29,518.52, while purchases of material amounting to $26,283.65 are recorded. The receipts for the month were $41,499.11, while the disbursements were $55,122.46, leaving a cash balance of $141,812 including the $90,000 recently deposited in New York for the benefit of the creditors.

Oscar Lear Increases Capital to $250,000.

Increased capital for the Oscar Lear Automobile Co., of Springfield, O., was decided upon at a meeting of the stockholders on the 4th inst., in accordance with the recommendations of a special committee. The capitalization will therefore be increased from $200,000 to $250,000, the additional stock being in preferred shares. The directors elected at the meeting were H. S. Bradley, H. J. Rober, John J. Hoppes, Arthur Worthington and Oscar Lear.

American Auto to Vote on Dissolution.

Stockholders of the American Auto Co. have been called to meet on February 1 in the American Trust building, Cleveland, O. The meeting is to vote on the dissolution of the corporation, the surrender of the charter and the distribution of the assets.

Engineers to Have Their Own Office.

The Society of Automobile Engineers has decided to open an office of its own in New York City. The new headquarters will be in charge of Charles B. Hayward, the secretary, who has severed his journalistic connection.

WHAT CONSTITUTES THE JOBBER

Existing Tangles in His Relations with Manufacturer and Dealer—Representative Jobbers Express Views.

In the scramble for automobile accessory business there has been a slap-dash, catch-as-catch-can sort of spirit on the part of both the manufacturers and the jobbers that has mussed the situation considerably and has created some tangles that appear to need straightening out. The manufacturers of accessories are accused of being too free with jobbers' prices in placing goods with retail dealers, while the manufacturers declare that jobbers are becoming retailers and retailers turning into jobbers in such a way that it is almost impossible to tell who really is a jobber.

"Quantity makes the price," according to the sales departments of several of the accessory people, and they make no bothersome scrutiny into the exact jobbing status of the customer provided they are sure he can pay for the goods. It is a case of a "bird in the hand" with them, and no substantial quantity orders will be turned down or kept waiting in order to find out whether the buyer is going to sell the goods directly at retail or to dealers. There are people ready to tell them that they are all wrong, but they confess that the finer ethics of dealing with the jobbing trade have not brought them any money as yet and that they are going to make sure of their orders as they go along and can get them.

Other makers have a half-hearted respect for the trade recognition of a difference between a jobber and a retail dealer. If a dealer seems a likely customer for even a fair quantity and he insists upon the "lowest possible price," he is asked whether or not he is a jobber. Very likely he is bright enough to declare himself all kinds of a jobber, "doing business throughout this territory." Nothing more is necessary, and the eager salesman for the manufacturer will come down to jobbers' bed-rock to land the order. If, however, the dealer is not brazen enough to assert himself as a jobber, he may be helped along by the manufacturer's salesman with some such suggestion as "Well, you could job a quantity of these through your territory if you wanted to, couldn't you?" Naturally he could. In that case the manufacturer will do what he can for him as a jobber, without sticking for the mere technicality of the customer actually doing a jobbing business.

Then there are the busy makers who intend to keep the lines between their dealers' and jobbers' prices quite distinct, but who are easily bluffed, even to the extent of filling small orders at the jobbers' prices.

The would-be customer writes in and says that he is a jobber. His letterhead also proclaims the fact. The manufacturer assumes that it is all true, and cheerfully fills an order for 1-12 dozen at the jobbers' price, without stopping to investigate anything except the credit side of the transaction.

Against these three classes of manufacturers the bona-fide jobbers have serious grievances. On single orders quantity should not make price, they believe. Cut price mail order houses, small pools or buying clubs of dealers or owners, and other undesirable elements in the business are encouraged by the manufacturer who is blind to all of a customers' defects provided he furnishes a quantity order with sure payment. However, when a manufacturer takes this position boldly and openly, the jobbers are at least satisfied as to where he stands. If they need his goods it is a simple matter to get one of their number to buy the quantity insisted upon, afterward dividing it up among the others in small parcels, so that each gets the bottom price without any very heavy investment.

But the maker whose salesmen go around the country discovering or creating new jobbers all the time is the one whom the real jobbers curse with fervor. The newfound jobbers do not amount to anything as additional competition in the actual jobbing field, but they are thorns in the side of the real jobbers by the way they divide up their purchases with other dealers at cost, to avoid carrying too much stock, and they make the real jobbers' salesmen feel very cheap by informing them haughtily, "Why, we can buy from the manufacturers just as cheaply as you can!"

In the ordinary course of affairs, the big jobber in a territory has been the first to be approached by the manufacturer's salesman. The latter has assured the jobbing house that the goods in question are to have a large sale during the succeeding season and that it is advisable to carry a good stock. In consideration for a liberal order, the salesman makes what is understood as the bottom jobbers' price, allowing a good margin for subsequent sale to the dealers. Having landed all the big orders that are possible in this way, the salesman begins digging up the lesser fry in the territory. Most of these have been in the mind's eye of the big jobber as the probable customers for the goods, but the manufacturer's salesman, as orders get slimmer, becomes very lenient in his attitude and, in order to do business which he thinks is required of him, makes propositions to the smaller houses by which they get as good terms as the big jobber without being required to take as great a quantity. When the big jobber gets around to offer the goods to his customers, he finds that many of those on whom he relied to take the largest quantities have by the magic imagination of the manufacturer's salesman been converted into jobbers, too, and that they already enjoy a much lower price than the big jobber can offer. As a result, the bona-fide jobber does not do the business that he expected to do and in some instances is left with a heavy stock of the goods on his hands at the end of the season.

Many of the dealers who have suddenly discovered themselves to be jobbers through overzeal of a manufacturer's salesman, have been sufficiently wise to make each concession in price which they have thus obtained, the basis for concessions from other manufacturers. In contending with a manufacturer as to whether they are entitled to the jobbers' price, they prove their case by citing the other manufacturers from whom they do obtain the jobbers' prices, an argument which is of great effect in many cases. It may be said that there are hundreds of big dealers throughout the country who get a majority of their accessory stock at jobbers' prices without jobbing so much as a cotter-pin during an entire season. Each price concession that they get is made a club for inducing other manufacturers to recognize them as jobbers, and in the face of a strong showing, the manufacturer's salesman is likely to put in a plea with his firm, urging that the concession be made.

It is through the discovery by dealers that in the pose of jobbers they can get better prices, that the careless manufacturers are deceived by the letter head proclamations. Without being guilty of any sophistry or intentional bad faith in making jobbers out of ordinary dealers for the purpose of giving low prices and placing the goods, the careless manufacturer fills almost any order that comes, and grants the jobbers' price simply because the man who orders declares himself to be a jobber. In such cases not even quantity is insisted upon, thus making the situation worse than ever for the bona-fide jobber.

"We haven't time to examine into every little order that comes in," the careless manufacturer says. "If a man is a jobber, and it so appears on his stationary and order blanks, we cannot send an agent out to look over his books and prove it before we ship him. We are busy and we've got to take a chance rather than turn down an order and have a fight over it."

Pretty soon about the only "jobbers" orders that such a manufacturer gets are from the near-jobbers, and the quantity orders are woefully lacking. It is but a natural penalty, and follows as sure as day follows night, for the simple reason that the real jobbers' market for the goods is knocked out and there is no sense in carrying the stock.

Probably nothing is more important for the continued success of an accessory manufacturer than a well conceived and fixed selling policy covering the relations with jobbers, dealers and the public, respectively, as well as the prices to automobile makers using the goods as equipment. This principle is recognized by the shrewdest sales managers in the business. The most prosperous accessory firms, where they give a jobbers' price at all, are careful to see that it is enjoyed only by the real jobbers, since otherwise the whole structure of their

Digitized by Google

selling system must tumble because of basic weakness.

Particularly hard for a new manufacturer, however, is the task of deciding who is and who is not a jobber. The experiences of some accessory makers in endeavoring to make the identification have been trying in the extreme. There are only about a dozen houses in the whole country that every one will agree on as being bona-fide, legitimate jobbers. Some that two years ago were undoubtedly big jobbers have changed the character of their business to such an extent as to be chiefly cut-price catalog houses seeking business by mail from retail customers and doing a retail business over the counter in branch stores. Others have let the jobbing department of their business go by the board to such an extent that they can hardly be considered jobbers any longer, while newer firms have taken up the jobbing end with such enthusiasm and enterprise as to be graduates from the near-jobber class to the real thing.

Some houses there are that perform all the functions of a jobber for certain manufacturers, without doing a general jobbing business at all. As distributors for certain lines of goods they are very successful, and the manufacturers of these particular lines feel well satisfied to give them the jobbing prices. For the manufacturers to enter any definite agreement to recognize only a selected list as jobbers would probably entail cutting off some of these firms, which a few of the makers would be loath to do.

Those manufacturers who agree that the jobber performs a valuable service in the trade so far as distributing goods, saving freight charges to the retailer and assuming the trouble and risk of dealers' credits, must shortly feel the pressing necessity of taking some steps to give the bona-fide jobbers the protection which they have a right to expect. The business is settling down to a firmer basis and conditions will require that those who have not already met and answered the problems which are presented as to selling policy must soon do so.

Perhaps as illuminating suggestions as any concerning the proper method of deterbining who the real jobbers are, come from the big jobbing houses themselves. In response to queries put by the Motor World on this and other points as to the relations of manufacturers and jobbers, the following responses, among others, have been received:

The Motor Car Equipment Co., New York City—"The sore spot in the business is the way the manufacturer is treating the jobber. There is no protection. Some manufacturers consider every dealer a jobber; others do not recognize the jobber, but make quantity prices. It is certainly up to the jobbers themselves to eliminate these objectionable features and organize.

"Our definition of a jobber is: A house buying from a manufacturer, issuing a catalog, having men on the road, and selling to dealers.

"The automobile supply business has come in for a whole lot of abuse from outsiders. It has given an impression that the profits are enormous on account of the fictitious list prices put on merchandise by some manufacturers. There should never be more than 40 per cent. between the selling prices and the prices to the jobber. If this were strictly lived up to, the parasites of the business—cut-price houses, mail order houses, etc.—could not live."

The Post & Lester Co., Hartford, Conn.—"Manufacturers are altogether too ready to give jobbing prices to retail dealers who may have the word 'jobber' printed on their letterhead. There are very few manufacturers who investigate whether a dealer is a jobber or not. His 'say-so' is sufficient as they figure it takes off the curse.

"The remedy would be in the hands of the jobbers, if they could submerge their jealousy long enough to get together and work in harmony. It is the writer's opinion, however, that it would be impossible for such an association to work together in harmony.

"It is entirely in the hands of the accessories manufacturers to protect the legitimate jobber. We do not believe it would be very difficult for them to formulate a list of those entitled to jobbing prices, similar to the list adopted by the chain manufacturers and let the members of the association each sell such jobbers on this list. Similar associations in other lines decide who the legitimate jobbers are and sell them accordingly."

Abbott Automobile Co., Ltd., New Orleans, La.—"If the jobbers have any kick coming at all it is our opinion that they are as much to blame for it as any one else; in fact, more. The legitimate jobbers experience little trouble, in our opinion, in working with the legitimate dealer. One of the most serious troubles being experienced to-day, we think, is the jobber selling in competition with the retailer, direct to the consumers. We know whereof we speak, because we do both a retail and a jobbing business.

"We should define a jobber as being one who supplies the retail dealer with goods in his line and gives the usual dealers' prices on such goods. To be considered a jobber, one should have an established trade with some of the dealers in his territory. He should issue a catalogue, or circulars at any rate, describing the lines which he carries and he should carry in stock enough goods in the line to take care of the demand in his territory.

"There are, doubtless, retail dealers in some localities who are using larger quantities of merchandise than jobbers in other localities, due of course, to the natural conditions existing in their respective territories. So that a jobber cannot, of course, be determined entirely by the volume of business which he does."

New York Sporting Goods Co., New York City—"The automobile supply business is, of course, in a very much jumbled-up condition as to who is and who isn't a jobber, and it will take a few years to clear the atmosphere. I will admit that it is pretty hard now for a manufacturer to distinguish between the wholesaler and retailer, but many of them, in their anxiety to sell goods, display very elastic consciences. The so-called manufacturer's agent is a menace to the jobbers' interests, because what he is looking for is his little commission, and if he can't get the long price from the dealer, he will take the short price.

"One thing is sure, the mail order houses who increase list prices so as to advertise big discounts to deceive the public will find it harder and harder to do business. You can't fool the public very long, and all signs point to the return to the legitimate dealer of such trade as these so-called cut-price houses have diverted."

The Sidney B. Roby Co., Rochester, N. Y.—"There has been entirely too much cutting of prices. We think one of the principal reasons for this cutting is the fact that manufacturers sell indiscriminately to all dealers at jobbers' prices, but compelling the dealer to take a quantity in order to get the price. The dealer is loaded up with more than he would naturally buy and is afraid to let a sale go by so cuts the price to unload.

"We should define a jobber as one who publishes a catalogue, travels at least one man outside of his city, and who at least has one-third of his sales made at wholesale.

"The jobbers themselves cannot organize a remedy unless they have the co-operation of the accessory manufacturers."

Hollis Electric Co., Minneapolis, Minn.—"We are of the opinion that at least 50 per cent. of the concerns listed as jobbers are not entitled to a jobbers' basis.

"In our opinion a concern to be entitled to jobbers' prices should not be engaged in the business of selling or repairing automobiles, but should devote its entire energies to the selling of accessories.

"Although there are a good many houses having the agency of one or more makes of cars for from one to three or even more States, being in touch with a number of dealers handling their particular line of cars, they are not entitled to jobbers' prices as they can secure business from dealers handling their particular line of cars, and not from those who are handling a competing line of cars. The Motor and Accessory Manufacturers, no doubt, could remedy the difficulty."

Hearsey-Willis Co., Indianapolis, Ind.—"Manufacturers of accessories are beginning to recognize the legitimate jobber as one who issues a catalogue, carries a stock of goods and travels men on the road. There are, of course, a great many manufacturers who are eager to market their product and overlook the legitimate market, but will in a short time recognize this

Digitized by Google

when trade conditions will be very greatly improved."

Franco-American Auto & Supply Co., Chicago, Ill.—"We would define a jobber as a man who buys goods in quanaities and in turn sells them at an increase to the dealers who are not in a position to buy quantities and get the price. There is no question but that some action must be taken to protect the jobbers or they will have to enter into the retail business, as about 50 per cent. of the manufacturers work under the idea that everyone is entitled to regular jobbers' discount, which certainly works a hardship on companies attempting to do a legitimate jobbing business."

The Angier Co., Boston, Mass.—"If we were to find fault with the general way in which business has been conducted, we would be inclined to criticize the manufacturer, who, after loading up a jobber for the season, sends his salesman through that jobber's field and deals directly with the dealers from whom the jobber expected to receive his business. Many times these customers are sold at less than regular dealer's price.

"This is a hardship to the jobber who has put capital into a stock necessary to care for the wants of dealers in his territory and is clearly unfair to the jobber. It would seem as though, from a selfish standpoint the manufacturer would feel like strengthening the hand of the jobber in the way of upholding prices for the reason that in one case he deals directly with one party who is presumably able to pay his bills, while in the other he spreads it through a large number of small sales, necessitating expense of travel, putting up, bookkeeping and collections, with increased chances for loss in one direction and another.

"Certainly no jobber who is inclined to uphold prices and do a square business can do so under these conditions, the result being a demoralization and breaking down of prices, so that it becomes a matter of jockeying as to who gets the business, which is not at all agreeable to a high class jobber.

"We define a jobber as a man who issues a catalog covering a substantial territory, and sends salesmen into that territory; or in other words, one who, by direct contact or advertising in some form, reaches the dealer."

The Geo. W. Nock Co., Philadelphia, Pa.—"Until some of the so-called jobbers are eliminated from the list, the legitimate jobbers will have more or less trouble in maintaining prices. The Motor and Accessory Manufacturers do not protect the legitimate jobbers properly, as they are too anxious to get business, no matter where it comes from. It really is hard to define a jobber, but I think it can be done by selecting those who print a catalogue and travel men on the road. This matter will right itself in the course of time, as it did in the bicycle business in years gone by."

CHANGES IN EUROPEAN SITUATION

Indications of the Foreign Shows as Seen by Grossman—He Discovers Some New Things Among Accessories.

Big changes in Europe's automobile situation and the discovery of ingenious developments in improved motor car accessories make the chief features of the observations of Emil Grossman, who has just returned to New York after a visit to both the Stanley and Olympia shows in London and the two Paris shows. Not neglecting the car situation, yet with particular attention to the accessory field, in which, as head of the National Sales Corporation, the Motor Car Equipment Co. and similar enterprises, he is naturally more concerned, Grossman was well repaid for his trip in the knowledge of foreign trade conditions which he reaped and in the new ideas which he was able to pick up, not to mention the closing of numerous important contracts both for the sale of American goods abroad and for the bringing of some of the latest foreign devices to the American market.

"No longer is there any overproduction of high powered cars in Europe," he said, in discussing the results of his trip with a Motor World representative. "The reason is that the foreign manufacturers are not making big cars in such quantities any more. They are turning to small cars. The French manufacturers, especially, are giving a great deal of attention to light voiturettes and to taximeter cabs. Commercial vehicles of all types are being developed rapidly, too.

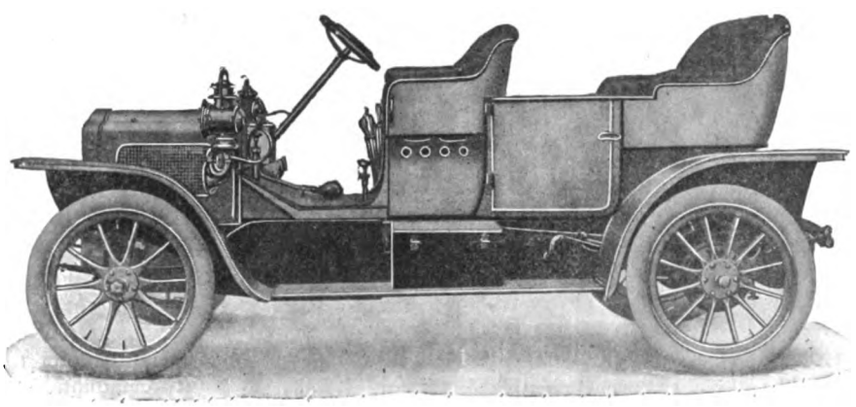
"Big touring cars are only being made in limited amounts, closely calculated to the demand. The French and Italian builders are on about a par in this class, all of them appearing to hold their own. Germany has had no great increase in the number of its automobile plants and seems to absorb pretty near all of its own production. In fact, of all the European automobile manufacturing countries, Germany is probably the healthiest from a business standpoint. All the German factories are quite busy and they do not seem to need to export their cars to find a market.

"Conditions in England are a little more unsettled. There are plenty of British manufacturers, while the makers on the Continent also compete for a share of the business. This results in very lively competition, and while the stronger British makers are doing very well, the weaker ones are having their troubles. The American invasion has not made any very great impression on the European markets as yet, except in the case of two or three well known American makes which have been well represented abroad for some time.

"All over Europe," he continued, turning to the subject of accessories, "there is a tendency to regulate the use of brilliant automobile searchlights in the cities. Legislation has been passed in a great many localities forbidding the glare which ordinarily accompanies the use of gas headlights. To meet the situation almost thousands of devices have been invented for the purpose of cutting off the rays that annoy and temporarily blind traffic coming toward the car. At the shows there were exhibited almost every imaginable form of lamp accessary looking to this end, from movable eclipsing systems, actuated by flexible wires, to fixed arrangements of vanes and light apertures. Of all those that I examined, one in particular struck me as being the most perfect, and I secured the American rights to manufacture it, and through our company will shortly place it on the market."

It consists, he explained, of nothing more than a front glass for the lamp, the upper half of the glass being etched on both sides and inlaid with black bands of enamel. The bands on the two sides are waved, and so arranged that the high parts of the curves come alternately, the light being allowed to go only in a straight forward direction through the interstices of the criss-cross pattern that they make.

On his trip he also bought the American patent rights to manufacture a new form of demountable rim, a product of the Pirelli factory in Italy. The rim differs from the types heretofore shown in that only half of the locking ring for the demountable part is removed when it is desired to take off the latter. Three bolts control the action of the whole arrangement and a change can be made in from 20 to 30 seconds. In England he arranged for the rights to make the Hattersley & Davidson compound pump, of the familiar English type.



Supplanting the earlier forms of universal pump connection abroad, according to Grossman, is a new universal connection, which, instead of using stiff, slotted rubber into which the tire valve fits, has a contracting clamping action which is controlled by a small lever. The device is no larger than the ordinary universal pump connection, but it does not so readily wear out and when slipped on a valve and clamped by the one lever movement, gives no chance for the leakage of air. The same simple mechanism is also incorporated in a valve cap, thus doing away with the usual screw thread and preventing the slow valve leaks which afflict many tire users. The American rights for these two accessories he also obtained, and will manufacture them in large quantities.

A further novelty in his stock of foreign acquisitions is a tire pressure gauge which retains its reading after being removed from the tire. After the reading has remained for reference as long as is desired, the indicating hand may be returned to zero by pressing a button, after which the next reading must be obtained from the air pressure of a tire, as before.

THE WHITE STEAMER IS THE ONLY CAR

of distinctively American design

The White is the only car which is not a copy or an imitation of some foreign product. In almost every class of machinery, American ideas of construction have eventually proved triumphant and so it is with the White Steamer. The White is sold in quantities abroad in competition with the home product and, as regards this country, there are more Whites in use than any other make of large touring car.

The White possesses so many points of superiority over other types of automobiles that any one who purchases a car without first investigating the White is acting with only a partial understanding of the possibilities of automobile construction. We can meet the requirements of almost any pocketbook with either our 20 horse-power car at $2000, (shown above) or our 40 horse-power car at $4000. The United States Government, the most discriminating of purchasers, owns more White Steamers than all other makes combined. Our cars are used by the War, Navy and Executive Departments.

Write for descriptive matter.

Safety as a Selling Slogan.

It is an incident to progress that not simply do the structural features of automobiles change from one year to another but that the points in which they exert their appeal upon the buyer also are constantly undergoing alteration. Thus the salesman finds that it is necessary not simply to learn the general direction to be taken in seeking trade, but that it is further necessary to be shifting his course from time to time in order to keep abreast of the market. A case in point is the way in which the qualities of speed, appearance, power, carrying capacity and endurance have been played upon during successive years. In turn these qualities have come to be regarded almost as a sine qua non in a high grade car, and the resourceful salesman has been forced to change his argument accordingly in order to bring about the conviction that the product which he handles has other qualities than those which are regarded as mere essentials in a well-made and thoroughly approved car.

In this connection it would appear that the marketing of the really high grade machine might be carried out more largely on a basis of safety in addition to the other accepted requisites than generally is done. Cars which may possess many other of the necessary qualifications, occasionally are subject to accidents which point directly to the use of improper factors of safety; to inaccuracies in the design of vital parts of the running gear which result in more or less serious disasters. It seldom happens, however, that among the machines which suffer in such ways are found the names of certain makers whose products are classed among the very best. Above all else they are so constructed that they are safe. Broken axles, dished wheels, steering gears gone wrong at a critical moment and other difficulties of a nature which would tend to imperil the occupants are practically unknown. Therefore the cautious user whose inquiries among his friends are apt to be extremely searching, comes to regard such machines as desirable above all questions of price or speed or capacity or appearance. Indeed, it may be considered as largely because of this happy avoidance of critical failures that certain machines have attained the conspicuous success which they have.

It is no longer a problem of extreme difficulty for a manufacturer to turn out a car to satisfy any or all the demands which have been paramount in former years. All things considered, however, it is difficult to produce a car which is really safe—that is to say, which is figured for strength in every line, and which is built of materials which are thoroughly suitable in every respect. To produce such a car it is necessary to carry out the details of design and construction with the utmost care, to insure the inspection of every part prior to assemblage, to provide for the testing of samples of each new lot of material broken into, and to overlook the process of assemblage with absolute thoroughness. Therefore, the machine which, as a matter of record, is proven to be safe may be regarded properly as having those other qualities which are desired, at least in matters of material and workmanship. Speed, appearance, cost and capacity, the average buyer can determine for himself, but the absolute assurance that the car of his liking also is reliable to the point of absolute safety should go a long way toward fixing his final choice. The salesman who fails to take cognizance of such an advantage would seem to be overlooking one of the most important shafts in his quiver.

Abandoning the Rule o' Thumb.

Rather surprising to the layman is the idea that by merely allowing a tiny little piece of metal with an oddly shaped point in which a diamond is set, to fall a given distance and then observing how high it rebounds, it is possible to determine the hardness of the substance against which the piece rebounded. But further, that by determinations so made, taken in comparison with other determinations previously made and checked; it is possible to secure not only a measure of the hardness of the object under test, but also of the strength and elasticity which it possesses, seems almost beyond comprehension. Even the trained scientist of a few year ago would have scoffed at the notion of applying the results of so minute a test on a greatly magnified scale to data which under other circumstances would be obtainable only at the expense of tremendous physical reactions.

This is the age of the chemist and the physicist, however, and the fruits of their labors are constantly coming to be regarded in a more serious light by those who formerly were wont to regard all questions of pure theory more or less askance, and to depend almost wholly upon empiricism for their guidance. It has come to be recognized that the deductions which the trained analyst is able to make from his own observations and those of others are far more conclusive and accurate than those which the old-time expert could make as a result of his long training in the blunt use of his seven senses. The type of man who is offended at the notion of guiding practice by theory still exists in large numbers, but he is content to put into daily use products which would have been unattainable without the application to practice of the most abstruse and almost amusingly complex of hypotheses.

It is significant of the advancement embodied in the motor vehicle as of the progressive type of men composing the producing industry, that automobile factories utilize some of the most modern and highly theoretical systems in existance, both as to methods and machinery of production and as to the materials utilized. With an enterprise which is characteristic, every avail-

Digitized by Google

able new idea which is applicable in any way to the task of producing a better car, or as good a car under better conditions, is grasped and adapted to the needs of the builder. Inventiveness and clever application of ideas have made possible the design of the modern car. But only through the wholesale adoption of the most advanced systems known to science has it become possible to reproduce those designs in concrete and durable form at a price which has made possible the popularizing of the motor vehicle.

New York City's Park Commissioner has "broke loose" again on the subject of tire chains. Because a short stretch of road which recently he caused to be resurfaced at a cost of $30,000 is again in need of repair, he thinks the use of tire chains should be prohibited by law. But as such chains and other anti-skid devices are in the nature of life-preservers it would seem that any enactment that may curtail their use will strike at the policy of public safety and also at the "first law of nature." The Park Commissioner might better investigate his costs of resurfacing or find a pavement that will not be so easily affected or so quickly require repairs.

It is peculiar what queer ideas of helpfulness are possessed by most of the so-called popular periodicals which bid for the patronage of the automobile industry. Thus Harper's Weekly illuminates its "Automobile Number" with a picture of a perplexed motorist laboring on his disabled car and exclaiming, "How I wish you were a horse!" Life's "Buzz-wagon number," which is overflowing with automobile ads., is studded also with illustrations of motorists in distress that are not calculated to induce pleasing thoughts of motor cars nor to promote their sale.

As both an outlet for American accessories and the source of new accessories for the American market, Europe looms larger every year, no matter how much it has declined from the pre-eminence in complete cars which it at one time enjoyed. What Europe is doing in automobile design and manufacture is now of comparatively little importance to the American industry, but in the accessory field a trans-Atlantic exchange of both ideas and goods is being conducted with increasing profit to those interested, on both sides of the ocean.

MOTOR CARS SAVE STREET SPACE

Comparisons with Horse-drawn Vehicles—What the Measurements Proved—London's Horses Disappearing.

Of the advantages accruing from the use of the motor vehicle in cities, perhaps none is more vital to the life of the greater municipalities than that arising from the economy of space involved and the relief of traffic congestion which it brings about. Suggestive figures bearing upon this point are contained in a report recently published by the London traffic branch of the Board of Trade on conditions in London, wherein it is shown that between 1903 and 1907 the number of motor cabs had increased by 700, while the horse drawn cabs had decreased in number by more than 1,500. Motor 'buses had increased during the same period by 1,200, while the corresponding horse-drawn vehicles decreased by 1,000.

The figures are authoritative, being drawn from the reports of the granting of annual licenses. Their full significance does not appear, however, until comparison is made of the relative amounts of space occupied by motor and animal traffic. Such a comparison made by the Geo. N. Pierce Co., reveal striking contrasts. Thus in the case of a 6-cylinder 60 horsepower car, seating seven passengers, 72.8 square feet of street are required, while a one-horse cab occupies no less than 88.7 square feet. This saving of 15.9 square feet is eclipsed in the case of the smaller 24 horsepower car which conforms more closely in seating capacity with the cab. The car in question occupies but 59.1 square feet, a saving of 28.6 square feet. The complete results of the measurements are as follows:

Motor Vehicles.

H.P.	Length over all.	Sq. feet.
24	12 feet 8 inches	59.1
36	13 " 0 "	60.7
40	14 " 5 "	67.0
48	15 " 0 "	70.0
60	15 " 7 "	72.8
45	18 " 6 "	84.0

With the exception of the last, which was a 5-ton motor truck, the cars measured were of the pleasure type. The horsed vehicles chosen, however, were of the varieties more commonly found in city traffic, as follows:

	Length over all. Feet.	Sq. feet.
One horse cab	19	88.7
Two horse cab	20	93.3
One horse del. wagon.	20	93.3
Two horse del. wagon.	20	93.3
Moving van	24	112.0
Brewery wagon	26	121.1
Scenery wagon (short)	29	135.3
Scenery wagon (long).	40	228.7

An even more striking illustration is that furnished by comparison of relative street areas occupied by the big motor truck and its nearest animal drawn equivalent, the brewery truck. The latter, while not capable of carrying as great a load as the motor vehicle in question, occupies 121.1 square feet of street space, while the motor truck requires only 84 square feet.

COMING EVENTS

When in 1905 New York for the first time beheld the spectacle of two great automobile shows held simultaneously, the innovation was hailed with delight, for New York and New Yorkers never weary of a spectacle, no matter what its subject or object. At the same time, it was held by some that two shows must be one show too many; that whether they were held simultaneously or on closely related dates it would be found that the local public would tire of tramping the aisles and inspecting the externals of the vehicles, while of the out-of-town contingent upon which so much dependence always is placed by the exhibiting manufacturers, the notion was entertained that the dual show proposition would result merely in splitting the attendance, as it were with the result that neither show would receive its full share.

The sequel has amply proven the fallacy of the idea. Instead of becoming weary of the show, the public appears to anticipate it with increasing eagerness from year to year, while the numbers of visitors at the first and second exhibitions each year appears to be constantly increasing in numbers, as in intelligence and interest. How successful the duplication of shows has been from the manufacturers' point of view, may be judged from the eagerness with which the allotment of spaces is awaited, and the prosperous conditions which prevail immediately after the show, when there is afforded sufficient breathing space to cast up accounts.

Because of the associations and traditions surrounding Madison Square Garden—the birthplace of American automobile shows—all Garden Shows are looked upon with particular favor. Whether by virtue of the fact that repeated efforts have lent wisdom to the brain and craftiness to the hand of the decorator in increasing amounts from year to year, or whether from happy coincidence, the setting of each of the shows held in the big arena and its surrounding halls has eclipsed its predecessor. In token of the march of improvement, naturally the importance and value of the exhibits it has enclosed also has increased annually.

Saturday, January 23.
Meeting of the A. A. A Legislative Board, 10:30 a. m.

During the week, meetings of the executive committees of the Association of Licensed Automobile Manufacturers and American Motor Car Manufacturers' Association will be held, dates to be announced later.

That the show of the Association of Licensed Automobile Manufacturers, which is to open on Saturday evening next, gives all promise of following precedent in this respect, is beyond question. What is vulgarly known as the "licensed" product, has become thoroughly standardized by reason of the close study of the members of the mechanical branch of the association, and so is entitled to respectful attention on every occasion. At the same time, that standardization has brought about none of the loss of individuality among the cars produced by the various firms such as a monopolistic rather than a co-operativee regime would have induced. Hence the idea of standardization in this connection carries with it merely an assurance of mechanical excellence, while also furnishing a practical endorsement of the structural differences which serve to distinguish the features of one make of car on view from those of another.

With the conclusion last Thursday of the first of the New York Shows of the present season was brought to a climax one of the most significant expositions ever held, because of the generous tokens of renewed prosperity in the section of the industry there represented. As a spectacle pure and simple, moreover, it was of immense value because of the versatility displayed by the manufacturers who were represented.

The forthcoming show, in no sense a sequel to it, promises further revelations in matters of design, additional advantages in the way of exhibition facilities because of the supreme utility of the Garden for show purposes, and a display of machines produced by some of the oldest and most experienced builders in the country, many of whom have occupied stands in the arena or on the elevated platforms since the very beginning of the American industry as an appreciable factor in the business of automobile construction.

Strange contrasts might be drawn between this, and the first show of its kind, which opened in the same arena on January 3, 1900. With decorations provided only by the exhibitors, and only in restricted and modest amounts, with shaky and uncertain

Digitized by Google

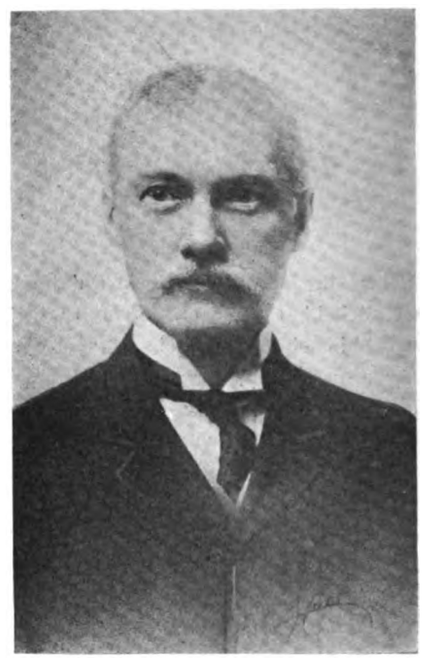
vehicles on view, and a little band of accessory makers backing up those who had the temerity to display complete vehicles. The center of interest was the main floor,

E. P. CHALFANT
General Manager A. L. A. M.

where was constructed a testing track upon which all demonstrations took place. Demonstrations sometimes proving of the sort not anticipated by the exhibitors, the time between whiles when mechanics were tinker-

M. L. DOWNS
Secretary Show Committee

ing with various obstinate devices, were filled in with gymkhana events and mild contests to show the starting, not to mention the stopping proclivities of the machines. As is the case this year, there were no foreign exhibitors at the first of the shows, but instead a number of foreign-built cars, privately owned, were exhibited as curiosities in the restaurant, now given over to the then unheard of electric vehicle. No better proof of the advancement of the art could be required than that the importance of the show demonstration has dwindled from year to year until now, though still a vital feature of the manufacturers' show campaign, it is no longer required by the possible buyer as evidence that the vehicles displayed are of practical usefulness.



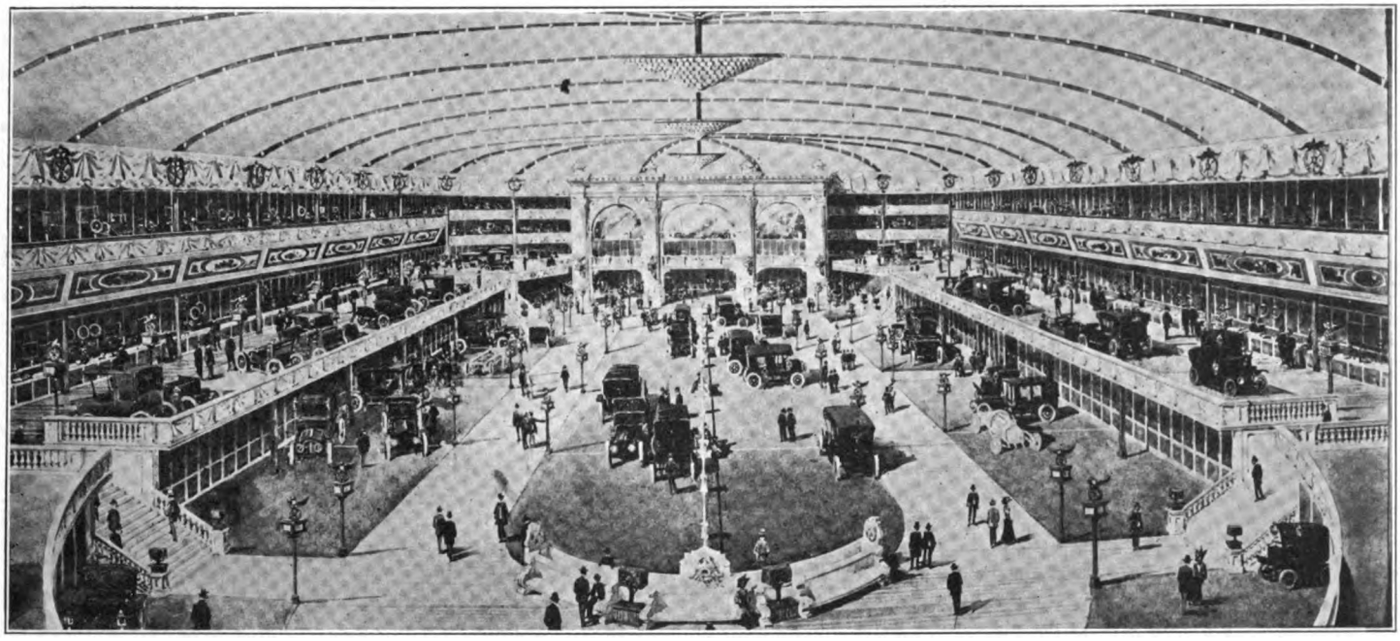
As experience in the conduct of its successive annual shows has profited the A. L. A. M. greatly, so it has proved advantageous to retain at least a portion of the management from year to year. The show committee under whose direct guidance the

COL. GEORGE POPE
Chairman Show Committee

tasks of preparation and administration fall is of well tried material with an infusion of new blood as well. Col. George Pope has been chairman of the show committee for three successive years. President Charles Clifton, of the association, serves ex-officio. E. P. Chalfant, the new general manager of the association, is serving on the committee for the first time, while M. L. Downs, its secretary, has been identified with the A. L. A. M. for the past five years and has attended to the detail work in connection with all the shows. Coker F. Clarkson, secretary of the mechanical branch of the association, and also the new head of the publicity department, though not a member of the show committee, has been prominently identified with it, particularly in the important service of the necessary advance work.

No adequate conception of the task which awaits even the most efficient and capable show committee can be obtained until comparison is made of the show building before the active work of dressing it for the occasion has commenced and after it is complete and the show is ready for the

CHARLES CLIFTON
President A. L. A. M.



public. It is not alone the immensity of the undertaking; the necessity of arranging for the complete disguising and beautifying of bare walls and unattractive floor spaces within a limited time, but the symbolism

COKER F. CLARKSON
Head of Publicity Department

which it carries of the work of shaping the great display in all its details, first of gathering in the makers and their wares, and then of gathering in the public, which is

Digitized by Google

VIEW OF MADISON SQUARE GARDEN, SHOWING SCHEME OF DECORATION FOR THE SHOW

impressive. Yet vast as the undertaking is in all its phases, it is to the embellishment of the building itself, that the visitor is apt to look in order to determine whether the committee has outdone itself in originality and enterprise. Variety, attractiveness, harmony and above all, unobtrusiveness are pursued with earnest fidelity in an effort to make the show as impressive as possible, and to do so with increasing success in succeeding years, is more of an achievement than is commonly appreciated.

For this year, the effort has been to create an impression of expansiveness in the arena itself, while the other departments have each received their customary individual treatment. No obstructing screen or other decoration mars the view of the visitor entering the arena for the first time. Instead, the plan adopted calls for a full view of the entire floor culminating in a huge triumphal arch at the far end, 87 by 48 feet in external dimensions, of classical architectural design, and backed by large mirrors which are intended to give the effect of added depth to the view. Directly in front of the entrance, and marking the branching of the aisles to the longitudinal concourse on either side, will be a sort of Garden fountain, in the form of a low abutment of gray stone, curving about the first exhibition spaces facing the entrance. It will have a trough-like basin, into which water from griffin mouths will spray upon the electrically lighted pool beneath. In the pool will be gold fish and pond lilies, some of the lilies natural and some artificial. From the artificial flowers electric lights will radiate, while a concealed row of lights under the coping of the trough illuminates the falling spray. Carved into the front wall of the fountain will be seats for visitors, punctured at intervals by bay plants.

The general color scheme is to be brown and white, the floors of the stands being carpeted in green. Decorative lamp posts to mark the divisions between the exhibits, liberal use of the new decorative emblem of the eagle mounted on a wheel bearing the initials of the association, frescoes above the elevated platform depicting appropriate scenes in which the automobile plays an important part, brown burlap panels on the lower walls set off with white bunting draperies, and the same material festooned above, will complete the background against which the cars will be set.

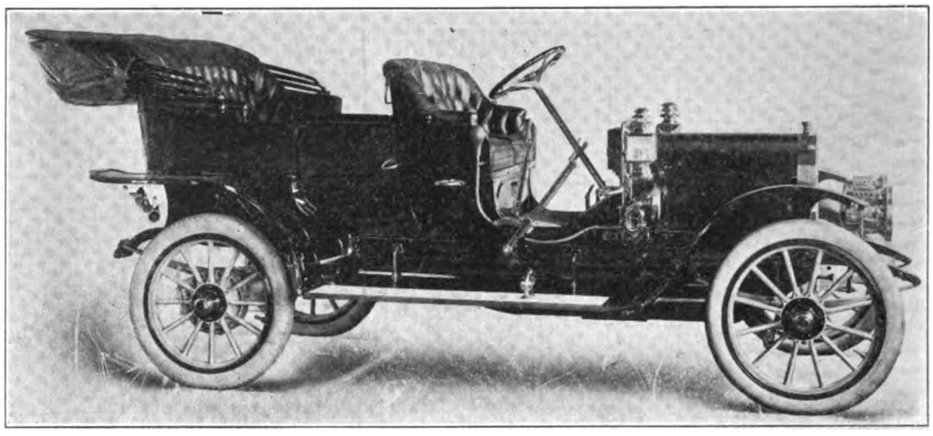
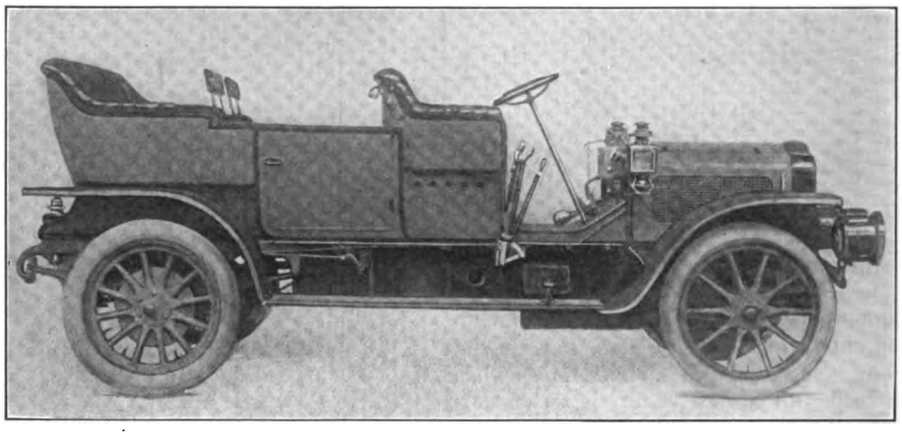
THE RATHSKELLER—A STONE WINE VAULT



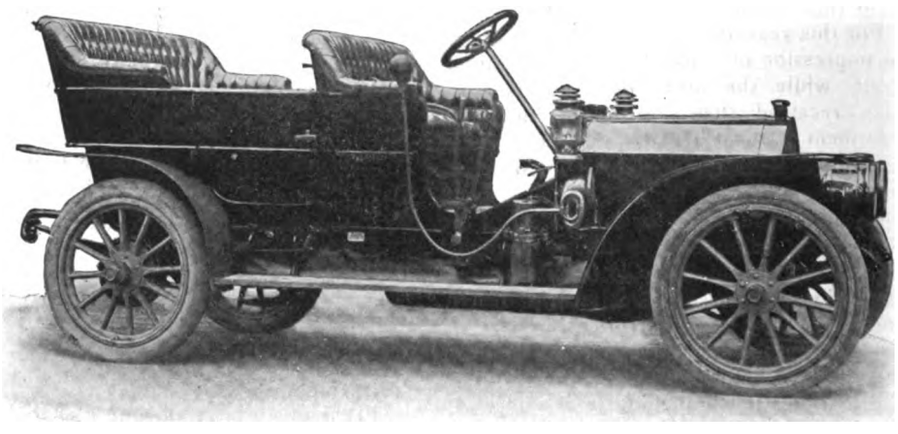
THE EXHIBITION HALL—AN ITALIAN GARDEN

Digitized by Google



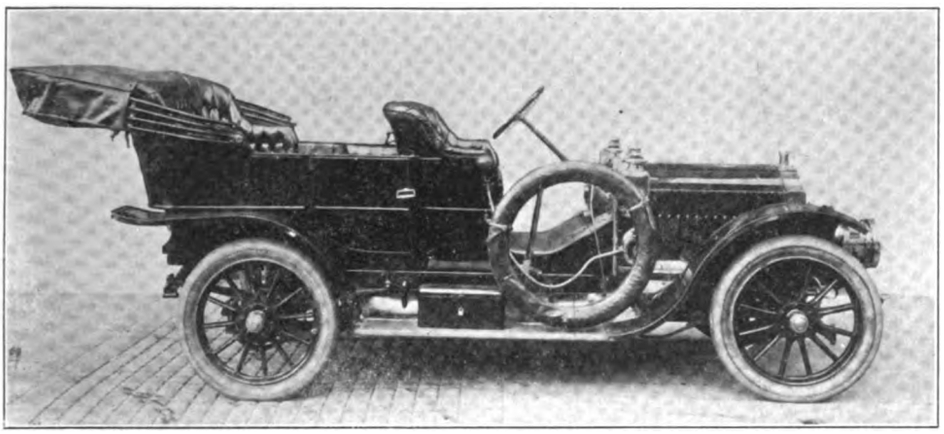
treatment in other sections of the building has given rise to the adoption of the plan for a huge trellis effect in the concert hall, vine-covered and craftily illuminated with concealed electric lights. In the restaurant, the scheme chosen is that of an Italian garden, with realistic walls at the sides, and mural landscapes above, and an overhanging pergola artistically bedecked. The basement is not naturally a place of artistic inspiration, but the quaint setting adopted for the rathskeller is likely to prove effective enough to satisfy the demands of even the most fastidious, with its simulation of an old wine cellar, stone walls, groined arches, casks lining the walls, and iron gateways.

As a show of standardized products almost without exception, the Garden exhibition is not a place for the seeker after startling innovations to find his curiosity rewarded. Originality in the working out of details of construction, however, is to be found in plenty by the close student of automobile design, and to those who are familiar with the construction of cars which have been on view in previous years, sundry changes are discoverable, interesting and instructive, though of comparatively minor importance. In addition to the small refinements of the more stable machines, however, a number of makers will be found to have produced entirely new models for the new year; models posessing sufficient novelty to constitute real "show features." Further, through the official ratification of organizations which have merged older exhibitors, it has been possible for at least two entirely new products to be shown, in addition to which one or two concerns reorganized since the last show, will exhibit cars which are practically new in construction.

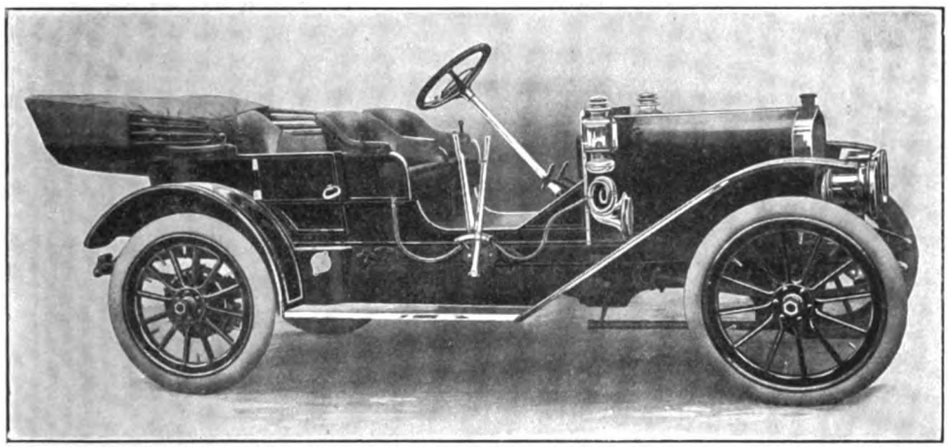


Of the absolute newcomers, no little curiosity will centre about the E-M-F—the hyphenated outcome of the gospel of multiple production which embodies so many of the features of the big elaborate cars, at a price suited to the abilities of the man of moderate means. Technical points in its construction which are likely to meet with approval at the hands of the showgoer are the use of the block method of cylinder formation, with offset crank shaft, thermo-syphon cooling, and magneto ignition; the expanding ring clutch of original design—like the entire machine; the unit transmission, with its change gear and differential housed in common with the rear axle, its pressed steel torque member, semi-floating drive and roller-bearing mounting. The change gear is of the popular selective pattern, and the mechanism of control is further simplified by the use of a foot accelerator. A unique method of steadying the steering gear is found in the method of mounting the front axle, in which the steering pivots are offset back of the yokes in order to produce something of the old-time castor effect, which used to be so much praised in the earlier days of safety bicycle construction. The hubs are mounted on two-point ball bearings—an important point to observe in a product of any such price rating as is given the E-M-F, and throughout the entire machine, the use of pressed steel units combining as many purposes as possible has been made to evidence the careful forethought which has made practicable the production of a car which is in certain respects truly remarkable.

SELDEN "29" TOURING CAR

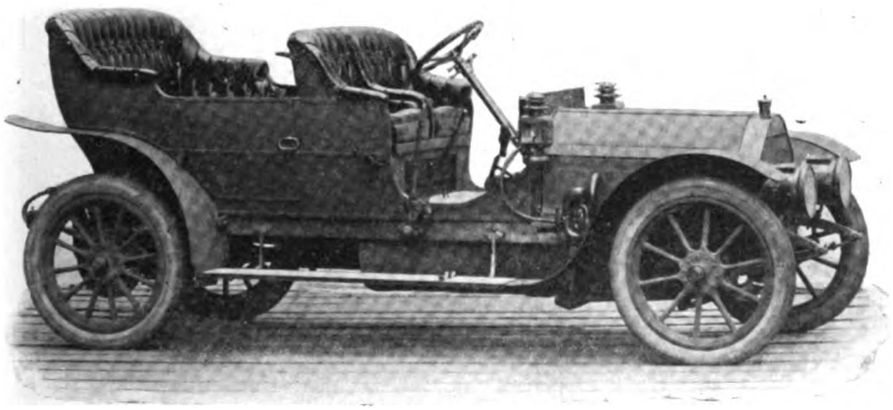


WHITE "M" TOURING CAR



COLUMBIA MARK "48-3" TOURING CAR

Another machine which is calculated to impress the observer because of its closely wrought-out design is the Chalmers-Detroit —also a newcomer at the show—in which is evidenced another laudable and scientific attempt to produce a tremendous increase in value received over that commonly granted at the same figure. Here the principle of the unit power plant has been carried to a logical conclusion, lavish expenditure of expensive fittings, at points where they will repay their cost, being evidenced in the ball bearing mounting of the crank shaft among other noteworthy points. The constant-level, splash system of lubrication is a feature much praised by users who have

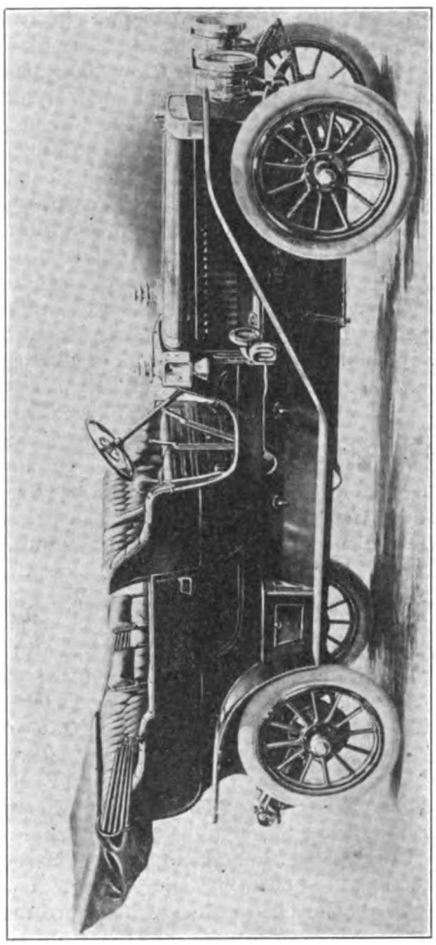


Digitized by Google

ELMORE "33" 2-CYCLE TOURING CAR

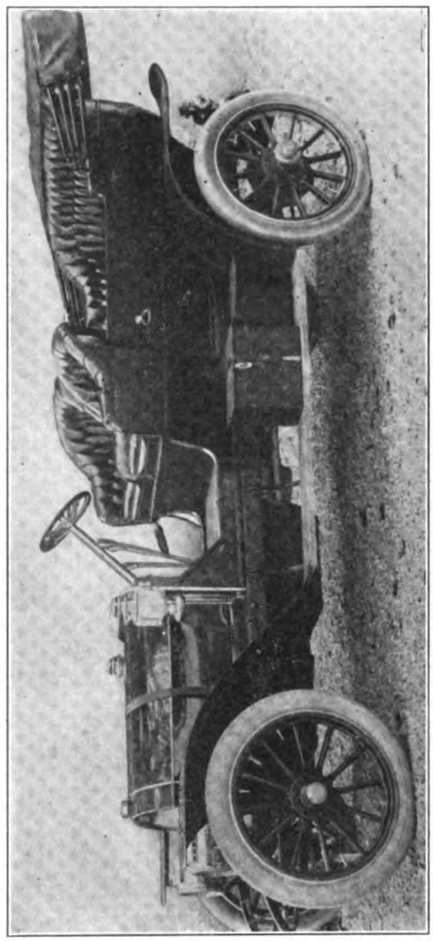
CORBIN "O2" BABY TONNEAU

PIERCE "6-36" TOURING CAR



already become acquainted with the car, while another useful feature is the method of mounting the radiator upon flexible supports in such a way that it cannot possibly be strained to the point of leakage, even when the car is severely stressed over rough highways. Rear axle details worthy of mention are the large annular ball-bearings at every point; the spring-seats swivelled spherically upon the axle tubing to avoid twisting the springs in striking bumps; and the accessibility of every part for inspection or lubrication. The clutch and transmission-brake are both operated by a single pedal. Pressure on this pedal first throws out the multiple disc clutch, while continued movement applies the brake on the drive-shaft. This arrangement leaves the right foot free to operate the throttle. The foot-throttle, instead of a button or lever on which the foot works vertically, is a horizontally swinging lever which permits the driver's foot to rest comfortably on the floor at all times. Another useful feature is the fitting of a rubber bushing in the front eyes of the rear springs where they are anchored rigidly to the frame, thus providing an effective cushion against traction shocks.

Among the new models of machines which bear well-known names, no small amount of interest attaches to the Locomobile "30", which is the first model in which the principle of shaft drive is employed to be turned out by the makers of the last Vanderbilt Cup winner. Contrary to the practice which is fairly general in shaft drive construction, the radius rods are made to take the traction load on these cars, their rear ends also supporting the brakes in such a way that by virtue of their swivelled mounting on the axle tubes, no stresses of any sort are communicated to the axle proper save those due to the dead weight of the vehicle and the side strains of the springs. The plan also relieves the springs of all driving or twisting strains and hence leaves them free to perform their natural function. Further, the mounting of the springs on swivelled chairs or saddles, provides against unequal stressing of their ends, and leaves them in practically floating relation to all except their proper loads. A point in this connection likely to be appreciated by the user is the construction of little lugs on the under sides of the spring saddles to serve as lifting points for the jack when it is necessary to raise the wheels.



In the latest product of the newly organized Pope Manufacturing Co., is to be found a car, duplicating many of the features of the former product which bore the name Pope-Hartford, but unlike it in respect to a number of points which have been deemed remediable by its designer. The motor is of larger size, for instance, its auxiliaries have been rearranged and placed to better advantage than before, and the method of lubrication also has been bettered. Both master clutch and rear axle have been redesigned—the former with regard to the preservation of alignment between its two conical members under all stresses of use and abuse, and the latter with regard to the universal support of the torque member among other points, the absolute floating relation of the rear axle to the remainder of the chassis having been successfully accomplished in an original manner. Increased brake sizes, alterations in the frame and an increase in wheel base are among other changes which have been introduced, while as a matter of course, the body designs are new—nearly all makers still clinging to the notion that an annual overhauling of the body lines is calculated to gratify the purchasers of recent models.

Stevens-Duryea cars are produced in four different models, all of them embodying the principle of the unit power plant with three-point mounting which has been a strong feature of the line for so long, and otherwise incorporating a number of useful and original features. The use of the progressive system of change gear is noteworthy as applying to the entire line, as is the adaptation of a special method of gear finding by a device which is intended to ob-

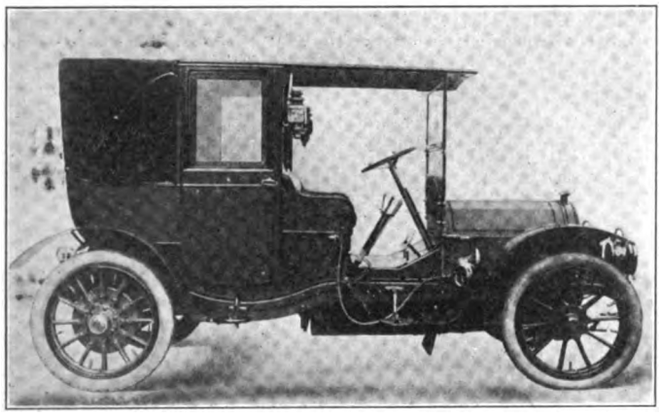
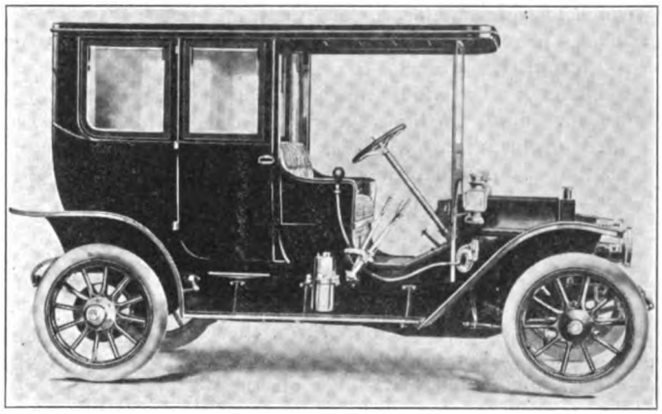
viate many of the difficulties supposed to be attendant on the use of this system. The clutches are of the multiple disc variety and shaft drive is a universal feature. The carburetter is so designed that it automatically takes care of any surplus fuel due to careless handling of the mixture or improper flooding when starting, and is of the single jet type, perfectly automatic in action and intended to furnish a uniform mixture regardless of throttle position, but determined solely by the rate of engine revolution. The lowest point under the car is under the rear axle casing, this being 10 inches above the ground. The fly-wheel cannot be injured by high crossings or ridges in the road, as, being in front, it is raised with the front wheels and carried over the obstruction.



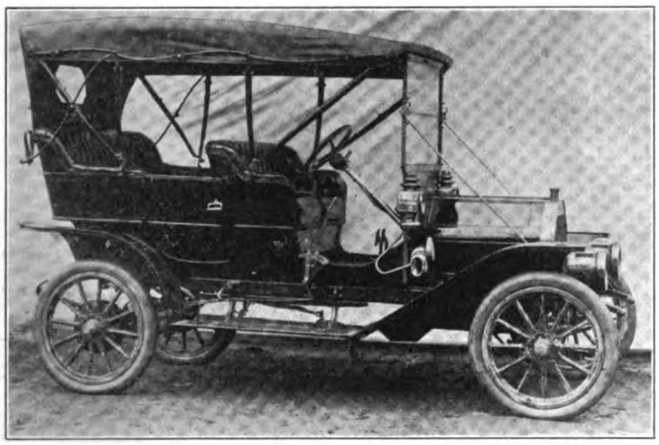
A new car, with a promised new name for the producing concern is that to be exhibited under the name Walter car, but known individually as the Roebling-Planche after the joint names of its financial and technical producers. New features adopted this year include the substitution of platform springs for semi-elliptic members, a 2-inch increase in the diameter of the steering wheel, paired cylinder castings, and a solid aluminum crank case mounted on a three-point suspension, not to mention the employment of a special device for cushioning the radiator against shock by means of a rubber saddle protector are among other refinements, while the manner in which provision is made for the mounting of the dash lamps, tire brackets and other local accessories is likely to excite favorable comment. The car is produced in touring and town car types and also in the form of a high-speed racer.

In the Royal is to be found the product of a newly organized company taking up the work of an older predecessor and presenting a car under the old name, which closely resembles the former product. The motor, however, is larger than before, having a 5½-inch bore, a four-speed selective change-speed gear is used, the wheel-base has been lengthened, and three sets of brakes are mounted, two sets (four shoes) on rear wheels and one on the propeller-snaft. A self-starting device is furnished as an extra. Special features such as body mounting, convenience of the control mechanism, not to mention the ignition system, are also to be observed.



Amog the really sensational announcements of the fall and late summer was that of the new Cadillac "Thirty", which was hailed as a significant innovation to the class of the popular-priced machines. Though "on the road" for some little time, it comes to the show as a new and novel feature, incorporating a number of essentially Cadillac details. Among the points which the visitor will observe in making a study of it are the use of copper water jackets, three-speed selective gearset, shaft drive and rear wheel brakes, with their respective methods of mounting, while such details as the use of ball bearings for the steering pivots, and cooling fan, point to careful supervision of design, while absolute interchangeability is an indisputable feature of the entire line.

Still another new model which falls into the class of the medium powered vehicle is the new Packard "18", which follows the general design of its larger sister car, but is built of smaller proportions for town car and light driving purposes. In the same general class, is also included the new 15-30 horsepower Stearns landaulet, which, as its makers explain, gains its broad rating through the use of a double-jet carburetter, one jet giving sufficient gas to turn up the smaller amount of power, and the other affording the full amount. Unlike the 30-60 horsepower car of the same make, which also is scheduled to appear at the show, it is shaft driven through an enclosing torsion-resisting casing.



Points of interest, picked out at random from the features of the various other exhibitors who are scheduled for the show include the use of the new Simms-Bosch mag-

netic plugs with low tension magneto on the Studebaker cars, and applied to both the 30 and 40 horsepower models; the universal application of the distance-rod construction of the Matheson which, aside from serving the purpose of a strut rod, with provision for universal action, also supports the hill-pawl, the expanding brakes, the emergency-brake lever, and the dust shield, which protects the emergency brakes in the rear wheels from dust and mud.

The rear axle construction of the Apperson, which, besides being of the floating type, makes provision for sufficient "cambre" to permit the wheels to run on a "plumb spoke", thus eliminating any tendency to spreading; the leverage for operating the Corbin clutch, which is now so designed that a 5-pound push on the pedal is sufficient for declutching; the new design of the Elmore clutch mechanism, with the spring placed directly behind the cone; the use of double fly wheels and the rear axle construction in general of the Haynes; the use of magneto with fixed spark on the concentric valve motor of the Franklin; and the use of triple cylinder castings on the new Thomas "6-40" touring car—also are of interest.

From year to year interest in the developments of the electric vehicle makers continues to grow, though at a steady and moderate rate, in keeping with the thoroughly settled condition of that branch of the industry. Because of the policy of the Garden show management of placing the electric vehicles in a department by themselves, where the sharp counter influence of the rapidly shifting constructions employed in gasolene vehicles is removed from them they never show to better advantage. This year the floor will be amply filled with the displays of eight makers.

Among them, that of the S. R. Bailey & Co., Inc., is entirely new to New York, and is destined to provoke no little interest owing to the original methods of design manifested throughout its construction. The use of wheels having all-metal felloes, a swinging steering post which affords a tiller effect in guiding the machine, motor control by a lever mounted on the steering wheel, which is placed at the top of the steering post merely for convenience in handling the car, and the general measure of safety expressed in several "fool-proof ing" devices, are likely to attract attention Other vehicles which will be of especial interest are the Waverley line, which is in the hands of a newly organized company which succeeds to the general scheme of design which has been identified with the name for several years; the R. & L. and Detroit lines, which are comparatively unfamiliar in the East, though well-known to Chicago show goers; and the Electric Vehicle and Studebaker lines.

Another section of the show which is coming to be regarded as of greater impor-

In the Realm of Parts, Accessories and Tires

With the same actors a good stock company is able to produce a new and different play every week, and the accessory exhibitors who will appear at the Garden are preparing to stage a production which will be worthy the patronage of even the most hardened show goer and which will have all the elements of instruction and entertainment claimed by Artemus Ward for his famous, if erratic, "strictly moral" exhibition. Many new additions to the caste, in the way of concerns who did not appear at the Palace, will make the Garden accessory and parts division appear with all the freshness and novelty that can be desired.

As at other shows, tires and ignition apparatus lead all other individual classes of exhibits in the accessory division, followed by the group composed of such things as chains, frames, gears, bearings and parts. Numerous types of speed indicators will be shown, while the more prominent jobbers will suggest how very great is the variety of devices offered the motorist, by exhibits containing specialties of both foreign and domestic manufacture.

Many new magnetos will make their first public appearance among the ignition exhibitors, together with new forms of switches, coils, spark plugs, timers and distributers. The crackle of electric sparks will be heard on the elevated platform, in the balcony, in the second tier boxes, in the third tier boxes, in the concert hall, and in the basement. By means of a coil, timer and set of spark plugs eight times as big as the regular size, the Heinze Electric Co., of Lowell, Mass., will give even the hasty passerby a very clear impression of the action of the Heinze ignition apparatus. A stop at the stand will yield opportunity to see the new Heinze magnetos, in both high and low tension models. These have a low, circular form which in external appearance marks them as different from all others, and are suitable for mounting in many places where the usual high-built types cannot be squeezed in.

In the display of the Splitdorf Laboratory, New York City, will be seen a white marble testing board which is designed to bring out some of the finer points of motor car ignition. As a wire arm revolves, sparks jump from its outer end to small brass plates set at four intervals around the circular path which the arm itself describes. The rapidity of the arm's revolutions is controlled by means of a rheostat governing the motor which actuates it. A Splitdorf coil is mounted on the board and the switch which is incorporated in it may be turned either for battery or magneto ignition, so that the visitor can witness the effects of each in turn. To show how magneto generated sparks thrive under high compression, as against sparks deriving their initial activity from a battery, a small compression chamber is mounted on the board. This is arranged in connection with an air pump so that the pressure can be raised to correspond to that in a motor cylinder on the compression stroke, and the action of the spark on the two different systems can be observed through a small glass window in the compression chamber case. The Splitdorf magnetos themselves will be on view and the features of the Splitdorf system will be explained.

For the benefit of those who like to see the "insides" of things, the Remy Electric Co., of Anderson, Ind., will have one of the new Remy magnetos on the counter with the parts unassembled as a whole. This will show clearly how it is possible to construct a magneto in which the winding is stationary while the revolving armature has no other duty than to move the lines of force which cut the winding. The Remy device gives alternations of direction in the current which it supplies, thus meeting the difficulty in the pitting of coil vibrator points that is sometimes encountered in the use of current impulses all flowing in the same direction. The function of the magneto, under the Remy system, is to supply primary current to a single unit coil on the dash. The high tension current from the coil is sent to the various plugs in turn by means of a distributer embodied in the magneto itself.

Part of the exhibit of the Bosch Magneto Co., of New York, will be from the Paris show. Both high and low tension magnetos will be mounted on suitable stands so that their operation may be seen, including low tension "snap-off" models giving a good spark no matter how slowly the engine turns. The Bosch high tension magneto spark plugs will be on view and the magnetically operated make and break devices which the company produces. Another imported magneto will be revealed in the U. & H., marketed by the J. S. Bretz Co., of New York. This comes in numerous styles, some of which are equipped with a mechanism which gives a sharp "snap-off" at slow speed, but are driven in the regular way at high speed.

The Volta magneto, of the Witherbee Igniter Co., New York, is to be one of the leaders in the company's extensive exhibit of ignition devices, and will possess features that warrant attention. The balance of the exhibit will be made up of accumulators, handy lamps, timers, distributers, spark plugs and switches. Two new magnetos are to be disclosed by the Pittsfield Spark Coil Co., Dalton, Mass., and F. H. Wheeler, Indianapolis, Ind., respectively. The Pittsfield product is distinguished by a rather unique construction which makes it possible to remove the stationary winding with ease, while the type offered in the Wheeler presents a great deal for the sensationally low price asked. Numerous other makers will show either entirely new or improved models in both high and low tension magnetos, giving emphasis to the growing popularity of this means of ignition.

A steering wheel switch by which either the magneto or the battery circuit or both may be put into operation will appear as one of several novelties developed for the coming season by the Connecticut Telephone & Electric Co., Inc., of Meriden, Conn. To show the economical action of "Connecticut" coils and timers, a testing device with large indicator readings for the current consumption will be to the forefront. Kick switches, voltmeters, ammeters, and quick detachable primary and secondary terminals will complete the line.

Tire competition, as it will be indicated at the Garden show, continues to take the healthy form of a striving on the part of each manufacturer to produce the best possible quality. In addition to a showing of the numerous styles of Diamond tires, the Diamond Rubber Co., of Akron, O., will stage its demountable rim, which has been developed and improved from a racing car device to suitability for tourist service. The simplicity and security offered in the rim will be a matter of demonstration to those who are interested in the subject. The Diamond "grip" tires will form a feature of the exhibit.

Specimens from the large line of Hartford tires will be in evidence at the space of the Hartford Rubber Works Co., Hartford, Conn. The latest members of the Hartford family are the new, large size tires to fit ordinary 30x3½ and 32x3½ rims. The new "Standard Universal" quick detachable rim, suitable for either clincher or Dunlop tires, will also have a place. Morgan & Wright, of Detroit, Mich., will likewise feature this rim. Several new styles of Morgan & Wright tires have been perfected since show time a year ago, among which are the flat tread tires, which have increased width and thickness in the tread to give greater traction and improved puncture protection without any sacrifice of resiliency.

At the space of the G & J Tire Co., of Indianapolis, Ind., the display will be of a character calculated to impress upon show visitors the high quality and the variety of styles which are to be found in connection with G & J tires. The reason for the perfect fitting of G & J inner tubes will be expounded, and the record of service which the company's tires enjoy will be dwelt upon.

Without subordinating its tire showing or the importance of its quick acting rim, the Goodyear Tire & Rubber Co., of Akron, O., will put forward the Goodyear air bottle for public consideration. The air bottle, which supplies compressed air for in-

Digitized by Google

flating tires without the use of a pump, is supplied in sizes ranging from little ones that can be stored under a runabout seat to large tanks that can be used in gaarges. One of the novel uses to which the bottles are put during show time is the supplying of compressed air for the big Gabriel horn "pipe organ," which may be expected to provide some of the music of the week.

As an "eye-catcher" at the exhibit of the Firestone Tire & Rubber Co., Akron, O., the trail of the tread on the company's new non-skid tire is to be hung up, preserved in wax on a plank. The all-rubber tread on this type is formed by the raised oblique lettering "Firestone Non-Skid," and the wax impression is convincing evidence of the nature of the road contact which results. The Firestone demountable rim, which may be used with either clincher or quick detachable tires, will be displayed. It consists of three parts, including the channel rim, a locking ring and the demountable portion containing the tire. The construction avoids narrow wedge shapes and sharp angles, so that the parts cannot rust together and make the rim difficult to operate. The full line of Firestone automobile and motor truck tires is to be on view.

Continental tires will, of course, be prominently represented and the well known Continental demountable rim will be ready either for demonstration to those not already familiar with its construction or for trials of speed by owners and chauffeurs who account themselves expert in quick changing. The Continental Caoutchouc Co., of New York, for the coming season offers not only round tread and "AC" flat tread styles, but the flat tread type course and the Continental non-skid, steel studded tires.

The showing of Michelin tires will be complete, and will include a wide choice in sizes, weight and treads. The Michelin Tire Co., Milltown, N. J., will also put forward the Michelin demountable rim, which in its operation is controlled by one turnbuckle. At the space of the Empire Automobile Tire Co., Trenton, N. J., the visitor may look for the red rubber Empire tubes and patches which that company is making popular, and a new, leather covered, steel studded tire, in which the studs of the tread are set within a cut, hardened steel washer. The Dow Tire Co., of New York, will be on hand with Dow tubes, concerning which the demonstrators will readily prove that punctures cannot bring deflation.

Closely associated with tires in its practical use, the Weed chain non-skid and traction device is to be disclosed not only in its standard form, but in some of its newer applications, as for motor buggy wheels. The Weed Chain Tire Grip Co., New York, promises no changes in the general character of the grips, but has greatly increased the mileage of service by adopting materials having a great resistance to wear. The Sager demountable rim, manufactured by the J. H. Sager Co., of Rochester, N. Y., will afford an example of a rim developed outside the tire makers' ranks. Speedy changes are possible with it, and every consideration of safety and tire fit has been taken into account. The rim is to have as companion exhibits the Sager spiral spring equalizer and the Sager protection bumper.

Speed indicators, while having a numerous representation, will have their best examples in such exhibits as that of the Jones Speedometer, the Warner Instrument Co., and the Stewart & Clark Mfg. Co. About 20 styles of Jones instruments will be shown, not including a taximeter which the company is producing and which is one of the first to be made on this side of the Atlantic. The prices of the speed indicators are this year in a range from $15 up to $100, while the concern will offer clocks and odometers as well. Changes have been made in the external appearance of the Warner Auto-Meter, but the principle of magnetic actuation for the speed indicating part of the mechanism is unchanged. Improvements will be disclosed in the odometer part of the instruments, however. A few magnetic by-plays may enliven the exhibit. The Stewart instruments will be arrayed in a series of models, from $15 up, and like those of the other makers will be found in combination with clocks and electric lights in some instances. A "multipolar induction type" speed indicator has been added to the Stewart line as a leader.

For lessening road shocks, the Truffault-Hartford shock absorber, made by the Hartford Suspension Co., of New York, will be offered in an exhibit which should prove one of the liveliest in the place. At the space of the Gabriel Horn Mfg. Co., of Cleveland, O., a Teddy bear will endure shocks or be saved from them, according to whether the Gabriel absorbing device is freed or attached. The company's main attraction will be the Gabriel horns and whistles, together with cut-out valves.

Exhibitors in the class seeking to interest the manufacturer of cars and to supply him with parts will include a big list. The Briscoe Mfg. Co., of Detroit, Mich., will have radiators; the Chandler Company, of Springfield, Mass, is to display samples of its etched metal name-plate work; chains will be represented by the Brampton products controlled by Charles E. Miller, of New York, and by the Baldwin, Diamond and Whitney brands. The Diamond Chain & Mfg. Co., of Indianapolis, Ind., in addition to its Diamond chains; will also have axles, while the Baldwin Chain & Mfg. Co., of Worcester, Mass., has planned to stage as a supplement to its Baldwin chains, a new steering gear.

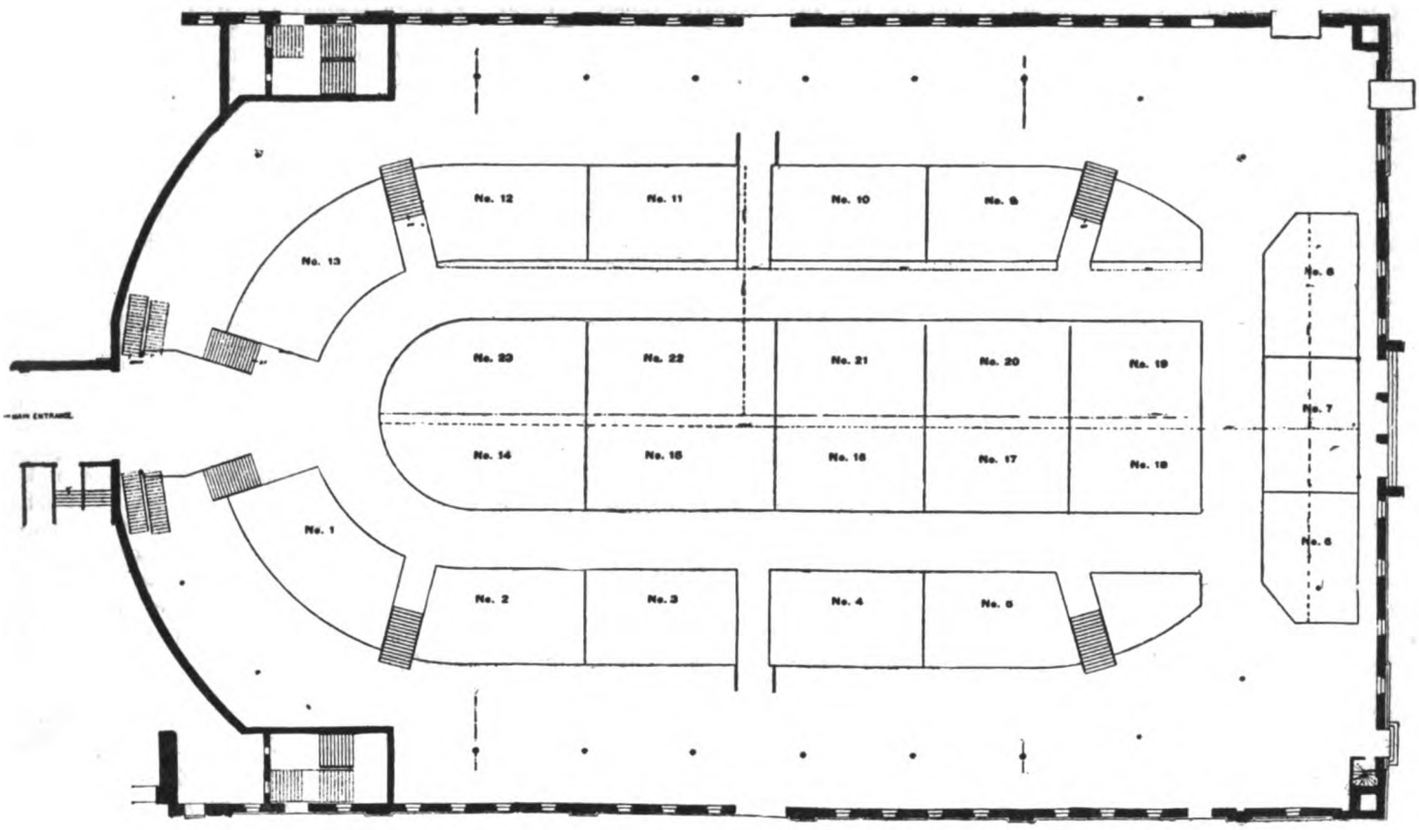
The Springfield Metal Body Co.'s space has been taken for the purpose of a display suggesting the company's capability in body making, while the J. S. Bretz Company, New York, is to put on view F. & S. bearings, Hartford universal joints, and minor specialties such as Bowden wire, as well as the magnetos already mentioned. The Manufacturers Foundry Co., has arranged to show examples of its iron casting work, and the Wm. Cramp & Sons Ship & Engine Building Co., of Philadelphia, depends upon cast specimens of parts made in Parsons' manganese bronze, to attract attention from designers and engineers. Complete front and rear axles are to be staged by the American Ball Bearing Co., of Cleveland, O.; by the Timken Roller Bearing Axle Co., of Canton, O., and by the Standard Roller Bearing Co., of Philadelphia.

For the average visitor, however, exhibits of this order may not have the same attractions as are to be found at such a display as that of the Badger Brass Mfg. Co., of Kenosha and New York. The luster of shining brass, nickel and "patent leather" on its Solar lamps will not be less at the Garden than elsewhere. Attractive things will bunch thickly in the jobbers' spaces, such as the Motor Car Equipment Co., the New York Sporting Goods Co., and Charles E. Miller, where almost every class of motor car novelty or accessory is represented.

The list of exhibitors at the Garden show is as follows:

AUTOMOBILE EXHIBITS.

GASOLENE CARS.



Main Floor.

Autocar Co., Ardmore, Pa., 7—Autocar.
Cadillac Motor Car Co., Detroit, Mich., 4—Cadillac.
Chalmers-Detroit Motor Co., Detroit, Mich., 17—Chalmers-Detroit.
Corbin Motor Vehicle Corporation, New Britain, Conn., 9—Corbin.
Electric Vehicle Co., Hartford, Conn., 12—Columbia.
Elmore Mfg. Co., Clyde, O., 3—Elmore two-cycle.
Everitt-Metzger-Flanders Co., Detroit, Mich., 8—E-M-F.
Franklin Mfg. Co., H. H., Syracuse, N. Y., 18—Franklin.
Knox Automobile Co., Springfield, Mass., 1—Knox.
Locomobile Company of America, Bridgeport, Conn., 19—Locomobile.
Lozier Motor Co., New York, 11—Lozier.
Matheson Motor Car Co., Wilkes-Barre, Pa., 2—Matheson.
Packard Motor Car Co., Detroit, Mich., 14—Packard.
Peerless Motor Car Co., Cleveland, O., 23—Peerless.
Pierce Co., Geo. N., Buffalo, N. Y., 15—Pierce.
Pope Mfg. Co., Hartford, Conn., 20—Pope-Hartford.
Pope Motor Car Co., Toledo, O., 5—Pope-Toledo.
Royal Motor Car Co., Cleveland, O., 6—Royal Tourist.
Stearns Co., F. B., Cleveland, O., 13—Stearns.
Stevens-Duryea Co., Chicopee Falls, Mass., 22—Stevens-Duryea.
Studebaker Automobile Co., South Bend, Ind., 10—Studebaker.
Winton Motor Carriage Co., Cleveland, O., 21—Winton.

Elevated Platform.

Apperson Bros. Automobile Co., Kokomo, Ind., 32—Apperson.
Haynes Automobile Co., Kokomo, Ind., 25—Haynes.
Hewitt Motor Co., New York, 27—Hewitt.

GARDEN SHOW—PLAN OF MAIN FLOOR

Selden Motor Vehicle Co., Rochester, N. Y., 24—Selden.

Simplex Automobile Co., New York, 26—Simplex.

Walter Automobile Co., Trenton, N. J., 28—Walter.

White Company, The, Cleveland, O., 30—White steam cars.

Woods Motor Vehicle Co., Chicago, Ill., 29—Woods.

Electric Cars—Exhibition Hall, Madison Avenue Front.

Anderson Carriage Co., Detroit, Mich., 54—Detroit.

Babcock Electric Carriage Co., Buffalo, N. Y., 55—Babcock.

Bailey & Co., Inc., S. H., Amesbury, Mass., 53—Bailey.

Baker Motor Vehicle Co., Cleveland, O., 57—Baker.

Electric Vehicle Co., Hartford, Conn., 51—Columbia.

Rausch & Lang Carriage Co., Chicago, Ill., 52—R. L.

Studebaker Auto Co., South Bend, Ind., 56—Studebaker.

Waverley Co., The, Indianapolis, Ind., 50—Waverley.

Basement—Commercial Vehicle Depa.

Alden Sampson, 2d, Pittsfield, Mass., 84—Gasolene-Electric road train.

Champion Wagon Co., Owego, N. Y., 77—Champion electric.

Franklin Mfg. Co., H. H., Syracuse, N. Y., 78—Franklin gasolene truck.

General Vehicle Co., Long Island City, N. Y.—General electric trucks.

Hewitt Motor Car Co., New York City, 85—Hewitt gasolene trucks.

Knox Automobile Co., Springfield, Mass., 75—Knox gasolene cars.

Thomas Motor Car Co., Buffalo, N. Y.—Thomas taxicabs.

Studebaker Automobile Co., South Bend, Ind., 81—Studebaker electric trucks.

ACCESSORIES.

Basement.

American Thermo-Ware Co., New York City, 514—Goggles, hydrometers.

Auto Supply Mfg. Co., Brooklyn, N. Y. 516—Horns, tubing and brass specialties.

Burrowes Co., E. T., Portland, Me., 508—Spare wheels and wind shields.

Champion Co., Albert, Boston, Mass., 507—Ignition specialties.

Downing, C. J., New York City, 502—Supplies.

Healy Leather Tire Co., New York City, 501—Tires.

Hill Dryer Co., 513.

King Optical Co., Julius, New York City, 510—Goggles.

Kitsee Storage Battery Co., Scranton, Pa., 503—Storage batteries.

Lavalette & Co., New York City, 517—Magnetos and ignition specialties.

Livingston Radiator Co., New York City, 511—Radiators.

Merchant & Evans Co., Philadelphia, Pa., 524—Multiple disc clutches and automobile fittings.

Motz Clincher Tire & Rubber Co., New York City, 525—Tires.

New Departure Mfg. Co., Bristol, Conn., 521—Annular ball bearings.

Patterson, Gottfried & Hunter, New York City, 500—Tool Outfits and specialties.

Perfection Spring Co., Cleveland, O., 518—Springs.

Post & Lester Co., The, Hartford, Conn., 526—Supplies and specialties.

Stanley & Patterson, New York City, 522—Batteries and tools.

Stromberg Motor Devices Co., Chicago, Ill., 509—Carburetters.

Van Guard Mfg. Co., Joliet, Ill., 523—Windshields.

Vehicle Apron & Hood Co., Columbus, O., 513—Aprons, hoods, collapsible buckets.

White & Bagley Co., The, Worcester, Mass., 512—Lubricants, soap.

Comptoir D'Innovations Pour Auto, New York City, 557—Specialties.

Faultless Auto Tube Co., New York City, 566—Multiple inner tubes.

G. L. Economizer Co., New York City, 556-A—Fuel economizers.

Garvin Machine Co., New York City, 565—Pumps.

Nathan Novelty Mfg. Co., New York City, 559—Tire covers and cases.

Noonan Tool & Machine Works, Roome, N. Y., 560—Tools.

Philadelphia Storage Battery Co., Philadelphia, Pa., 563—Storage batteries.

Pratt & Whitney Co., Hartford, Conn., 561—Machinery.

Troy Carriage & Sun Shade Co., Troy, O., 564—Tops.

Elevated Platform.

Ajax-Grieb Rubber Co., New York City, 134—Ajax tires.

American Ball Bearing Co., Cleveland, O., 164—Ball bearings.

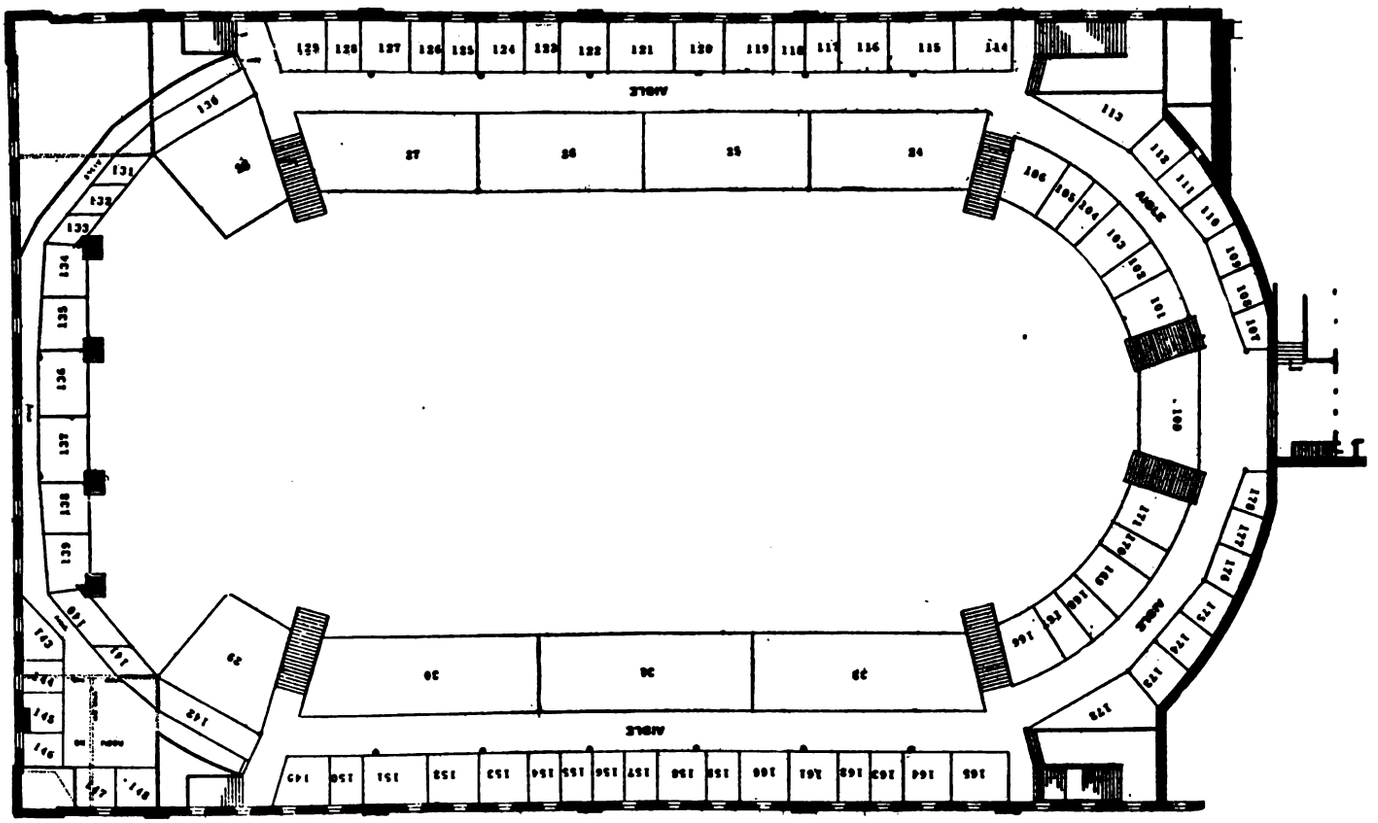
American Electrical Novelty & Mfg. Co., 110—Ever Ready Batteries, lamps and tire specialties.

Atwater-Kent Mfg. Works, Philadelphia, Pa., 117—Igniters and timers.

Atwood-Castle Co., Amesbury, Mass., 156—Lamps.

Autocoil Co., Jersey City, N. J., 123—Coils and ignition systems.

Auto Improvement Co., New York City, 109—Self starting devices and motor specialties.



Avery Portable Lighting Co., Milwaukee, Wis., 145—Gas tanks.

Badger Brass Mfg. Co., New York City and Kenosha, Wis., 165—Solar lamps and acetylene generators.

Baldwin Chain and Mfg. Co., Worcester, Mass., 118—Baldwin chains and recoil check.

Brennan Mfg. Co., Syracuse, N. Y., 160—Motors, pumps.

GARDEN SHOW—PLAN OF ELEVATED PLATFORM

Bowser & Co., S. F., Ft. Wayne, Ind., 113—Tanks, measuring pumps and gasolene storage systems.

Briscoe Mfg. Co., Detroit, Mich., 107—Radiators and fittings.

Brown-Lipe Gear Co., Syracuse, N. Y., 105—Transmission, differential and steering gears.

Byrne, Kingston & Co., Kokomo, Ind., 157—Kingston carburetters.

Connecticut Telephone and Electric Co., Meriden, Conn., 128—Spark coils, switches and ignition specialties.

Consolidated Rubber Tire Co., New York City, 136—Tires.

Continental Caoutchouc Co., New York City, 130—Continental tires.

Cooks Sons, Adam, New York City, 144—Lubricants.

Cramp & Sons Ship & Engine Co., Wm., Philadelphia, Pa., 158—Bronze castings and automobile parts.

Diamond Chain and Mfg. Co., Indianapolis, Ind., 167—Axles, chains, transmissions, sprockets.

Diamond Rubber Co., Akron, O., 101—Diamond tires.

R. E. Dietz Co., New York City, 116—Lamps.

Dixon Crucible Co., Joseph, Jersey City, N. J., 174—Graphite and lubricants.

Dow Tire Co., New York City, 126—Dow tires.

Duff Mfg. Co., Pittsburg, Pa., 140—Jacks.

Chandler Co., Inc., The, Springfield, Mass., 141—Name plates, hub caps and monograms.

Empire Automobile Tire Co., Trenton, N. J., 122—Empire tires.

Firestone Tire & Rubber Co., Akron, O., 149—Firestone tires.

Fisk Rubber Co., Chicopee Falls, Mass., 166—Fisk tires.

G & J Tire Co., Indianapolis, Ind., 106—G & J tires.

Gabriel Horn Mfg. Co., Cleveland, O., 173—Gabriel exhaust horns.

Gilbert Mfg. Co., New Haven, Conn., 108—Tires, jackets, lamps, covers, and rubber cloth specialties.

Goodrich Co., B. F., Akron, O., 100—Goodrich tires.

Goodyear Tire & Rubber Co., Akron, O., 163—Goodyear tires.

Gray & Davis, Amesbury, Mass., 114—Lamps.

Ham Mfg. Co., C. T., Rochester, N. Y., 176—Lamps.

Hardy Co., R. E., The, 133—Spark plugs.

Harris Oil Co., A. W., Providence, R. I., 159—Lubricants.

Hartford Rubber Works, Co., Hartford, Conn., 171—Hartford tires.

Hartford Suspension Co., Jersey City, N. J., 152—Truffault-Hartford shock absorbers.

Heinze Electric Co., Lowell, Mass., 175—Coils and ignition equipment.

Herz & Co., New York City, 112—Timers, plugs and ignition specialties.

Globe Machine & Stamping Co., Cleveland, O., 147—Metal stamping specialties.

Hyatt Roller Bearing Co., Harrison, N. J., 178—Roller bearings.

Jones Speedometer, New York City, 127—Speedometers, annunciators, odometers and specialties.

Janney-Steinmetz & Co., Philadelphia, Pa., 148—Spark plugs, tanks, wrenches.

Jones & Co., Phineas, Newark, N. J., 162—Rims, wood wheels.

Leather Tire Goods Co., Newton Upper Falls, Mass., 143—Non-skid covers.

Light Mfg. & Foundry Co., Pottstown, Pa., 121—Aluminum parts and castings.

Manufacturers Foundry Co., Waterbury, Conn., 154—Castings.

Michelin Tire Co., Milltown, N. J., 142—Michelin tires.

Morgan & Wright, Detroit, Mich., 129—Morgan & Wright tires.

Mosler & Co., A. R., New York City, 172—Spark plugs.

Motsinger Device Mfg. Co., Pendleton, Ind., 155—Ignition systems.

N. Y. & N. J. Lubricant Co., New York City, 119—Lubricants.

Oliver Mfg. Co., Chicago, Ill., 150—Jacks and accessories.

Pennsylvania Rubber Co., Jeannette, Pa., 153—Pennsylvania tires.

Pittsfield Spark Coil Co., Dalton, Mass., 168—Ignition systems.

Remy Electric Co., Anderson, Ind., 125—Magnetos.

Republic Rubber Co., Youngstown, O., 139—Tires.

Sager Co., J. H., Rochester, N. Y., 132—Supplementary springs.

Shelby Steel Tube Co., Pittsburg, Pa., 104—Cold drawn steel tubing.

Spicer Universal Joint Mfg. Co., Plainfield, N. J., 131—Universal joints.

Splitdorf, C. F., New York City, 102—Timers, distributers, coils and ignition specialties.

Standard Welding Co., Cleveland, O., 163—Tubing and electrically welded parts.

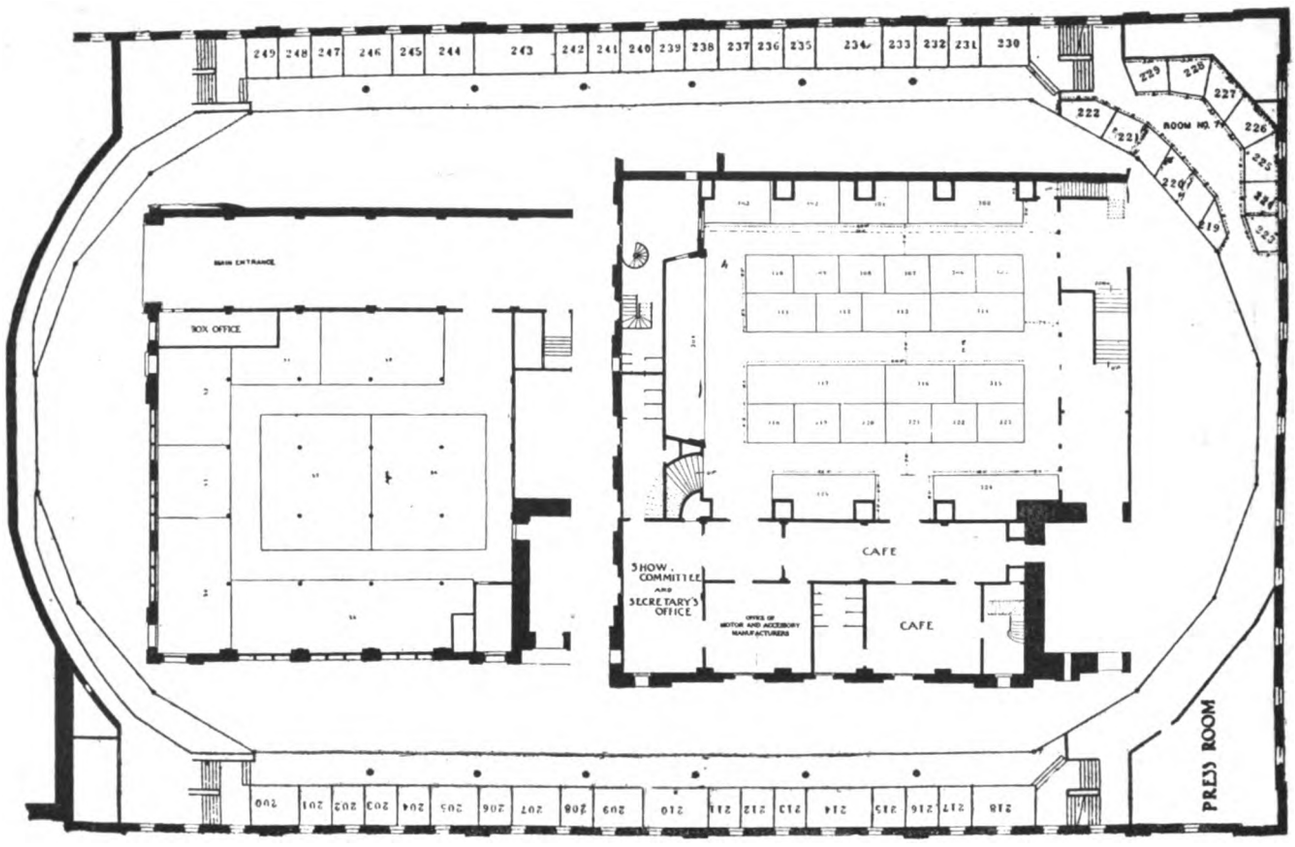
Swinehart Clincher Tire & Rubber Co., Akron, O., 124—Swinehart tires.

Timken Roller Bearing Axle Co., Canton, O., 151—Roller bearings and axles.

Veeder Mfg. Co., Hartford, Conn., 115—Tachometers and tachodometers.

Vacuum Oil Co., Rochester, N. Y., 111—Lubricants.

Valentine & Co., New York City, 177—Varnishes.



Warner Gear Co., Muncie, Ind., 161—Gears and parts.

Warner Instrument Co., Beloit, Wis., 120—Speed indicators and odometers.

Weed Chain Tire Grip Co., New York City, 135—Non-skid tire chains.

Wheeler, F. H., Indianapolis, Ind., 137—Schebler carburetters.

GARDEN SHOW—BALCONY, EXHIBITION AND CONCERT HALLS

Whitney Mfg. Co., Hartford, Conn., 170—Whitney chains and keying systems.

Witherbee Igniter Co., New York City, 138—Witherbee storage batteries and Wico ignition specialties.

Balcony.

A-Z Co., The, New York City, 230—Hoods, radiators and tanks.

Allen Auto Specialty Co., New York City, 207—Tire jackets and specialties.

American Thermos Bottle Co., New York City, 228—Thermos bottles.

Anderson Forge Machine Co., Detroit, Mich., 240—Crankshafts, gears.

Apple Electric Co., Dayton, O., 217—Ignition systems.

Atlas Rubber Co., 239—

Austro-American Separator Co., Cleveland, O., 224—Gasolene funnels.

Auto Pump Co., Springville, N. Y., 219—Pumps.

Benford, E. M., Mt. Vernon, N. Y., 222—Spark plugs.

Bretz Co., J. S., New York City, 214—Ball bearings and high tension magnetos.

Buda Foundry & Mfg. Co., Chicago, Ill., 242—Jacks.

Burnett Compound Spring, Incorporated, Newark, N. J., 241—Suspension springs.

Champion Ignition Co., Flint, Mich., 240—Ignition systems.

Cooks Standard Tool Co., Kalamazoo, Mich., 203—Standard jacks.

Cormack & Co., M. H., 247—

Eastern Carbon Works, Jersey City, N. J., 206—Dry batteries.

English & Mersick Co., New Haven, Conn., 221—Automobile hardware.

Franklin Co., H. H., Syracuse, N. Y., 232

Geiszler Bros., New York City, 248—Batteries.

Havoline Oil Co., New York City, 216—Lubricants.

Haws, Geo. A., New York City, 201—"Panhard oil."

High Frequency Ignition Coil Co., Los Angeles, Cal., 231—Ignition systems.

Hopewell Bros., Cambridge, Mass., 213—Tire cases, covers, robes.

Hydraulic Oil Storage & Distributing Co., Detroit, Mich., 212—Tanks, "Snells" storage systems.

Jarman & Baker, New York City, 237—Drip pans, racks.

Jeffrey-Dewitt Co., Newark, N. J., 208—Spark plugs.

Johnson & Co., Isaac G., Spuyten Duvil, N. Y., 218—Forgings and castings.

K. W. Ignition Co., Cleveland, O., 223—Magnetos, spark plugs.

Keystone Lubricating Co., Philadelphia, Pa., 233—Lubricants.

McCord Mfg. Co., Chicago, Ill., 200—Radiators.

Mann Co., Leon, New York City, 234—Raincoats.

Metal Stamping Co., New York City, 211—Radiators.

Miller, Charles E., New York City, 243—Brampton chains, supplies and accessories.

Miller & Sons, Wm. P., Long Island City, N. Y., 249—Lubricants.

Morrison-Ricker Mfg. Co., Grinnell Ia., 209—Gloves and gauntlets.

Mutty Co., L. J., Boston, Mass., 229—Rubber cloth and imitation leathers.

New York Coil Co., New York City, 226—Spark coils.

N. Y. Sporting Goods Co., New York City, 210—Accessories.

Philadelphia Timer & Machine Co., Philadelphia, Pa., 236—Timers.

Pierson Motor Supply Co., Brooklyn, N. Y., 215—Supplies.

R. I. V., Inc., New York City, 373—Annular ball bearings.

Reilly & Son, Philadelphia, Pa., 235—Lap robes.

Robinson & Sons Co., Wm. C., Brooklyn, N. Y., 203—Lubricants.

Rushmore Dynamo Works, Plainfield, N. J., 220—Acetylene lamps and generators.

Shaler Co., C. A., Waupum, Wis., 202—Electric vulcanizers.

Smith Co., A. O., Milwaukee, Wis., 205—Gears and parts.

Trenton Rubber Mfg. Co., Trenton, N. J., 244—Inner tubes, "Thermoid" brake lining.

Voorhees Rubber Mfg. Co., Jersey City, N. J., 227—Rubber hose and packing.

Winn, Wm. R., 225—

Young, O. W., Newark, N. J., 245—Tire cement, lubricants, soaps.

Second Tier Boxes.

Allers Co., H. A., 405—

Bosch Magneto Co., Robt., New York City, 400-403—Ignition systems.

Columbia Nut and Bolt Co., Bridgeport, Conn., 404—Lock nuts.

Duffy Grease Co., New York City, 417—Lubricants.

Chicago Windshield Co., Chicago, Ill., 420—Windshields.

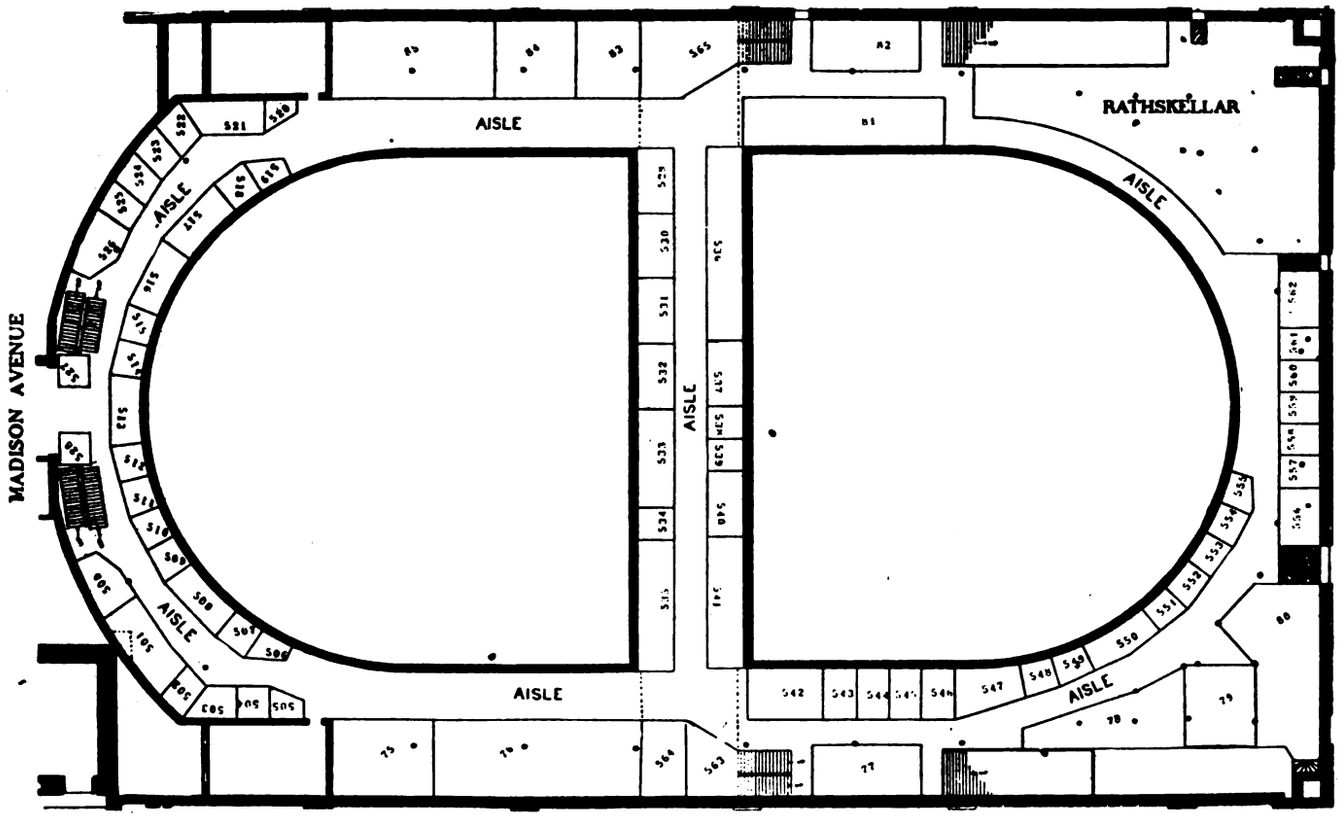
Caloris Mfg. Co., 418—Caloris bottles.

Davis-Bournonville Co., 411-412.

Erie Foundry Co., 414.

Flentje, Ernest, Cambridge, Mass., 415—Shock preventers.

Perfection Wrench Co., Port Chester, N. Y., 413—Wrenches and tools.



Reeves & Son, Paul, Philadelphia, Pa., 407—Bearings, castings.

Samson Leather Tire Co., New York City, 409-410—Tires.

Seamless Rubber Co., New Haven, Conn., 408—Rubber goods.

Sireno Co., New York City, 416—Electric horns.

Traver Blow-Out Patch Co., New York City, 406—Tire repair outfit.

Union Battery Co., Belleville, N. J., 419—Batteries.

Third Tier Boxes.

American Electric Fuse Co., 431—Igniter and magnet wire.

Auto Tire Inflating Co., Brooklyn, N. Y., 430—Tire pumps.

Brictson, A. O., 440.

Elite Mfg. Co., Ashland, O., 429—Jacks and pumps.

H. & C. Bottle Mfg. Co., 439—Vacuum bottles.

Lucas & Co., John, New York City, 438—Paints.

"Lux" Auto Lamp Mfg. Co., 442—Lamps.

Marko Storage Battery Co., Brooklyn, N. Y., 444—Batteries.

Mica Core Mfg. Co., 427—Insulation.

Nadall Mfg. Co., Chicago, Ill., 428—Demountable rims.

Quincy-Manchester-Sargent Co., Plainfield, N. J., 443—Auto Wrenches and steel castings.

Standard Leather Washer Mfg. Co., Newark, N. J., 441—Leather washers.

Vesta Accumulator Co., Chicago, Ill., 425—Accumulators.

Concert Hall.

American & British Mfg. Co., Bridgeport, Conn., 324—Frames, motors, axles and parts.

Chase & Co., L. C., Boston, Mass., 301—Top and cover leathers.

Coes Wrench Co., Worcester, Mass., 320—Wrenches.

Columbia Lubricants Co. of New York, 303—Lubricants.

Cowles & Co., C., New Haven, Conn., 319—Lamps, monograms and boquet holders.

Edmunds & Jones Mfg. Co., Detroit, Mich., 313—Lamps and specialties.

Electric Storage Battery Co., Philadelphia, Pa., 315—Accumulators.

Gemmer Mfg. Co., Detroit, Mich., 318—Steering gear and parts.

Hess-Bright Mfg. Co., Philadelphia, Pa., 304—Bearings.

Hoffecker Co., The, Boston, Mass., 308—Speed indicators.

Lunkenheimer Co., The, Cincinnati, O., 306—Lubricators, grease cups, pet-cocks.

Manhattan Screw & Stamping Works, New York City, 316—Generators, horns, lamps.

Mezger, C. A., Inc., New York City, 323—"Soot-proof" spark plugs.

National Battery Co., New York City, 307—Dry batteries.

National Carbon Co., New York City, 305—Batteries.

Never Miss Spark Plug Co., Lansing, Mich., 321—Plugs, ammeters, battery connections, chain tools.

Noera Mfg. Co., Waterbury, Conn., 302—Specialties.

Pantasote Co., The, New York City, 314—Top and upholstery leather.

Rands Mfg. Co., Detroit, Mich., 325—Tops and accessories.

Randall-Faichney Co., The, Boston, Mass., 312—Oil guns.

Sprague Umbrella Co., Norwalk, O., 300—Tops and windshields.

Springfield Metal Body Co., Springfield, Mass., 317—Bodies and tops.

Standard Roller Bearing Co., Philadelphia, Pa., 311—Ball bearings and parts.

Stewart & Clark Mfg. Co., Philadelphia, Pa., 322—Speed indicators.

Westchester Appliance Co., Yonkers, N. Y., 309—Batteries and coils.

MOTORCYCLES.

Basement.

American Motor Co., Brockton, Mass., 535—M-M.

Aurora Automatic Machinery Co., Aurora, Ill., 542—Thor.

Auto-Bi Co., The Buffalo, N. Y., 545—Auto-Bi.

Baker & Co., F. A., New York City, 537—Motorcycles and supplies.

Bicycling World Co., New York City, 539—Bicycling World & Motorcycle Review.

Consolidated Mfg. Co., Toledo, O., 531—Yale-California.

Crouch Motor Co., Stoneham, Mass., 554—Crouch.

Curtiss Mfg. Co., G. H., Hammondsport, N. Y., 550—Curtiss.

Eclipse Machine Co., Elmira, N. Y., 551—Eclipse coaster brakes.

Excelsior Supply Co., Chicago, Ill., 532—Excelsior.

Harley-Davidson Motor Co., Milwaukee, Wis., 544—Harley-Davidson.

Hendee Mfg. Co., Springfield, Mass., 536—Indian.

Hornecker Motor Mfg. Co., Genesee, Ill. 543—Torpedo.

Merkel-Light Motor Co., Milwaukee, Wis., 529—Merkel-Light.

Mesinger Mfg. Co., H. & F., New York City, 549—Saddles.

Motor Car Equipment Co., New York City, 547—Spark plugs.

National Sales Corporation, New York City, 540—Peugeot motors.

Reliance Motorcycle Co., Owego, N. Y., 553—Reliance.

N. S. U. Motor Co., New York City, 533—N. S. U.

New Era Gas Engine Co., Dayton, O., 552—New Era.

Ovington Motor Co., New York City, 540—F. N.

Pierce Cycle Co., Buffalo, N. Y., 538—Pierce.

Reading Standard Mfg. Co., Reading, Pa., 541—Reading Standard.

Royal Motor Co., Worcester, Mass., 555—Royal.

Walton Motor Co., Inc., Lynbrook, L. I., 548—Midget Bi-Car.

CHICAGO PROMISES A GREAT SHOW

Many New Models to be Unveiled and New Accessories Displayed—Gorgeous Effects in Decorative Scheme.

With the opening of the Chicago Show only a little over three weeks off, plans for its staging are being rushed to conclusion with customary vigor. Although the total number of motor vehicle exhibitors thus far enrolled is 92, according to the official figures, no less than 15 makers of pleasure cars have been turned away for lack of more space, and nearly as many makers of utility machines. Indeed, owing to the demand for additional space, the management made an unsuccessful attempt to secure space in nearby buildings. Tattersall's, where the commercial vehicle section was located last year, was among the possibilities considered, but was rejected because of its inaccessibility and poor condition. An attempt also was made to secure the furniture building on the corner below the Colliseum, but without success. As a result, such concerns as the Electric Vehicle Co., Palmer & Singer, the International Harvester Co., and the Royal Tourist Co., which made late application for space, have been crowded out. The show will be no larger and no smaller than the last, because the limits of the building have already been reached, but the number of exhibitors will be somewhat increased by reason of a rearrangement of the center floor of the Coliseum.

Despite the unfortunate feature mentioned, Chicago's exhibition will maintain its former prestige in unveiling a number of cars not presented at the earlier eastern shows, as well as a host of accessories which will be on view for the first time. Of the hitherto-unshown cars there will be no less than 24 this year, embracing the exhibits of the American Locomotive Co., Bartholomew Co., Buick Motor Co., T. B. Jeffery & Co., Olds Motor Works, Ricketts Auto Works, Auburn Auto Co., Berliet Import Co., Columbus Buggy Co., Dorris Motor Car Co., Fort Pitt Motor Mfg. Co., Kiblinger Co., Kimball & Co., Meteor Motor Car Co., Model Automobile Co., Staver Carriage Co., Streator Motor Car Co., Bendix Co., Clark-Hatleld Auto Co., Emancipator Auto Co., Mier Carriage & Buggy Co., Randolph Motor Car Co., Rider-Lewis Motor Car Co., Owen Thomas Motor Co.

The decorative scheme chosen it is confidently expected will eclipse anything hitherto attempted in this connection. Somewhat the same plan as that of last year will be utilized, but with certain additional features calculated to change its character and greatly heighten the effect. It is stated that this probably will be the last show—at any rate for a time—decorated in this style, for plans for 1910 of an entirely different character are already under way. Indeed, some of its features will, for experimental purposes, be introduced this season.

The use of papier mache and staff which was so largely employed last year will again be brought into prominence, but with an alteration in appearance caused by its coloring, which will be bronze or old gold, according to the fancy of the visitor. The building will be divided into four groups of equal size with aisles in the form of a cross. Down the center of each group, dividing it into two long rows, will be massive pillars bearing aloft, at heights ranging from 9 to 15 feet, representations of bronze statuary, all bearing the imprint of automobiling—sport, utility and commerce combined. The two ends will present racing scenes.

The principal feature will be at the center of each group. At a height of 15 feet will be a massive wheel, six feet in diameter, and below it the figure of a man of heroic size, depicted in the act of giving it impetus. Stretching to the right and left will be an arch curved outwardly at its ends, mounting two pictures of automobile scenes, and two circular and two oblong stained glass windows, the remainder backed with green silk and golden trimmings.

STAINED GLASS DECORATIONS FOR CHICAGO SHOW

Along the top of the section, above a red silk background, on which will be white and gold raised letters, runs a white flower-box, filled to a height of two feet with real ferns and flowers. The same general effect will be carried out in all parts of the building. None of the walls or roof will be visible—all will be paneled. From the ground up to a height of 10 feet will be wooden panels of mission style, and thence, to the front of the gallery, will be panels of lighter design—probably in light green and white. The entire roof will be similarly treated.

To electric lighting more than the usual attention will be given. No less than 64 flaming arcs are to be used, in addition to the regular lighting equipment and smaller decorative effects, such as 250 12-inch globes and a great number of smaller incandescent lights.

HOW TIRES CAUSE ROAD DAMAGE

It is by Abrasion and not by Suction Engineer Lewis Asserts—His Views on Durable Highway Construction.

That the destruction of the highways which is so freely attributed to the tremendous vogue of the automobile is caused not by the "suction" of the tires, but rather by the severe abrading influence of the tires caused by their tractive effort, is the opinion of chief engineer Nelson F. Lewis of the Board of Estimate and Apportionment of New York City. The popular theory that the lifting action of the tire treads serves to draw the binding material and dust away from the bed of the road is, in engineer Lewis' opinion, disproved by the fact that while the front wheels of a moving car raise little or no dust a great amount is rolled up by the hind wheels, upon which the entire tractive or driving force of the vehicle is concentrated. The opinion was brought out in connection with his report to Mayor McClellan in which he also discusses various methods of treating highway surfaces to preserve them from surface abrasion and promote the much-desired dustless quality.

In his report he contrasts the pavement systems of New York with those of Paris and London and discusses four methods of treating roads. Of the latter, the chief engineer is in favor of the mixing method, in which stone, which is to form the wearing surface, is thoroughly coated with hot bituminous cement. This is spread on the road while hot and rolled as is the case with ordinary first layers of asphalt. Rhode Island and other places have had many miles of road constructed in this way and while it is the most expensive method, Lewis declares it is more likely than any other to produce a road which is structurally and inherently dustless.

Nice Legal Point on Tail Lights.

Tail lights on automobiles are not necessary in Des Moines, Iowa, if the red lights on the sides can be seen from the rear. This is the result of a decision rendered by Judge McHenry of the district court. A number of automobilists who were arrested for driving around the city streets at night without tail lights, and whom Police Judge A. K. Stewart fined, appealed to the higher tribunal. Judge Stewart appeared to sustain his own action and contended that to comply with the law the automobiles must have lights hung on the rear. But Judge McHenry, after a close scrutiny of the State law, found that the only requirement was that a red light shall show to the rear of the car. There was nothing to demand that the light must hang at the rear end of the car, so he dismissed all the cases.

How Makers Persuade Prospective Purchasers

However much a possible customer may be impressed with the appearance, mechanical ingenuity or other visible quality of a car, he invariably inquires into the features wherein it differs from other cars, whether in or out of its own particular class. The question of price is in many respects the governing factor in the sale of cars, regardless of the actual amounts asked for them by their makers. The intending buyer always wants to know how much he is getting for his money—it matters not whether it be expressed in hundreds or thousands, and the salesman is constantly beset with the difficulty of expounding to the non-technical caller the precise advantages of the car which he represents. He must be an instructor in applied mechanics as well as a vendor of manufactured wares, in order to make his mark in his calling.

Because as the number of cars in the market multiplies and their features gradually are assimilated into the unity which is proudly known as standardization, the public also is absorbing a vast and at times embarrassing amount of mechanical knowledge, the work of the motor car salesman is surrounded with tremendous perplexities. If the car he wishes to sell happens to be one of thoroughly standard characteristics, he is quite likely to encounter a bright "prospect" who has discovered in the course of his travels another car of similar build in many respects which also possesses standard features. To convince him of the superiority of his own product, the salesman must have recourse to a deal of art at times. But always he must know wherein and in exactly what details it differs from other cars.

Since salesmen are not engineers, even as few engineers possess the qualifications requisite to successful salesmanship, he must rely in large measure upon the selling department of the producing company in equipping himself for his campaign. As instrumental in shaping the course of their representatives, therefore, and hence, as more or less responsible for their relative degrees of success, it is the attitude of the manufacturers themselves which, in the last analysis determines the selling methods employed in marketing the various products.

In order to sell cars, it is no longer necessary that a machine shall possess a number of features which are not found on any other. Such is the power of the slogan "standardization" over the average mind, that it frequently happens that a car possessing striking differences from others is looked upon in the slanting light of an experiment. Yet this is not always the case. Generalities are impossible in the selling of any wares, and the really successful sales manager finds it expedient to leave a great deal to the discretion of the individual representative. At the same time, certain selling platforms are maintained by all the manufacturers, and a comparison of these proves both interesting and instructive.

Recently the Motor World published a symposium of statements bearing upon this problem which came from a number of manufacturers whose products were displayed at the automobile show in Grand Central Palace. Following is a similar array of principles enunciated by members of the Association of Licensed Automobile Manufacturers. The communications from which these statements are drawn were in reply to the uniform inquiry: "Wherein and in exactly what details does your car differ from others? In endeavoring to make sales, upon what points do you lay the most stress?"

H. H. Franklin Mfg. Co.—"Air-cooling of the engine constitutes the most significant and important difference between the Franklin motor car and most other automobiles. In the process of air-cooling an essential factor, and one distinctive of the Franklin, is shown in the heat radiating flanges of thin sheet metal which surround the cylinders. Three other features of the engine are special developments of the Franklin. They are the auxiliary exhaust, the dome head of the cylinder and the concentric intake and exhaust valves. Each contributes toward making air-cooling a success and the motor efficient. The auxiliary exhaust, at the bottom of the cylinder, takes off 71 per cent. of the burned gases immediately upon the completion of the power stroke, leaving only a small percentage to pass off through the main exhaust. This main exhaust valve is in the cylinder head and is concentric with the intake valve. The concentric arrangement makes possible the use of large valves in a minimum of space so that the charge may be large and a maximum of power be obtained. This arrangement of valves makes possible the dome shape of the cylinder head, which reduces the interior surface without decreasing the exterior, or heat radiating surface. The dome head has no nooks in which dead gas can lurk. This insures full clearing of the cylinder and a full charge of fresh gas."

The Haynes Automobile Co.—"The motor is of heavy solid construction throughout; it is equipped with roller bearings; the oil pump and oil reservoir are located in the crank arms, and therefore take up no room; we use a constricting band clutch, which we have had in successful operation for nearly 14 years; our rear axle is driven by means of a roller pinion and bevel sprocket instead of the usual bevel gears; our brakes are all external, and are duplicates in construction throughout; the brake drums each hold about one quart of water, which can be added when required for long hills. In making sales we call special attention to the above features, and particularly to the oiling system and roller bearings in the motor. We also lay much stress upon the roller pinion drive, since it is free from breakage, wears indefinitely and makes no noise. We lay special stress upon the brakes, since the safety of the driver depends upon this feature. The water cooling arrangements permit of descending long and steep hills, not only without danger of burning out the brakes, but without overheating since the temperature of the brake drums can never rise above the boiling point of water so long as there is any water in the drum."

Apperson Bros.' Automobile Co.—"In making sales we lay stress on several points: Apperson Bros. were practical mechanics before automobiles were on the market. The Apperson Bros. designed and built the first car placed upon the market commercially in America. For over 15 years Apperson Bros. have been building constantly high grade automobiles, and they have had more experience in this line of business than any other manufacturer. Experience ought to and does count, and as a result of experience in automobile construction, as a result of years of experience in the selection of and treatment of steels and other component parts of automobiles, Apperson Bros. today are turning out for use under American road conditions, the best cars built in the world."

Stevens Duryea Co.—"We claim that the three point suspension and unit power plant, originated by Stevens Duryea Co. and copied by a large number of American manufacturers and some foreign manufacturers, is one of the best forms of automobile construction. We were the originators of this idea and in proof that it is the right form of automobile construction, we have the attempted imitations by scores of manufacturers. The Stevens Duryea Co., which is part of the J. Stevens Arms & Tool Co., gun makers of 58 years standing, expert workers in high grade steel, did not have to learn how to handle materials which enter automobile construction, as the majority of manufacturers did, as this was the natural line of their work. The testing out of automobiles before they are delivered to the agent or buyer by us, we believe, is the most thorough and complete of any automobile manufacturer in this country, if not in the world."

The Corbin Motor Vehicle Corporation.—

Digitized by Google

"Ours is the only medium priced car which is mounted entirely on imported ball bearings. It is the most accessible car in the world and everything simplified as much as possible. It is the lightest car in its class tending toward economy in tires and ease of handling. By tests it has proved to be the most efficient 30 horsepower car and has repeatedly defeated all makes in fuel consumption for weight carried. We have built practically the same car for the last four years, making changes only in the size of the motor and in a great many cases retaining the same parts which were used in our first cars. The transmission, steering gear, and rear axle have been unchanged for three years and we find it is not necessary to make new types of cars from year to year. It is built of nothing but the best materials that can be purchased and is up to the standard of the Corbin Hardware, which is known throughout the country as the best."

The Elmore Manufacturing Co.—"The Elmore car differs radically from any other, from the fact of its using a two cycle engine, which has only three movable parts. This same simplicity is carried out throughout the car, and is the point that we dwell on most. The second point is the reliability of the engine. A third point is the small cost of maintenance of the car by the user. Other points are the simplicity and reliability of the ignition of the cars, their past record and the opinions of the owners."

Electric Vehicle Co.—"We consider the 'Mark 48—3' as a medium-powered car, built strictly for American long distance road service. This is the fourth year of the Mark 48—3 and practically the only changes that we have found it necessary or desirable to make are in matters of detail. Our past experience shows conclusively that it is probably the most economical car to be had at the present time when we take into account cost of upkeep and cost of operation on the road. We rely upon the past record of the car and lay particular stress upon the high quality of material used, upon the fact that the car is built entire in our own plant and not assembled from parts built by outside concerns and upon the fact that for 1909 any type of body now regularly demanded may be fitted on the one standard size of frame and length of wheel base."

Winton Motor Carriage Co.—"Our selling points are, in general, the superiority of six-cylinder cars over other types, and, in particular, the self-starting feature of our construction and the low cost of upkeep as shown by our sworn records of 65,687.4 miles on a total upkeep expense of $15.12."

Cadillac Motor Car Co.—"There is practically no part of the car which we do not manufacture ourselves from our own designs. Of course, the maker who buys his parts largely from outside parts makers is liable to get the same motor, the same transmission, the same steering wheel, the same axle, the same radiator as some other automobile manufacturer might be using, but in our case it is different, as practically every part of a Cadillac car has its own individuality."

Everitt-Metzger-Flanders Co.—"One of our strongest points on the E-M-F '30' is, 'Nothing new—no frills or furbelows. Nothing omitted that experience has proven or convention taught you to consider a necessary part of a first class motor car.' It has been our aim to perfect and simplify the standard automobile construction and, not to invent, but to incorporate in the E-M-F '30' only such details of design as have been thoroughly tried and proven. The only point at which it differs from the general run of four-cylinder cars is in the incorporation of the selective sliding gear transmission in the rear axle. Production in quantities, heretofore unheard of in a car of this size and power; the use of special steels for each special service; the use of steel drop forged throughout, to the entire elimination of malleable castings, and thorough equipment of the car for touring conditions are the principal claims we make."

Chalmers-Detroit Motor Co.—"The Chalmers-Detroit '30' has the following distinctive mechanical features: 4 cylinders cast en bloc, two-bearing crank shafts, unusually long wheel base for this type of car, body swung between the axles to give easiest riding qualities, constant level splash lubricating system operated by gear pump. In making a sale we lay particular stress not alone on the mechanical features in which it is distinctive from all other cars, but on the general excellence of the whole car at the price."

Hewitt Motor Co.—"Our trucks are stronger than others of the same rated capacity; they have larger wearing surfaces, and are better designed with reference to the proportion of power to weight. We have given especial attention to the maintenance of our cars, and the tires give long wear. Our control is superior to any in the market, being three interlocked pedals and a throttle pedal, without any spark advance whatever. We use the highest grade of ignition and oiling system, and produce a car which will run the maximum distance for the money."

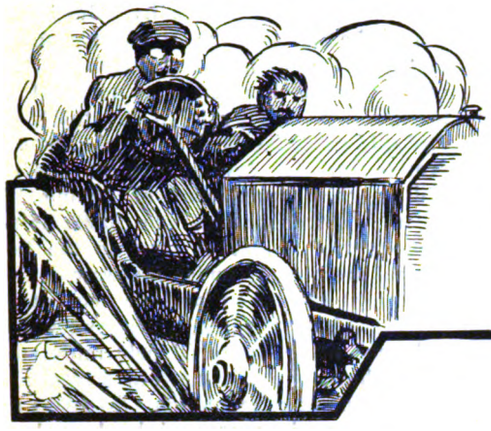
A brief summary of the points dwelt upon by other manufacturers in endeavoring to make sales follows:

Packard Motor Car Co.—The Packard "Thirty" is the development of a type which was adopted in 1904; it has been improved each season, but it never has been radically changed. Distinctive features emphasized are: the use of Eisemann magneto with storage battery using a single distributor for either source of current; splash lubrication by two positive, adjustable pumps feeding to the front and rear compartments of the crank case; hydraulic governor incorporated in the water circulating system; original carburetter design; transmission by a long propeller shaft with encased universal joints, in combination with a sliding change speed gear combined with the differential gears in a rear axle unit; original design of expanding ring clutch; light weight, safety of control system, and good suspension.

E. R. Thomas Motor Co.—"The highest powered touring cars in the world"; smooth operation due to use of six-cylinder motor; reserve of power and speed; complete equipment in high-powered car; reliability; two separate and distinct systems of ignition; extra long springs; large brakes; three-disc clutch; four forward speeds; easy steering. For smaller six-cylinder car, in addition to the above: 36-inch wheels, double-elliptic springs; hand-hammered aluminum body; drop frame; herringbone gears; all the characteristics of a much more expensive machine. For town car: high gear ratio permitting running over "any passable hill or road"; short wheel base; low centre of gravity; wide doors and low step; non-skidding tendencies and short turning radius.

The Royal Tourist Car Co.—"Durability, accessibility, simplicity, flexibility and interchangeability, reliability"; largest and most comfortable body on any American car; complete fender protection; special convenience of control elements; three-point suspension for motor, transmission and radiator; ball-bearing cam shafts; practically a triple oiling system; new type carburetter; all parts machined to fractional thousandths of an inch and unless passed by inspection department are not used; interchangeability.

Status of Machines Repaired Abroad.



The status of repairs made on machines while abroad, when such machines subsequently are brought back to this country, will be the subject of argument before the United States Circuit Court at the present session, in connection with an appeal by the government. The appeal is for review of a decision of the Circuit Court, in which it was decided that an automobile is a household effect, and that where an automobile has been repaired abroad, it is dutiable only to the value of the repairs.

W. R. Grace & Co., of this city, appear as the litigants in the test case which may eventually reach the Supreme Court. The attorneys for the importers will maintain that the imposition of the full 45 per cent. duty on renovated machines is unjust and has no warrant in law.

Auto-Moving Picture Exhibition.

What is to be, in more than one sense, a moving picture show, is a combined motor vehicle and picture machine for which a patent has been granted to James H. Gravell, of Philadelphia, Pa., and George D. Farwell, of Bridgeport, Conn. The specifications of the vehicle include the necessary machinery for the exhibition of moving pictures; an electric generator for operating the show; and a motor which can be employed either in propelling the vehicle or in driving the electric generator.

RACING DRIVERS

Racing on this side of the water never has been the established part of the machinery for popularizing and selling cars that it has abroad. There was a time when the pioneer American manufacturers found it highly profitable, because every race or tour in which they participated with any success brought them sheaves of orders as a result of the free newspaper publicity given to their exploits. Strangely enough, some of the early makers for whom racing did the most were among the first to give it up when the number of competitors in the same field began to grow bothersome.

In fact there are comparatively few American manufacturers who have stuck to racing from year to year with anything like the persistency and effort that has characterized the policy of a large list of foreign makers. As a consequence the business of race-driving as a special vocation and means of livelihood has not been open to drivers in America as it has been to those of Europe, where not only fame, but fortune has been the portion of men capable of driving speed cars to victory in the big contests.

Upon the usually sudden and spasmodic impulse to enter a car or cars in a racing contest, the American manufacturer is in more or less difficulty about getting drivers who may be absolutely relied upon not to overlook a possible point in making winners of their machines. Not but what the drivers in his own testing department have all the desirable qualities of loyalty, intelligence, quickness, nerve and mechanical skill, but they lack actual racing experience, which more and more is coming to be recognized as a large element in racing success.

In attempting a representation of the proportion which the driver's share bears to that of the car itself in landing a race victory, various estimates on a percentage basis have been given by experts, ranging in some cases 90 per cent. for the car and 10 per cent. for the driver to situations where it has been 40 per cent. for the car and 60 per cent. for the driver. Racing history gives numerous instances where the man with the apparently inferior car has won, simply by reason of superior brain work and judgment.

Short, straight-away time trials present the minimum demand of racing judgment on the part of the driver. They require considerable high speed experience, however, not only for directing the car in a path which is true, but to detect the slightest departure from maximum motor speeds, and to keep the adjustment of gas, air and spark at the most efficient combination. Circular track racing, which for the good of the cause is now under the ban, when conducted between cars of nearly equal speed yields victory most readily to the driver who abandons caution and has the heart for "rough work," such as "cutting-in" and "switching" on the turns.

The more or less cruel and highly dangerous affairs, known as twenty-four hours races, differ materially from the short sprint events in the qualities required. Proved physical endurance is demanded of a driver in such a contest. Not so much is it speed, but dogged regularity in making the rounds that counts. An easy way of taking the turns to save tires is desirable, together with the ability to pick the best path as the character of the track changes during the grinding hours of wear. Some nice calculation in deciding when to go in for fuel and gasolene or for tire replacements is also required. All these matters and the determination of a rate of speed which will keep the car well up with the leaders and yet not rack it to the breaking point, give opportunity for the exercise of a very high degree of judgment.

Big road races are the greatest test for a driver's judgment and ability. Here the elements of high speed, long distance and the almost certain necessity for tire changes and fuel replenishments, together with the large possibility of repair stops, all combine to put on the driver a responsibility for wise conduct that will measure him completely.

"Long distance road race drivers must be neither too old nor yet too young. They must be at once conservative and daring. In short, they need a heart of fire and a brain of ice." This is an expert's summing up of the general temperamental qualities required, in addition to whatever mechanical skill and steering cleverness they may have.

Widely different in characteristics as a Nazzaro, a Hemery, a Wagner, a Thery, a Lancia and a Lautenschlager may appear, they all have certain qualities in common. The German, Lautenschlager, represents preparation and method, while Lancia, during his racing career, was a type of brilliant individualist. Hemery stands as the bulldog type of persistence, while Nazzaro has ridden to victory in the graceful attitude of an effeminate but fearless expert. Similar contrasts exist throughout the list of famous drivers, but practically every man in the list, as the result of long racing experience, has developed that caste of mind which enables him to see the race as a whole and to squeeze out the best results that his car can give under whatever circumstances may arise. No matter what may happen, such a driver has met with a similar situation before and is in a measure prepared for it. In a mechanical sense his car contains no surprises for him, and the heat of the contest cannot disturb the calmness of his contemplation as to what is the best thing to do at the moment.

By natural gravitation the best drivers generally get the best cars, just as the best jockeys get the best horses. Consequently having once attained any degree of racing fame, a driver is apt to enjoy more or less continued success. But a close examination of the racing lists shows that in almost every big event there are new drivers who in respect to their machines are quite on a par with their fellows. Rarely, however, do they make a showing that is comparable with that of the experienced drivers.

Time and again where three or more cars identical in every respect have been entered by a manufacturer, the one piloted by the most experienced and famous of his drivers has quite outdistanced the others.

Successive winning of the elimination trials and the grand Prix race by Thery with a car inferior to many of its rivals in speed, proved how great a part of the victory is due to the driver. Thery's ex-

Digitized by Google

ploits in the Grand Prix events at one time placed him at the head of the list. It was in his driving that the idea of conservatism and self-restraint had its most notable example, the virtues of his policy having influenced race driving ever since. Car after car passed him in some of the big events, but by holding down to considerably less than the limit of his machine's capability he was able to finish in first position through not having to stop for road repairs. In one of the Grand Prix events it looked as though Lancia had beaten him in runaway style, but in the last lap the latter's radiator was punctured by a flying stone and the cautious Thery won—as he had said he would.

Many cars were ahead of Lautenschlager at different times in the last Grand Prix, but no panic of wild driving seized the ultimate winner as he kept the speed he had determined upon to bring him victory. So many successes have attended the policy of keeping to a conservative schedule based on the probabilities of the average speed of the winning car, that for a time almost every camp manager had an obsession to put his driver or drivers absolutely under instructions in this regard, subject to alteration during the race in case of unexpected developments. But the plan is not a perfect success where the drivers are wiser heads than the camp manager.

Almost every race camp now provides a signal system for its drivers, either to give information or to flash instructions. Some of these have been very elaborate, with a code designed not only to tell the driver his position in the race, but which cars were ahead of him and by how much, with perhaps a command either to go faster or to take things easier. At Savannah it was said of Hemery that dependence on his camp's signal system lost him the race because, complete as it was, it failed to tell him at the beginning of the last round that while there was only one car ahead of him in point of position there was another rival only 2 seconds back of him in point of elapsed time. Having overtaken Nazzaro because of the latter's tire trouble, he was himself overtaken by 54 seconds on the time basis because he finished more leisurely than he would have done had he known that another driver was pressing him so hard.

At the winning camp in the same race the signal system was purposely very simple, giving nothing more than the driver's position in the race with the addition of where the camp's leading car stood and the lap number. The drivers were depended upon to drive wisely without camp instructions or advice other than the general policy agreed upon before the race.

Where two or more drivers are piloting the one make of car, it is sometimes arranged to have each follow a slightly different plan, although the variation may hardly be perceptible to the onlooker. Where there are three drivers for the one make, the policy generally followed of late has been to have one driver open up and go the limit as long as his car will hold together; the second to drive on a fast schedule, but with some caution on the bad stretches; and the third to follow a slower schedule which is likely to bring him through without road stops.

De Palma was selected to make as much of a runaway as he could at Savannah, while his two confreres, Nazzaro and Wagner, drove more cautiously, the former to a schedule which would have placed him the winner but for two consecutive cases of tire trouble in the very last lap. De Palma spoiled his car after two furious laps and was set far back because of the tire and other troubles that ensued, and it remained for Wagner to take up the burden of landing the victory, which he did.

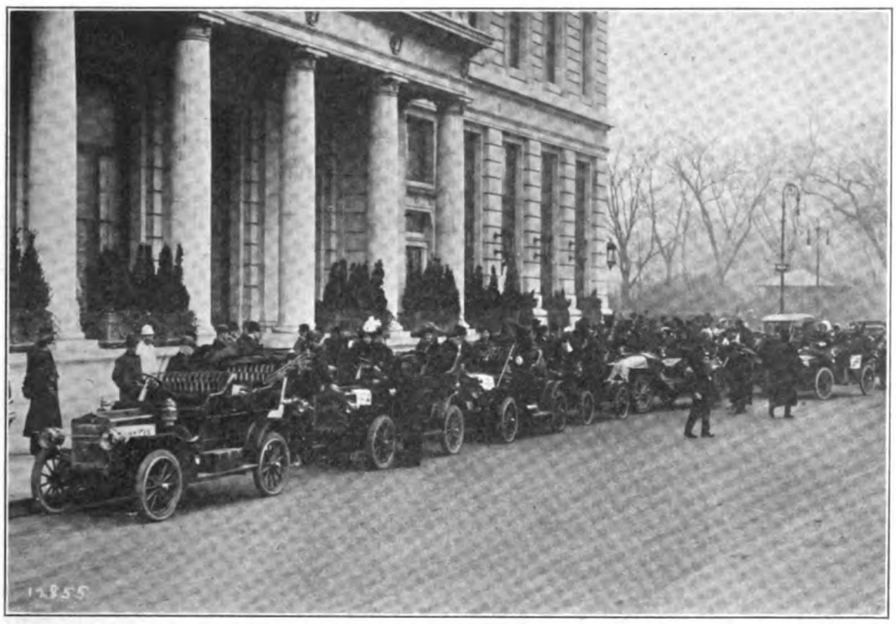
Hemery, Hanriot and Erle, the trio constituting an opposing team, worked in much the same way, Hanriot being the reckless, top-speed driver for the occasion, Hemery on a schedule to match Nazzaro's and Erle as the cautious one who "saved" his car. Adventitious accident put Erle out of it, but the results of the two most notable examples of intelligent team work appeared on the final score when the two teams in question divided the first four places, one having first and third and the other second and fourth.

It would be unjust to say that there are no good American race drivers, but they are very few. The opportunities for racing practice are so limited as compared with the practice which foreign drivers get, as to largely explain the difference. Except for short periods immediately preceding some of the big races, drivers on this side are not permitted to indulge in high speed work. In preparation for a big race the foreign driver has his car delivered into his hands months before the event and has little difficulty in finding roads where he can try it out to the limit.

The mere speed race driving presents no particular difficulties to the domestic talent. The strain of driving at 100 miles per hour is little greater than at 70 miles, except for the increased wind pressure which at the higher speeds is a powerful force, thrusting the driver back in his seat as if to flatten him out completely. There are hundreds of American drivers who can steer around curves and through narrow openings with as much precision at high speed as any of the foreign drivers. Nevertheless, from the fact that this steering ability is born of practice with touring cars rather than racing machines, and does not take into account the racing need of saving tire strain and other seemingly trivial and merely theoretical considerations, expert observers claim to discern in the driving of most Americans a lack of the delicacy of touch and judgment which characterizes the work of the most skilled foreign drivers.

No one questions but that with the same financial rewards and the same opportunities, American race drivers would equal those of any other nationality. But by reason of the fact that the American manufacturers at no time regard racing in the light of the serious business that some of the foreign makers take it to be, there will probably never be on this side the same incentive for the development of superior skill in this special class of driving. Of those American drivers who have already gained some degree of fame in the field, several are already under the watchful eye of foreign makers as possible acquisitions, because of their youth, spirit and ability.

At one time Barney Oldfield represented the highest type of American driver, from the standpoint of reputation. So far as personal daring is concerned he has always ranked 100 per cent., but inasmuch as most of his exploits have been on circular tracks, which are still the scene of his barnstorming enterprise, he can hardly be accounted a great road driver. His road racing performance, while creditable, exhibited no marked signs of superior skill. Joe Tracy has a deservedly large following, long experience and a certain calmness of temperament giving him the qualities which make for driving success, the chances for which, however, he has latterly relinquished in favor of less exciting duties. George Robertson, who won the Vanderbilt event in an American car, has all the dash and daring that could be desired and should he continue as a race driver would develop into one of the best. The good luck which attended Lewis Strang in the three big events which he captured during last year was matched by his driving skill, which in no small degree accounted for it. In the Savannah race he encountered real road trouble, however, but met it well, and made an excellent showing. Ralph DePalma has whirlwind qualities as a driver, but the greater part of his experience has been in track work. He has been pronounced a "comer" by competent critics, who believe that he will show up in the front ranks in the future.



In the style of driving that is necessary in the "tours" and endurance contests which have proved so valuable in the progress of the American industry, no equals can be found for the American drivers in resourcefulness and courage. The nature of a good part of America's roads give all the needed experience, and situations which to the foreign driver would be not only unusual but apparently hopeless strike American drivers as diverting problems to be not ingeniously and skillfully. George Schuster, in the New York to Paris contest, met and conquered difficulties that far exceeded the much advertised troubles of the Paris-Pekin expedition, ultimately winning against competitors supposedly representing the pick of European endurance drivers. He was but the prototype of a large list of American drivers who, in Glidden tours and Western endurance contests, perform feats of road driving that cannot be excelled.

WOMEN IN A RELIABILITY RUN

Nine of Them in Competitive Drive from New York to Philadelphia and Return —All Complete the Journey.

What that bachelor-expert, John C. Wetmore, described as "the cutest little reliability run" that ever happened, left the Plaza, New York, Monday last, 11th inst. It was the run of the—ahem! Wo-

START OF THE WOMEN'S RELIABILITY RUN

mens' Motoring Club of New York. The club himself was not personally present to witness the start, but his press bureau was there in force and other of his lieutenants were usefully in evidence and performed their duties acceptably. It was no fault of theirs if any woman, suffragette or "anti," who likes that sort of thing did not several times get her name or picture, or both, in the public prints. The contest was a two days' affair, Philadelphia, Pa., being the turning point of the route.

When the "suffragettes" finally checked in at the Plaza on the return trip, around 6 p. m., Tuesday, Manager Alex Schwalbach did not venture to announce the names of the winners. That was too intricate a task. Mrs. Cuneo, to be sure, was the first to reach the finish line with her Lancia mount, but inasmuch as most of the other contestants covered the entire two days' run on schedule time without mishap, under the somewhat vague rules of the affair, the committee will doubtless encounter some difficulty in allotting the prizes so as not to cause hard feeling on the part of several contestants possibly possessed of a full share of sensitiveness.

At the start of the run in the early hours of Monday, nine contesting cars, with female drivers at the wheel, lined up and proceeded towards one of the North River's most popular ferries, crossing to Jersey City. The caravan was composed of five Maxwell cars piloted respectively by Mrs. J R. Ramsey, Mrs. Lillian Gillespie, Miss Bertha Rittwetzer, Mrs. P. Bach and Mrs. E. P. Gresh; a Renault, with Miss Evelyn Buckman at the wheel, Mrs. A. W. Seaman in a Franklin, Miss Alice D. Hayes in a Cadillac, and Mrs. Joan Newton Cuneo herself in the Lancia "Lampo." A confetti car, preceeding the pack, and two press cars following, carried the mere men chaperones —the club's lieutenants, and newspaper correspondents.

The social side of the contest was dominant from the start and the first stop was made at Newark, where the local automobile club entertained the chauffeuses for a few brief moments in the club house, which was especially decorated for the occasion with flowers and flags. From Newark the drivers flashed through Elizabeth, Rahway and Metuchen, and then paused for luncheon at the Ajax-Grieb Rubber Company's factory in Trenton. Horace B. De Lisser, president of the company, was host of the occasion and he had some beautiful thoughts to express to the fair ones.

Through the kindness of the weather god, the remainder of the trip, which had commenced under unfavorable conditions, to the Quaker City was smooth and pleasant, Mrs. Cuneo taking the lead from Mrs. Ramsey, who had held it as far as Trenton, and bringing the "Lampo" into the checking station in front of the Walton, the Philadelphia club's headquarters, an hour ahead of schedule. Following came the remainder of the contenders in a close string, no trouble being reported. The Quaker City Motor Club received the ladies warmly and provided entertainment, Mayor Reyburn being among those to congratulate the drivers.

When the second lap of the suffragette run began the next day and the cars trailed back to the Metropolis, there were more receptions and celebrations. On the second visit to Trenton, a stop was made at the capitol and Governor Fort addressed the party. The roads were in fine condition with the exception of one town, Burlington, N. J., which was a mass of mud holes. A few of the cars floundered around in this swampy boulevard and when one contestant tried to drive on the sidewalk her car became wedged between two trees. Then the first rain of the trip began to pour down and the run became a wet one.

At Grant City, the tourists were the guests of the Richmond County Automobile Club and after this celebration, which

TRENTON'S GREETING TO THE "SUFFRAGETTES"

Digitized by Google

was most acceptable in view of the weather the Women's Motoring Club of New York chugged back to the city in which it sprang up so recently. On this part of the run, some of the drivers criticized the way Mrs. Seaman handled her car. She was so anxious to beat Mrs. Cuneo, that she became quite reckless and had several narrow escapes. Twice she ran her headlights into the pilot car's tonneau. Jake Schreyer, who drove a lonely Maxwell runabout, mixed things with a freight train while crossing railroad tracks out in the wild country and smashed off a fender and a lamp or two, but he survived to continue.

France Abandons the Grand Prix.

That the Automobile Club of France has decided to abandon the famous Grand Prix race which had been scheduled for July next was the brief cabled announcement received in America Friday, 1st inst. That the announcement failed to create any great amount of surprise is not to be wondered at in view of the amusing stand that has been taken by the French makers since the subject of a Grand Prix for 1909 was first broached.

As is already well known the French manufacturers are suffering from an acute attack of that malady slangily referred to as "cold feet." In other words, France, which originated automobile racing, has found that it is too great an expense to bear in the future. In plain English, the French suffered so many defeats with odds all in their favor this season that they have decided they can learn nothing more from racing.

The ludicrousness of the position may be understood when it is explained that some time ago the racing board of the Automobile Club of France, composed entirely of French constructors, got together and formulated rules for the 1909 Grand Prix, which were in accordance with the international rules drafted at a congress of the representatives of the international automobile clubs. These rules materially diminished the size of cars eligible to compete as compared with those employed last year.

After having gravely made the rules the French makers got together and signed an agreement not to enter the racing field in 1909. The rules of the Grand Prix stated that unless 40 racing cars were entered by 6 o'clock on the evening of December 31st, 1908, the event would be declared off. Since the stipulated number of entries was far in excess of any previous requirement and all the large manufacturers had made an agreement not to participate in racing it was not surprising that only nine entries should have been received at the time of closing the lists.

New Orleans Plans "Ladies' Race."

New Orleans is said to have included a "ladies race" in its Mardi Gras racement. If the report is true, New Orleans has reason to be ashamed of itself.

WINNERS IN QUAKER CITY RUN

Official Announcement Displaces Two of the Runnersup—Four Contestants Who Finished are Disqualified.

After no little wrangling, on Wednesday last, 6th inst., the contest committees of the Quaker City Motor Club made its first official announcement of the results of the club's strenuous endurance contest from Philadelphia to Wilkes-Barre and return on January 1-2. A revision of the score as first announced unofficially, changed the order of the winners considerably, positively disqualifying Ray McNamara's Premier entry, together with three others, and moving the two Oldsmobiles up to second and third places. The findings of the committee were anything but favorable to a number of the contestants and their followers, the Premier representatives feeling highly incensed at the decision in their case. McNamara's car had a perfect score technically, but was disqualified because it did not carry its full complement of passengers over a short distance of the course, while endeavoring to secure footing in getting around a car which was blocking the road. J. H. Hall, the entrant, claimed that this discharging of passengers was done with the full knowledge and consent of one of the contest committee and that for this reason the subsequent penalty was unjust.

The other three disqualified contestants were: H. B. Tuttle, Stoddard-Dayton; C. S. Carris, Franklin, and F. W. Darnstadt, Rambler. The six cars which started originally but did not finish were not credited and received no scores.

The official score of the survivors, as given out on Wednesday, was as follows:

Class "A"—Touring Cars.

Driver.	Car.	Points Penalty.
William Miller,	Mattheson	11
F. G. Folberth,	Oldsmobile	13
Tom Berger,	Oldsmobile	15
Laurent Grosso,	Stearns	30
John Dietrich,	Matheson	37
Ross Anderson,	Matheson	70
Ed. Burnshaw,	Cadillac	81
William Freitag.	Mitchell	127
William Crawford,	Cadillac	135
Robert Shirk,	Stod.-Dayton	140
Frank Yerger,	Studebaker	195
A. McCormick,	Acme	269
Herb Bitner,	Maxwell	758

Class "B"—Roadster.

Geo. Brooks,	Peerless	50
W. C. Longstreth,	Maxwell	239

Hartford to Have a Mid-Winter Race.

The Quaker City Motor Club is not alone in promoting a mid-winter endurance run, as a contest of the sort has just been announced from Hartford, Conn. The date will be January 28th, and the route selected is from Hartford to Pittsfield, Mass., and return, a distance of 156 miles. On the out trip the towns passed through will be Avon, Canton, Pine Meadow, Winsted, Norfolk, Canaan, Barrington and Lenox, and the return journey will carry the contestants through Washington Village, Chester, Huntington, Westfield, Springfield, Thompsonville, Warehouse Point and East Hartford. The feature of the run is the beautiful simplicity of the rules. There is just one and that states that a competing car must go from Hartford to Pittsfield and return by the prescribed route. The minimum scheduled time for making the run is eight hours and the car arriving at the finish nearest to this mark shall be adjudged the winner.

Charleston Holds a Road Race.

To mark the opening of the rebuilt road between Charleston and Summerville, S. C., some sixteen local motorists held an "endurance contest and road race" from Magnolia Crossing to Otranto, a distance of 12.7 miles. Contestants were in two divisions, amateur and professional, the latter class being composed of dealers. G. Norwood Haste won first place in the amateur competition, his time being 31½ minutes, and J. H. Rast captured the dealers' prize, covering the distance in 27 minutes flat. A schedule of penalties for adjustments also entered into consideration.

Glidden Tour Scheduled for July.

Although it has not been definitely announced by Chairman Frank B. Hower just where his tour—by courtesy still known as the Glidden tour—will start or finish next summer, he has stated that it will positively start from somewhere during the week of July 5. During automobile show week, Hower was busy at the Grand Central Palace soliciting entries among the manufacturers for his next A. A. A. tour. The number of entries obtained, however, was not made public. The list is to close June 15; the fee being $200 per car, if entered before May 15; and $300 for entries accepted later.

Another Hill Climb at Los Angeles.

Los Angeles, Cal., which is fond of hill-climbing contests, will witness another event of this sort on Washington's birthday, when the Automobile Dealers' Association holds its Pasadena-Altedena competition. The course, which extends from just inside the city limits of Pasadena and takes one up a strenuous incline to the crown of a hill in Altedena, is regarded by motor enthusiasts in that part of the country as an ideal slope.

Late Date for Florida Sandfest.

Dates for the annual speed carnival on the Ormond-Daytona course, Florida, have been set. Later than any meet held heretofore, the sandfest will occupy four days, March 22 to 25. Daytona, which has always been jealous of its neighbor, Ormond, will have entire charge this season, the meet being under the direct auspices of the Florida East Coast Automobile Association.

TO IMPROVE NEW JERSEY'S LAW

Governor Fort Recommends Some Amendments of a Liberal Character—But He Does not Favor Lower Taxation.

Governor Fort, as was expected, made some important recommendations concerning automobile legislation in his annual message, sent in to the New Jersey legislature on Tuesday, 12th inst. But he maintains that it is not unfair to the motorist to make him pay up to $14 per year for the privilege of motoring in that State. Calling attention to what he said in his inaugural address last year as to the creation of a motor vehicle department, he predicts for that department large growth and a revenue production of a "quarter of a million dollars per year within the next five years." He adds: "It demands the constant and undivided attention of a distinct head, with the requisite inspectors and other officers to enforce the law. All such power should be exclusively in the hands of this department. Arrest and bail might be allowed by local constables or police for alleged violation of the law, but further procedure as to settlement or suit should be exclusively in this department, or its representative, that all cases of unjust apprehension, and all acts of unscrupulous justices of the peace, who for the costs they receive encourage this class of litigation, would be ended."

In connection with this topic the Governor refers briefly to the matter of interstate comity, recently brought to his attention by a committee from the Newark Board of Trade. He says: "A more simple and easy method of procuring a license, especially by non-residents, should prevail."

Under the specific heading of "Automobiles" the Governor says: "The automobile is with us, and it has come to stay. It must be given all highway rights, under proper restrictions to protect the public and the occupants of the machine. Railroad regulation as to the running of trains, safety appliances and the like are intended for the protection of the passenger more, if anything, than the traveler crossing the tracks.

"All vehicles upon the public highway should be required to carry lights.

"Speed regulations in the open country should be liberal; 30 miles an hour could be allowed there with safety.

"Arrest and trial should not be summary, but the right to stop should only exist to inquire as to the possession by the driver of the machine of the requisite authority, or to obtain its number, if violation of law be claimed.

"Suit should only be instituted by direction of the department in proper courts near the residence of the alleged offender, or at convenient points within the State for the non-resident.

"Wilful injury to person or property by the driver of a car, or such injury by an intoxicated driver, should be a misdemeanor, and punishable accordingly, without, of course, the loss of right to maintain a civil suit by the injured party or the owner of the damaged property.

"The present license fees are not excessive and should not be modified by any reduction, unless it be through some system of uniform legislation between the States."

Public roads also come in for important mention in the message, and what the Governor has to say upon this topic includes a recommendation that "a commission be created, consisting of the Governor, the President of the Senate, the Speaker of the House, and the State road commissioner," who shall have authority to take over all highways "from county seat to county seat and along the proposed shore boulevard route, that they may be maintained by the State, through the State road department, without expense to the localities through which the roads pass, the control of the surface of these roads being transferred to the commission by the local authorities. All the revenue derived from license fees for automobiles should be given to this commission to be used in the maintenance of these highways, and such additional sum added thereto annually, by appropriation, as will furnish a sufficient fund to properly maintain them."

What Motorists Pay Massachusetts.

While the Massachusettes Highway Commission is up to its eyes in the work of issuing automobile licenses for the new year it has found time to give out the figures for the last fiscal year of the automobile registration department, ending with Nov. 30. Receipts in fees were $121,488.50, or $30,000 more than for the fiscal year ended Nov. 30, 1907. The statement in detail shows the registrations and income therefrom in December, 1907, as follows: 14 automobiles, $70; 5 motorcycles, $10; 2 manufacturers or dealers, $30. In 1908 there were registered 18,052 automobiles, $90,260; 1,917 motorcycles, $3,854; 379 manufacturers or dealers, $85,685. Licenses to operate were issued in 1908 to 5,865 private operators, the fees aggregating $11,730; 2,343 professional chauffeurs, $4,686; and there were 4,962 renewals, returning in fees $2,481; and 1,215 examinations, returning in fees $2,430. For 545 copies of certificates and licenses furnished the fees amounted to $272.50.

New Jersey Favors New York Taxicabs.

A blanket form of license has been issued by the Commissioner of Vehicles of the State of New Jersey to the New York Taxicab Co., to run its machines through that State. Jersey City police have been notified by the Commissioner that drivers of these cabs are not to be stopped because they do not display license numbers, as other automobiles are required to do under the law.

FOR CITY CONTROL OF MOTORING

Mayor McClellan Recommends Supervision of Taximeters—Police Department Wants Larger Powers.

Mayor McClellan, in his annual message to the Board of Aldermen and Police Commissioner Bingham, in, in his annual report, which were published last week, both have something to say on the motoring situation in New York City. Adoption of their several recommendations would lead to practically placing the situation within the absolute control of the municipal authorities, excepting only the matter of those registration and license requirements which are embodied in the State law. Among the Mayor's recommendations is one to the effect that all automobiles should be equipped with adequate mufflers. He appears to have taken a leaf out of the Park Board's book in recommending that, except for the first ten seconds after starting, no smoke should be allowed to come out from the exhaust pipes. Also he favors the prohibition of acetylene headlights within the built up parts of the city. These recommendations also figured in his message one year ago, but were unheeded by the city fathers.

On the taximeter cab question the Mayor expresses himself by saying: "I respectfully suggest to your honorable body the adoption of an ordinance requiring taximeters to be tested by the city. Within a year it has become evident that the taximeter, with its supposedly exact measurement of distance and time, is a popular appendix of public vehicles. It is, however, as subject to error as any other mechanical device, and should be inspected as are weights and measures."

Commissioner Bingham's recommendations aim to confer upon the Police Department much larger powers than now pertain to it in the regulation of motoring within the city. He would have the question of speed governed wholly by considerations for public safety, without any specific limitations. The result of this, of course, would be to make policemen competent witnesses as to time, place and conditions determining the question of reckless driving, regardless of what the actual speed might be. The Commissioner would have the licenses of chauffeurs issued by the Police Department, each license to bear a photograph of the chauffeur to whom it is issued, and to be revocable by the Department.

The board of aldermen was prompt to act on the mayor's recommendation concerning taximeters. Two ordinances were introduced at the meeting of the board on Tuesday, 12th inst. Alderman B. W. B. Brown was sponsor for one of them, which amends Chapter VIII. of the Code of Ordinances so as to place upon the Bureau of Weights and Measures the duty of inspect-

Digitized by Google

ing "taximeters or mileage registers." Alderman Frank L. Dowling introduced the other measure, which requires the chief of the Bureau of Licenses to investigate and test the accuracy and efficiency of any machine device or register to be used in cabs, coupes, or automobiles, to show the fare of passengers, the charges for baggage, and the mileage covered by the vehicle, and directing the making of written reports of such tests to the Board of Aldermen. Both ordinances were referred to the committee on laws and registrations, with a request to give public hearings.

Governor Draper Suggests Heavier Tax.

When Governor Eben S. Draper, of Massachusetts, made his inaugural address upon taking office this week, he did not overlook the fact that the automobile question is one requiring serious attention. He said:

"As I have previously stated, these vehicles have, in my opinion, come to stay, and will constantly increase in numbers. I have already referred to changes that I think it would be wise to make in legislation having to do with increased receipts from the use of certain classes of machines.

"I further believe that our laws should be so amended as better to regulate the conditions under which they are run. The object to be attained by such legislation, in my view, is to prevent reckless operation of such machines on the public highways. Speed limits may have their advantages, but they oftentimes work a hardship on careful operators.

"The laws should be so framed that any reckless operation of a motor vehicle, at any speed, should be the test for fine or other punishment, as the case may be. The object to be attained is to frame laws which will prevent reckless and dangerous operation of such vehicles. Where any particular person is convicted, the penalty should be severe; and if glaring cases of recklessness are found, the guilty operator should be prohibited from further opportunity for such action.

"I would further suggest that some law might be passed which would make it a criminal offence to use an automobile without the owner's permission."

Unusual Wear on Connecticut Roads.

According to State Highway Commissioner McDonald, improved Connecticut State roads are having havoc wrought upon them to a greater extent than ever before. Wear on the highways is now estimated at 79 per cent., whereas it was formerly only 22 per cent. Various processes of oiling have been tried and new forms of road building have been suggested, but the latter are too expensive for general use in the State and upon the whole, the commissioner does not know what to do about it. It is his intention to bring the matter before the forthcoming session of the General Assembly, which may result in a higher rate of taxation being imposed upon motorists.

JUSTIFIES THE NEW JERSEY LAW

Commissioner Smith's Annual Report Defends the State's Automobile Policy—He Suggests Improvements.

In his third annual report, State Commissioner J. B. R. Smith, of New Jersey, resents the charge that his state under the present automobile regulations has been unfair to motorists from other states. The Commissioner feels quite hurt to think that New Jersey should be accused of such a thing, although he admits that the law could be improved. However, he declares that a boycott, or "propaganda" as he calls it, against the trades and pleasure resorts which has been freely discussed by certain automobilists as a means of coercing favorable legislation, will by no means accomplish the desired effect.

He declares that if the larger offenses against the state automobile law are made misdemeanors, the change will have the desired effect of saving motorists much of the annoyance they are now apt to experience. Under present conditions, summary proceedings may be taken by justices of the peace, but if such offenses as they deal with were made misdemeanors, unscrupulous justices would have no incentive to annoy innocent motorists, while out-and-out law breakers would get the punishment they deserve and "pickings" for rural "J. P.'s" would become a thing of the past.

In discussing the question of interstate comity, which is an important matter at present, the Commissioner says:

"There are under consideration four methods of dealing with this subject. First, to refrain from recognizing foreign registration, as is done by New Jersey, Pennsylvania and some other states; second, to recognize indefinitely foreign registrations, as is done by New York; third, to recognize foreign registration for a limited term for five, ten or fifteen days, as is the prevailing practice in New England; fourth, to issue, for a nominal consideration, a short term registration. Because of the practical difficulties in the way of enforcing the limit, the effect of the New England plan is to admit indefinitely on foreign registrations.

"The fourth plan has been suggested to the last two Legislatures in New Jersey, but has failed of adoption, partially, in all probability, because of the opposition of motorists themselves, representatives of automobile organizations insisting that if they cannot receive the courtesy without cost they do not desire to accept it at all. Many non-resident motorists feel and freely charge that our failure to reciprocate what they regard as their courtesy is a selfishness and barbarism unworthy of our own or any other state; while New Jersey motorists, particularly those residing in the northern counties and who have occasion to enjoy the liberality of the New York and New England laws in this respect, share in their belief.

"I believe it can be clearly demonstrated that notwithstanding the expense and trouble incurred by non-resident motorists in procuring New Jersey registrations, we of New Jersey offer to visiting motorists manyfold more inducements than other states, even with their registration courtesies, offered to Jerseymen."

Commissioner Smith disagrees with the many automobile owners, who think that the required registration fee is too heavy. In this connection he says:

"Regarding the revenue feature of our present scheme of registration, there is perhaps much room for legitimate and honest doubt. There is hardly a question, however, but that at the present time the public almost unanimously believes that automobiles are not carrying more than an equitable share of the burden of the repair of the improved roads. When it is considered that the cost of improvement to the hard roads of the state is more than $800,000 per annum, and that the revenues from motorists aggregate less than one-fourth that amount, it would seem that this popular conclusion is well founded.

"In this connection it may be well to state that more than half of the automobiles registered in New Jersey are owned by non-residents. If, then, the state adheres to its present policy of asking the automobilists to contribute approximately one-fourth of the cost of the repair of the roads (there being no charge to the motorists for their original construction), it becomes apparent that if reciprocal courtesies are to be extended to non-residents, the registration fees charged to New Jersey motorists must at least be doubled. If non-residents are not asked to contribute, residents must make greater contributions.

"Much of the present annoyance to tourists comes from the necessity of procuring new identification markers for each separate state. A scheme of interstate identification markers could easily be established. This would preserve all the present valuable features of state registration, and would relieve tourists of much trouble."

In regard to his plan for making particularly flagrant offenses misdemeanors, the Commissioner does not hesitate to deplore the New Jersey system of inflicting fines.

"There is much ground for criticism," he says, "regarding our method of enforcing penalties. I think there should be no hesitancy in saying that not only the spirit of the act, but the spirit of the magistrates, as well has been to place too great importance upon minor offenses, and to allow the more flagrant offenders to go with insufficient punishment. Slight distinction is made between a drunken driver or one driving without the owner's consent, and an innocent person who perchance has failed to carry his certificate with him."

THE CONSTITUENTS OF THE TIRE

Some Fallacies and the Facts—Where and How Rubber is Obtained—Source of the Sea Island Cotton.

Familiar as the average motorist is with the construction and use of the pneumatic tire, it is a curious fact that his knowledge of the materials of which it is composed and of the methods employed in its manufacture is very limited. The entire rubber industry is to the outsider, shrouded in mystery and more or less in misapprehension as well. This begins with the popular and erroneous impresion that crude rubber is derived from the sap of certain tropical plants, and extends through nearly every step in the process of tire production, even to the Sea Island cotton used in weaving the fabric, and which except to a limited extent is produced many miles inland from the locality which gives it its name. Considerable interest, therefore, attaches to the simple narrative of the derivation of these elements of the tire as told by H. S. Firestone, president of the firestone Tire & Rubber Co., which has just been prepared.

"Civilization first heard of rubber in Herrera's account of the second voyage of Columbus in the year 1493, where he speaks of elastic balls made by the natives from the gum of a tree," says Mr. Firestone.

"The first authentic account of its practical use was recorded in 1745 by the leader of a French Governmental expedition returning from South America who reported that the natives secured from the juice of a tree a certain gum which was very elastic, impervious to water and used in making bottles, shoes and squirt guns. Thirty years later it was introduced to commerce when an Englishman brought from Assam, India, a soft spongy substance which would erase lead pencil marks and which afterwards became known as India rubber.

"Many primitive uses were found for this wonderful gum, but owing to its susceptibility to changes of temperature, which rendered it sticky and more or less fluid, rubber did not come into its own until early in the last century. At that time it was discovered after a great deal of experiment, that by mixing sulphur with crude rubber and subjecting it to a high degree of heat, these former deficiencies were eliminated and a material was produced which was both tough and elastic, and would retain those properties under varying temperatures. This process of curing was called vulcanization and is the basis of rubber making today.

"So great has been the development of rubber manufacture since that time that its products now exceed a value of five hundred million dollars annually.

"Contrary to the popular impression rubber gum is not derived from the sap. It is secured from a milky juice or 'latex' which is found only in the bark. This latex contains a substance known as caoutchouc (the active principle of rubber), together with certain albuminoids, resins, etc., which upon the evaporation of moisture coagulate, forming a thick, spongy substance. The percentage of caoutchouc, in proportion to other ingredients contained in the latex, determines the quality of the rubber.

"The regions from which rubber gum is secured form an irregular belt in the tropics and sub-tropics extending around the earth, the quality procured varying greatly according to the species of plant, the soil and the climate. Great quantities are produced in Africa, Mexico, Ceylon and the Malay Islands, but the most desirable rubber for resiliency and wear resistance is secured from a tree found in the Amazon River district, South America. This rubber is known as Para, the name being derived from its chief city of export. It not only contains as high as 95 per cent. of caoutchouc, but the methods used by the natives in preparing it for market are so much superior that it is selected in preference to all others for the manufacture of the best automobile tires.

"Rubber gathering in the Amazon River district is a hazardous and difficult undertaking. The supply comes from wild trees scattered throughout dense forests, to which paths must be cut through the tangled and luxuriant undergrowth. Even then, the trees can only be reached during three to five months of the year, as throughout the wet season the forests are completely inundated. The climate is so unhealthy that white men cannot do this work and it is necessary to rely upon the native blacks, who at best are undependable and lazy. Their reluctance to join rubber gathering expeditions can readily be understood when it is remembered that out of a season's expedition perhaps only half will return alive.

"When a rubber tree is found the native gatherer cuts a series of gashes into the bark with his machete, encircling the tree from the ground up, as high as he can reach. Cups are fastened to catch the latex as it oozes out. When a sufficient quantity is collected it is removed to the temporary hut where a dense smoke producing fire is made of certain nuts and palm leaves. Then taking his wooden paddle the native dips it into the latex and holds it over the fire, turning it round and round until the latex coagulates. As soon as it is hard a new layer of latex is added and coagulated as before. This process is continued until the mass has grown too large for handling, when the paddle is taken out and the rubber set aside for export. In this form it is known as a ham or biscuit of Para. The process of coagulation and fumigation with these specially selected nuts and leaves prevents decay and adds to the life and wear resistance of the manufactured product.

"Tapping the trees for rubber does not necessarily destroy them, nor is it believed to materially shorten their life; but unfortunately many thousands of trees are annually rendered useless by careless and improper methods.

"In order to obviate the difficulties encountered in gathering wild rubber and facilitate production, artificial cultivation has been resorted to in various localities. Scores of millions of dollars have been lost in ventures of this character, many of them merely wild-cat promoted schemes. It is estimated now, however, that there are 300,000 acres of rubber plantations in Ceylon and the Malay region and 100,000 acres elsewhere, principally in Mexico, some of which have already started to yield and promise handsome returns to investors.

"In other localities rubber is collected and coagulated by a variety of methods. Africa, for instance, produces quantities of rubber from various species of vines, roots and even grasses which are destroyed in order to secure latex, but which are rapidly replaced by new growth. These rubbers are designated by many different names, chiefly from their locality or the name of the native tribe gathering them. The methods of coagulation are very crude; some by evaporation, some by plant acids and others by smearing over the bodies of the natives. The proportion of caoutchouc in some of these rubbers runs as low as 60 per cent., but each has its own particular place in the general manufacturing field.

"Next to rubber the most important material in a pneumatic tire is the fabric which gives form and rigidity to the tire. Extensive experiments have been made with all textiles to secure a fabric, which in the finished condition will combine best with rubber, be unaffected by the chemical action in manufacture and demonstrate the greatest strength. Silk and linen show great strength, but when combined with rubber will not produce the results which can be obtained from cotton. There are many grades of cotton, the best of which is long staple Sea Island. It is erroneously supposed that this cotton grows exclusively on islands off the coast of South Carolina, but in fact only the seed comes from these islands, the supply being grown on the mainland. The next best cotton comes from Egypt, which grade for grade is estimated to average about 20 per cent. less strong than Sea Island.

"There has been a great amount of thought, time and money devoted to the combination of rubber and fabric into a sccessful pneumatic tire and developing it to its present stage of perfection. The scope of this expenditure is well illustrated by the fact that 1,641 patents have been issued in the United States since the first one, May 8, 1847, to say nothing of the numerous patents on solid and cushion tires. It is needless to say that many of these patents have come to nought, and that most of the men embarking in the business have failed to succeed. The development of the rubber tire has been the survival of the fittest."

The Week's Patents.

900,635. Ball Bearing. Frederick W. Witte, Leipzig-Plagwitz, Germany. Original application filed April 11, 1908. Serial No. 426,624.

A ball bearing comprising balls, an inner and an outer ring, each having a curved track, and one of said rings having gaps around its edge for the balls, each gap passing spirally from one side inwardly toward the track and being a depth where it enters the track which is less than the full depth of such track, whereby an abutment for the balls is left at the end of each gap.

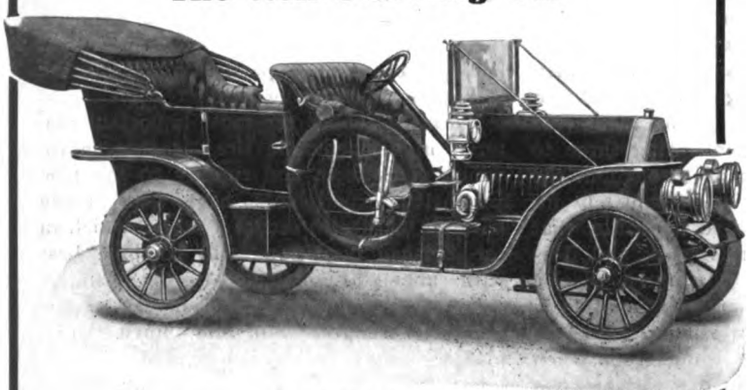
900,638. Gasolene Strainer. Oscar Zschoge, Brooklyn, N. Y. Filed April 15, 1908. Serial oN. 427,274.

1. In a strainer, the combination with the casing having oppositely located inlet and outlet, of a movable block within the casing having a plurality of passages arranged to register with the said inlet and outlet of the casing, strainers placed in the said passages and movable with the block, and means for moving the block from the outside, substantially as described.

900,675. Variable Speed Transmission Mechanism. Albert Latham, Waltham, Mass., assignor of one-half to James W. Nourbourn, Somerville, Mass. Filed Feb. 26, 1906. Serial No. 303,118.

1. In a variable speed transmission mechanism, a transmission shaft and a countershaft, a circular clutch member rotatively free on the transmission shaft, gearing connecting the countershaft and said clutch member, a support mounted on and non-rotative relatively to the transmission shaft and carrying a fellow clutch member for coaction with the said first clutch member, a collar, having a clutch device operating member, a slide movable parallel with the transmission shaft, having a member engaging for endwise movements, only, the said collar, a rock shaft having an arm engaging said slide and having an angular lever, a revoluble cam coacting with said angular lever, and means for turning said cam and correspondingly positioning the said collar.

900731. Carburetter. Frank H. Heitger, Indianapolis, Ind., assignor to Heitger Carburetter Company, a Company organized in Indiana. Filed Aug. 24, 1907. Serial No. 389,976.



1. In a carburetter, the combination with a fluid fuel supplying nozzle, a valve seat situated at the top end of the latter, a throat surrounding the top end of said nozzle, an air admission nozzle extending downwardly from the open base end of said throat and terminating in an enlarged air inlet end, an ejecting nozzle extending from the top outlet end of said throat terminating in an enlarged ejecting end, and an air deflecting collar on the top end of said fluid fuel supplying nozzle having its under surface inclined and situated to be approximately parallel with the inner lower surface of said throat, of a valve stem, a valve coacting with said valve seat on the end of said stem, a deflecting collar situated on said stem above said valve having its flat under surface situated to be impinged against by the outflowing jet of fluid fuel from the fluid fuel supplying nozzle.

900,757. Engine. Frank J. Miller, Cleveland, Ohio. Filed Dec. 12, 1906. Serial No. 347,478.

1. In an explosive engine, the combina-

900,763. Non-Explosive Closure for Tanks. William H. McNutt, New York, N. Y., assignor to William E. Roche, New York, N. Y. Filed Nov. 19, 1906. Serial No. 343,991.

1. A closure for tanks comprising a bushing provided with an annular shouldered portion at its outer part, a closure disc located in said shouldered portion and of less diameter than the shouldered portion, the disc being provided with an annular channel in its periphery, the opposite wall of the shouldered portion being also provided with an annular channel, a fusible ring arranged between the periphery of the disc and the channel portion whereby the disc is normally locked in position, the bushing having its aperture threaded at one portion, a plurality of apertured diaphragms extending across the aperture, ring members separating the diaphragms at their margins, and a ring nut threaded in the aperture of said bushing clamping the diaphragm and ring members in position.

800,764. Safety Filler Can. William H. McNutt, New York, N. Y., assignor to William E. Roche, New York, N. Y. Filed Dec. 10, 1906. Serial No. 347,224.

1. In a filler can, the combination of a can, an outlet for the can, a valve controlling the outlet, a valve seat member providing an air vent at the upper portion of the can, a plug valve rotatable in the valve seat, an arm secured to the plug valve, a spring organized to close the plug valve, and a link connecting the spout valve with said arm whereby the closing of the plug valve by its spring will close the outlet valve and lock it in such position.

900,765. Cartridge System for Explosive Engines. William H. McNutt, New York, N. Y., assignor to William E. Roche, New York, N. Y. Filed Jan. 14, 1907. Serial No. 352,110.

1. The combination of the cartridge vessel having a conical lower end terminating in a plug, the plug having a conical extremity and provided with a threaded portion above said extremity, a sleeve member comprising a body portion and a flange portion adapted for attachment to a receiving vessel, a sleeve member having a threaded portion in its upper end, and a conical portion below the threaded portion corresponding in shape to the said plug for attachment thereto, the sleeve having a chambered portion in its lower end, a valve at the upper part of the chambered portion arranged to close the opening, a spring in the chambered portion arranged to engage the valve and yieldably retain it seated, and fingers attached to the valve and projecting into the plug engaging portion causing the valve to be automatically opened and retained open when the plug is secured in the bushing.

900,779. Automobile Spring. William R. Rantz, Greenville, Ohio. Filed Nov. 13, 1907. Serial No. 402,007.

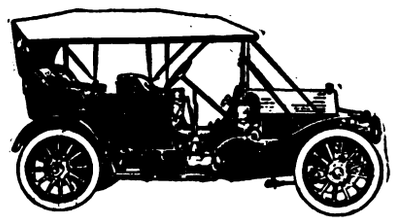
1. A device of the kind described comprising three spring pressed piston rods, one of said rods being arranged below and between the others, and curved levers pivotally connected intermediate their ends and having their end portions loosely connected to said piston rods.

900,785. Vehicle Tire Protector. James E. Rabinson, Chicago, Ill. Filed Dec. 20, 1906. Serial No. 348,684.

1. In combination, a vehicle wheel provided with a pneumatic tire, an axle therefor, a pulley in the plane of but separated from said vehicle wheel, a support for said pulley, associated with the axle for movement therewith and a tire protecting belt running over said tire and said pulley.

901,081. Clutch Mechanism. Herman Dock, Westerly, R. I., assignor to Dock Gas Company, New York, N. Y., a Corporation of New Jersey. Filed Jan. 9, 1908. Serial No. 410,007.

1. In a clutch, a divided clutch ring, a support and anchorage therefor, means cooperating with both ends of said ring to expand the same, said ring anchorage having an inclined bearing for said ring on that side adjacent to the operating means.



901,180. Transmission Mechanism for Motor Vehicles. Charles M. Leech, Lima, Ohio. Filed Feb. 5, 1907. Serial No. 355,829.

1. The combination of a driving shaft, shafts having opposed level wheels at the opposite sides of the driving shaft, means providing for a lateral, yielding movement of said shafts, opposed bevel wheels fixed to the driving shaft between said first named wheels, and means for reciprocating the driving shaft.

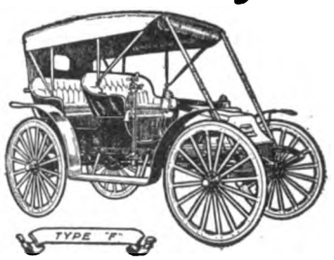
Stevens-Duryea
SIX CYLINDER Y TOURING CAR

STEVENS-DURYEA experience and uniform successes as regards Six Cylinder Cars naturally implies that the latest creation will meet with a wide demand and prove its intrinsic merit.

The Six Cylinder Model Y possesses all the original time-tried Stevens-Duryea features coupled with the improvements and refinements of standardized, accepted designs.



We emphasize that we are more than ever convinced of the decided superiority of six cylinders in higher horsepowers.

PRICE, MODEL Y $4,000

THE Reliable Dayton Line

$925 (Without top)

The Reliable Dayton Has "Made Good"

IT is not a $75.00 buggy with a $50.00 motor in it, but it is a MOTOR CAR from the ground up. Is making business for itself in every territory it invades, through its economical features, compared with the pneumatic-tire car.

Let us refer you to several of the company's largest dealers, who have handled the Reliable Dayton the past year; let them tell you their experience. Investigate; get the facts.

Drop us a line for our agency proposition today.

Our Catalog is different. Let us send you a copy.

When It Snows!

WEEDS On All Four Wheels

They enable the driver to steer easily and without effort. The The car responds to the slightest turn of the wheel if four chains are used.

WEED CHAINS

are absolutely necessary. They prevent lost traction on snow-covered roads or in heavy drifts —they HOLD the road wheels and make it possible for the heaviest car to easily negotiate the worst road conditions.

See our exhibit at Madison Square Garden.

WEED CHAIN TIRE GRIP CO.
35 Moore Street, New York.

THE BIG HIT

of the automobile shows is the Firestone Non-Skid tire.

Its all-rubber tread presents a mass of angles, edges and points of road contact that PREVENTS skidding.

An unusually large wearing surface of the toughest possible rubber insures LONG LIFE.

More of them were exhibited on American cars at the Palace Show than all OTHER NON-SKIDS COMBINED.

FIRESTONE TIRE & RUBBER CO., Akron, Ohio

THE ART OF THE SPECIALIST

finds its fullest expression in the new

Baldwin Improved Detachable Chain

Absolutely correct mechanically, it is made exactly to scale and can be depended on under all conditions of service.

The detachable feature of the Baldwin Chain is an improvement of note. It may be run at the highest rates of speed without the separating of the clips shown at "B." These clips can be removed and replaced without injury, and as easily as the cotter pin. We furnish with each chain a tool shown in "C" for removing the clips, which, while not absolutely necessary, facilitates removal and replacement.

Pat. Oct. 27, '08.

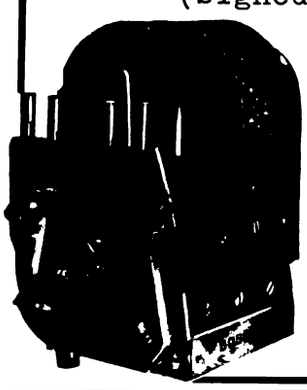
About the BOSCH MAGNETO



with which his Fiat car (Winner of the Grand Prize at Savannah) was equipped.

New York, December 1, 1908.
THE BOSCH MAGNETO COMPANY,
223-225 West 46th St., City.

Gentlemen: I herewith wish to express my appreciation for the high work performed by the BOSCH MAGNETO installed on my Fiat car, with which I won the Grand Prize Race at Savannah, November 26th, 1908. It has not given a single instance of trouble, and the splendid record of BOSCH IGNITION is thereby once more duly confirmed.

No doubt I owe my victory in a good measure to the perfect working of the BOSCH MAGNETO. Yours very truly,

(Signed), LOUIS WAGNER.

The Warner Auto-Meter

Guaranteed Absolutely Accurate

Is the only Speed Indicator made on the Magnetic Induction Principle—the only principle which makes possible the accurate indication of EVERY VARIATION of speed from zero to maximum. All other indicators, because built on the centrifugal principle, fail to indicate any speed whatever under 5 to 10 miles per hour.

The Auto-Meter so solidly and durably built that practical tests have shown that it will endure a MILLION MILES of riding—subject to continuous jolts—without showing perceptible wear or departing from absolute accuracy more than 10 FEET TO THE MILE. Other instruments quickly become so grossly inaccurate as to be worthless.

There are only two moving parts in the Auto-Meter. These revolve—one on double sapphire bearings, the other on Imported Hoffman Balls. There are no little cams of soft brass, no spiral springs, no delicate parts and NO SLIDING FRICTION in the Auto-Meter. It is built like an expensive Chronometer by the same men using the same costly machines. It is accurate when you get it and will STAY so as long as you have a car to use it on.

We urge comparative tests. Use the Auto-Meter on one side of your dash and any other instrument at **any price** on the other. Then use your watch over a measured course and keep the instrument which **tells the truth.** The Warner Auto-Meter is the only accurate speed indicator made and this test will enable you to KNOW it.

THE MARMON

"A Mechanical Masterpiece"

Marmon "Thirty-two", $2400

An Automobile Classic—A Conspicuous Value

The Marmon "Thirty-two" is neither a cheaply-built car at a low price, nor a "good enough" car at a high price.

It is a high grade car in every sense of the word, built as carefully as a fine watch. The parts are interchangeable, all of them manufactured by us, rigidly tested and carefully assembled into a harmonious whole.

Weighing not over 2,100 pounds, with 32-40 H. P., this "Thirty-two" has a world of speed and ability. In performance, as in appearance, it is a car that needs no apologies—occasions no regrets—a car you will be proud to own.

The "Thirty-two" sustains the Marmon reputation for mechanical excellence. It can be depended upon to stand up under the most severe usage, year after year.

To the man who looks ahead and buys with his eyes wide open, this car is an emphatic bargain. No other car on the market at $3,500 or less offers so much actual value.

Get the specifications, notice the character of design and equipment, and make a few careful comparisons.

Genuine Krupp and Chrome Nickel Steels are used for important parts. Bosch magneto and battery—dual system. Three point motor support. Straight line shaft drive. Rear axle and transmission in one unit. Marmon oiling system. Large brakes. Hess-Bright imported ball bearings. Big tires (34x4 all around). Complete equipment. Furnished as Touring Car, Roadster, Suburban, Coupe, or Limousine Town Car.

The Marmon "Fifty," $3750

A superb car, of most distinguished appearance. In hard, practical cash value, it is the superior of the most famous foreign cars selling at two or three times the price. Furnished with seven-passenger body. 50-60 H. P. Completely equipped.

Marmon "Forty-five" Roadster, a special model, $3,500

The 1909 Marmon Models will be exhibited at the Chicago Show, Feb. 6-13

Now

for it's only a postponement at best. Why not take a double-twist on the forelock of old Father Time and incorporate the use of Columbia Lock Nuts in your construction BEFORE you have occasion for regrets? Columbia Lock Nuts are in general use and are regarded as a necessity by some of the biggest railroad systems in the country. They ought to be a double necessity on automobiles. They are already used by many prominent makers. They should be used on every automobile everywhere.

¶Columbia Lock Nuts simply cannot work loose. Vibration, even the constant vibration of solid tires, cannot affect or loosen them. They are automobile insurance of the very best kind and their cost is not a factor. Let us prove our case.

Three Mathesons Win

FIRST, THIRD and FOURTH PLACES

In capturing MacDONALD & CAMPBELL $600 Cup

300 Miles Mid-Winter Contest

FROM PHILADELPHIA TO WILKESBARRE AND RETURN

Over the Pocono Mountains, making also the highest team score against a field of

32 CONTESTANTS

including these cars: 2 Peerless, 1 Stearns, 1 Studebaker, 2 Cadillacs, 1 Acme, 3 Stoddard-Daytons, 1 Elmore, 2 Franklins, 3 Mitchells, 2 Wintons, 3 Oldsmobiles, 2 Maxwells, 2 Knoxes, 2 Ramblers, 1 Buick, 1 Premier.

Only three of the 32 cars had perfect time scores and these three were Mathesons.

No. 7 Matheson Wins First Place

For MacDonald & Campbell $600 Cup

This car, owned and entered by Mr. F. M. Kirby, Wilkesbarre, Pa., and driven by Mr. Kirby's chauffeur, William Miller, is a regular stock Matheson touring car which Mr. Kirby had driven over 7,000 miles prior to entering it in the contest. Actual running time, 5 hours and 31 minutes, breaking all previous records.

No. 15 Matheson Wins Third Place

This car, entered and driven by Mr. Ross Anderson, Wilkesbarre, Pa., was a regular stock Matheson touring car which had covered 18,000 miles in service prior to entering this contest. Actual running time, 6 hours and 4 minutes; also new record time.

No. 6 Matheson Wins Fourth Place

This car, entered by ourselves, was a regular stock Matheson touring car which had covered over 12,000 miles in service prior to entering this contest. Actual running time, 5 hours and 24 minutes, the fastest time ever made by any car over this course, Summer or Winter.

ALL THREE MATHESONS FINISHED WITH ABSOLUTELY PERFECT ROAD SCORES, MAKING EVERY CONTROL ON TIME.

Only one stop was made on account of tire trouble, proving our claim that the Matheson Car, due to its beautiful balance, chain drive and multiple disc clutch, is the easiest car on tires. Our customers usually cover from 5,000 to 10,000 miles on their original tires.

THE CONCLUSION: **The Matheson Car has proved in every endurance run it has entered that it is far and away the most reliable and serviceable as well as the most economical and fastest touring car in all the world**

AND THIS IS ALSO OUR GUARANTY

The extra trouble and expense we put on

MORGAN & WRIGHT TIRES

before they leave the factory will take the place of the trouble and expense you have been accustomed to put on your tires when they were in service.

We attribute a large measure of the success of our tires to our system of inspection—starting with the testing of the pure Para gum and Sea Island cotton fabrics—continuing up thru the processes of compounding, frictioning and building—and ending only when the finished tire has been pounded, stretched, turned inside out and put thru every conceivable test that will develop imperfections if any are ever to develop.

You can materially reduce your car maintenance bills by letting us bear the expense of proving the quality of your tires.

And they cost no more than other brands.

TIMKEN

New One-Piece Pressed Steel Power Axle

¶ The new Timken Axles as shown in the illustrations herewith, is a one piece pressed steel form, shaped to give better than truss resistance to load, end thrust and breaking strains, and eliminate the vibration common to cast steel or forged axles of the built up type.

¶ The entire housing is a load bearing and gear encasing member in a single unit, clear and smooth, without angles or protruding parts, supports or braces, with nothing to vibrate, nothing to rattle, nothing to work loose, nothing to catch mud and easy to clean.

¶ The power unit (differential bearings and adjustments for same, pinion shaft and bearings, drive and pinion gears), is a compact unit that can be removed bodily from the axle case or housing, without taking down the axles or disturbing brake equipment, springs, hubs or bearings.

¶ The axle, complete with differential gear carrier, brakes and spring seats, is made in both clutch and fixed type hubs for cars weighing from 1,500 to 3,000 pounds empty, and 45 horsepower or less. See these new axles at the Timken exhibit at the Shows, or write direct for illustrated descriptive matter.

We will exhibit Madison Square Garden, January 16th-23rd; Chicago, February 6th-13th

Continental

America's Best Pneumatic Tire

OWNERS DEMAND THEM

Experienced automobile owners **insist** upon Continental tires as the equipment for their cars. They know that these tires outwear and cause less trouble than **all** others. It is wise to take the advice of those that have **thoroughly tried** and **found out** rather than to accept "any old" tire which may be offered. Continental tires will do away with large tire bills, assure safety and obviate trouble and worry.

DEALERS RECOMMEND THEM

All the best dealers throughout the country recommend Continental tires and carry all styles and sizes in stock. They know that Continental tires are manufactured of the **best** material obtainable that automobilists' requirements are met with and satisfied customers are thus assured. No long delays—there and back again without continually stopping for tire changes.

MANUFACTURERS SUPPLY THEM

All the largest manufacturers of automobiles equip their cars with Continental tires whenever requested at no extra cost—others use them as regular equipment. These manufacturers by experience have found out the good qualities of Continental Tires. In offering Continental Tires we have combined the owners, dealers, and manufacturers' requirements—the results **"America's Best Pneumatic Tires."**

CONTINENTAL READY-FLATED TIRES

Continental tires or any other standard clincher tire can be fitted on our demountable rims and carried already inflated on spare rims. When trouble is met with, remove the damaged tire and replace it with an already inflated tire, taking almost no time. We guarantee this equipment to the extent that if not perfectly satisfactory original replaced at no cost to the purchaser.

Write for our latest booklet entitled "Continental Ready-Flated Tires" and prices.

THE SELDEN CAR

MADE BY

"The Father of Them All"

One Price, $2,000. F. O. B. Rochester.

TOURING CAR, ROADSTER, TOY TONNEAU

A genuinely good car cannot be made and sold for less than $2,000. By this we mean a car like the Selden, containing nothing but the best of materials, workmanship and finish. A car that the manufacturer can stand behind and guarantee for at least a year against any imperfections in workmanship or material.

We buy only the best materials, employ only skilled labor and pay particular attention to details and finish, thereby producing a strictly high-grade car at the lowest possible price.

The up-keep and maintenance of a medium-priced car like the Selden is within the reach of any man of moderate means and the value of the car does not depreciate like that of the lower priced cars. This is the point to be considered by every purchaser.

The Selden Car is a 4-cylinder 28-30 horsepower (developing 37 horsepower) five passenger Touring Car or three passenger Roadster, with 114-inch wheel base, 34-inch wheels, shaft drive, selective control, pressed steel frame, metal body, fully equipped.

Superb riding, roomy tonneau, luxurious upholstery, smooth running, great hill-climber, flexible and easily handled, economical in maintenance and up-keep, fine finish, stylish and attractive.

THE COMING CAR OF MODERATE PRICE

Catalog and Agency proposition upon request. Agencies wanted everywhere.

We will exhibit at Madison Square Garden Show.

This Tire Will Give You The Best Service

There may be other tires on the market that probably look from outside appearance to be as good as the G & J, but if you will get sections of the different tires and compare the quality of rubber, its toughness, and the manner in which it is embedded into the meshes of the fabric you will note there is a difference. After making this comparison and also noting carefully the general construction, you will not wonder why so many are specifying G & J Tires.

If there is one time more than another to get down to business it is when you buy a runabout.

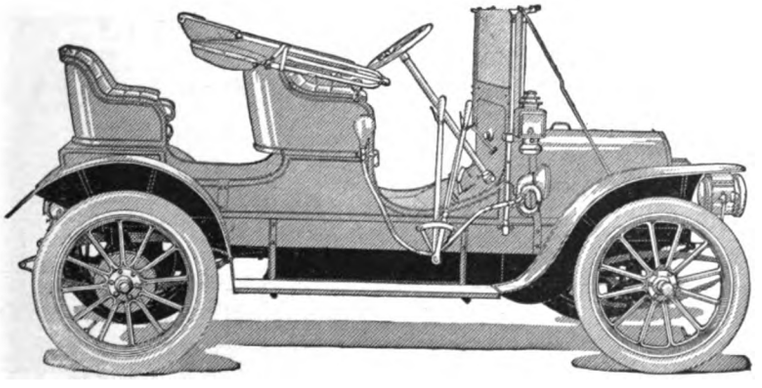
No argument there. **You want what you want.** You want service; you want it day in and day out—every day, cold or hot. You want economy too.

You want a real *runabout*—one scientifically designed for the work it has to do. You do not want a cross between a touring-car and a roadster—something that is half one thing and half another. You want a runabout, a handy comfortable vehicle.

Franklin Model G runabout is built in three types—for two, three or four passengers. The original Franklin automobile was a runabout. Model G is the direct descendant—refined, stronger, more powerful, longer lived, and in design right up to the minute—a runabout all through.

The standard finish is a combination of rich red and black—not glaring, but striking and attractive; and the colors are durable.

Model G runabout has full elliptic springs of extra length front and back. The chassis frame is wood, laminated. This construction overcomes jolting and jarring and makes comfortable riding on all roads. It has 32" wheels, as large as used on many touring-cars. Large wheels give road smoothness; and the greater the diameter of wheels the longer the tires last.



The wheel base of Model G runabout is 91½"—the correct length for maximum comfort over rough pavements and bumpy roads, and yet not too long for compactness and manageability. It is readily turned around in an ordinary city street without backing. It handles and controls easily under all circumstances. The rear seats are designed for use, and with the full elliptic spring suspension and non-jarring Franklin construction they are comfortable to ride in—far more comfortable even than the tonneau of a touring-car with half elliptic springs and steel chassis frame.

And Model G runabout is light weight. Its light weight begins with its air-cooled motor. All the weight of water and water-cooling apparatus is dispensed with. There is not anything to leak nor to freeze. You can leave Model G runabout standing in any weather and find it always ready. You do not have to bother with "anti-freezing solutions" or worry about leakage.

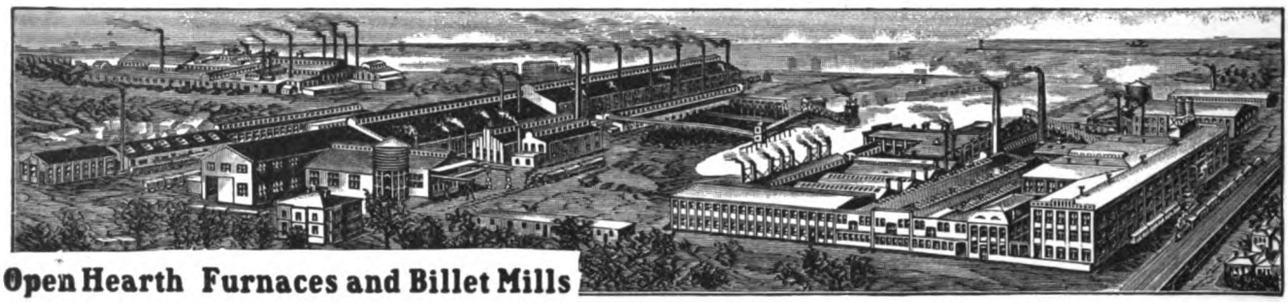
Every Franklin motor by means of an auxiliary cylinder exhaust and sheet metal radiating flanges is cooled by air without the aid of water. Therefore, Model G runabout is not subject to disablement due to leakage, boiling or freezing. It gives you service day in and day out, cold or hot. Its light weight does away with the usual worry about tires.

Altogether Model G is the ideal runabout. Its 18 horse-power air-cooled engine gives it more ability than many water-cooled machines of much higher horse-power rating. Any Franklin dealer will show you.

Our new 40 page catalogue shows the entire Franklin line—four-cylinder and six-cylinder runabouts and touring-cars. Every automobilist ought to have this book. But the edition is limited and we send it only to those who ask.

Franklin Model G Runabout

18 horsepower, four-cylinder long stroke air-cooled motor. Multiple disc clutch, sliding gear transmission, shaft drive, Bosch high tension magneto.



With single or double rear seat $1800. As a two-passenger vehicle with hamper $1750. Top extra.

PLEASE ADDRESS ALL COMMUNICATIONS TO THE COMPANY

Indianapolis, Ind. 10-31-08.

Barthel & Daly,
42 Broadway,
New York, N.Y.

Gentlemen:-

Early last Spring we received from you a partial set consisting of two #315, and #306 and one #308 Schafer Annulax bearings.

These bearings were used on the writer's air-cylinder car, #315 bearings being used carrying the load on the rear axle, and one #306 and one #308 being used in one of the front wheels.

They were run about 1200 miles in the car above mentioned, and were afterward put in the Premier Company's Mover entry which received a perfect score in the Glidden Tour, this car being driven by the writer. This Tour included the drive back to Indianapolis, giving us 2400 miles additional.

On returning from the Glidden, these bearings were again put into the writer's personal car for further test.

They were recently taken out and examined after having had a total mileage of about 7000 miles and were found in thoroughly good condition.

We have looked well into the question of material and workmanship of the Schafer bearings, and this in addition to the larger number of balls than are used in the average annular bearing probably has a great deal to do with the very excellent showing which these bearings have made.

Yours very truly,
PREMIER MOTOR MFG. CO.

Stearns

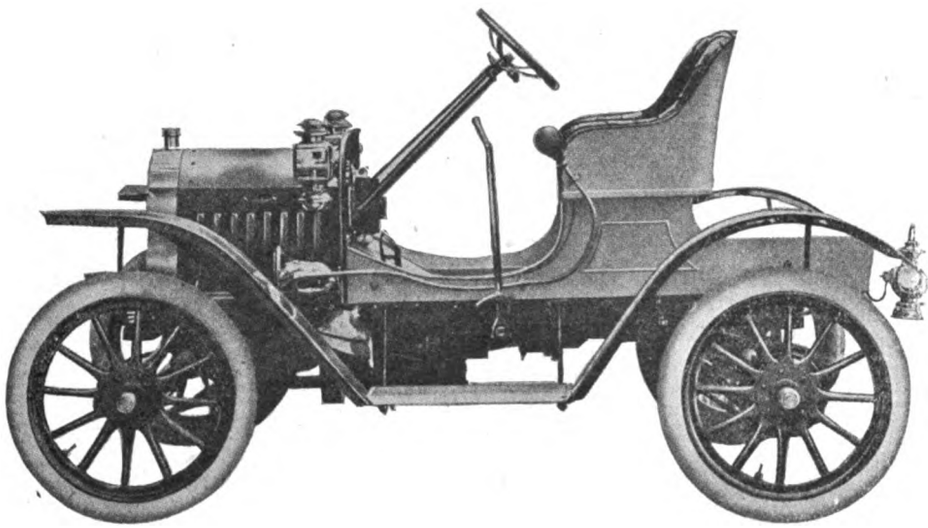
GOOD design; a careful selection of scientifically tested materials; the exercise of greatest care in the manufacture of component parts; painstaking skill in their assembly, and a system of final inspection so comprehensive and complete that anything under 100 per cent. perfect cannot get through—that's Stearns production.

¶ Our new 15-30 is for those who would have a strictly high quality car at price and of power somewhat under the 30-60 horsepower model.

¶ Catalogued at 15-30 it develops close to 40 horsepower and, while of comparative light weight, is so staunch and sturdy that it will "stand up," as a good car should, even under unusual conditions of service.

¶ And, like our 30-60 (which is accepted as the standard of excellence in America), this new 15-30 model represents extreme high quality in every line and fiber.

¶ It is shaft drive, and designed to accommodate town and touring bodies.



¶ In our 30-60 horsepower model purchasers are given side chain or shaft drive option.

¶ Demonstration by appointment.

Brush Runabout

Model B
$500 ▭ $550

Delivery Wagon
$600

SEE US AT THE CHICAGO SHOW, FEBRUARY 6th—13th

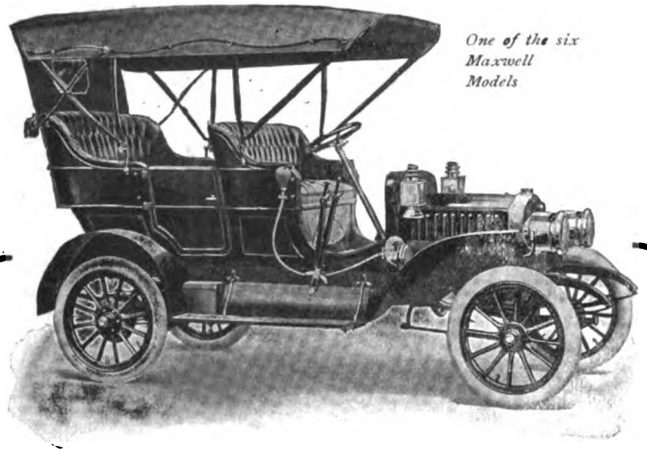
In a certain Michigan town of 1200 inhabitants a live business man took the Brush Runabout agency last August. So far we have shipped him 12 cars and have (at this writing) his order for another carload of 6.

A Western dealer contracted 100 cars for his town for the balance of this Fall and all of next season. Up to December 15 we had shipped him four carloads of 10 each, or 40 cars, with more on order.

Another dealer has taken 60 cars since September.

A small car is a much harder engineering and manufacturing problem than a big car. We have been through the mill. Since the start there have been four years of effort put on the Brush Runabout—one year of experiments, one of designing and testing, one of manufacturing organization and public tryout and one of general use.

It is no dream or hope. We need no dogs to try it on.



The car is right because people who drive it find it so. The price is not going up nor the quality down, because we KNOW our costs, basing that knowledge on actual past experience in quantity production of THIS CAR. We CAN AFFORD to make every piece in it good. The car sells. Note we don't say "will sell." IT IS SELLING. The profit STICKS TO THE DEALER because he doesn't have to spend it all in free repairs.

Do YOU want territory on it? Some of the most prominent dealers are selling it. It is the BUSINESS MAN we wish to tie up to.

One of the six Maxwell Models

THE FAMILY NECESSITY CAR.
Model HD. 2-cyl., 20 H.P., five-passenger touring car. Complete, with magneto, top, gas lamps and generator. Price $1,450.

It has been Our Ideal to make the "Maxwell"

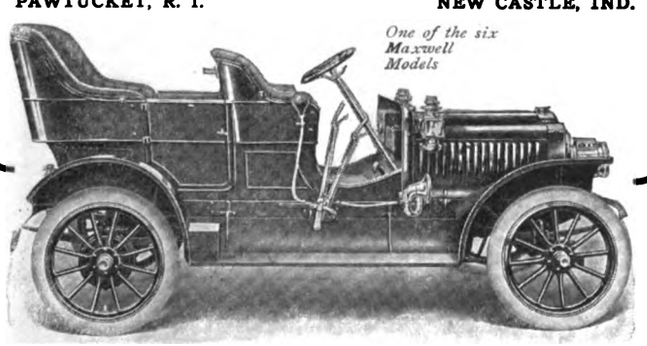
the best moderate-priced car. To this we have been faithful by refusing to compete in price with every experiment.

Our aim has been to build the best, then set the cost—not to skimp and cut for the mere sake of price sensationalism. Quality has been our first consideration—to make the Maxwell the "Aristocrat of Moderate-Priced Cars"—our ambition.

12,000 satisfied Maxwell owners is the proof of our success—each enthusiastic and ready to "stand sponsor" for the Maxwell claims.

WHAT ARE THESE MAXWELL CLAIMS?

that though moderate in price, Maxwell cars are made under the same rigid inspection, of as high-grade material and workmanship, and are as durable as should be the best high-priced cars.



We have never manufactured cheap cars—on the other hand, we have never gone to the other extreme to make the enjoyment of automobiling a luxury of prohibited expense.

As a result, Maxwell cars will endure beyond the attempts of the makers of cheap automobiles to "paper-claim" themselves into our class.

Send for our 1909 catalog now.

Don't Guess Which Tire Is Best—Here Is Proof

In New York City there are 1,000 Taxicabs.

On the tires, more than on any other one thing, depends the profit of the Taxicab business.

You may be sure that the owners of the 1,000 Taxicabs did not GUESS.

They TRIED all the tires that were offered, and checked them up with the TAXIMETER—which told them the mileage unerringly, indisputably.

There was no personal preference. No friendship. No prejudice. It was a cold-blooded BUSINESS test.

And the result: 800 out of the 1,000 Taxicabs in New York, operated by several competing owners, have contracted for Goodyear Tires to be used EXCLUSIVELY.

GOODYEAR

To understand why the Goodyear Tire stood head and shoulders above its competitors in this Taxicab test, you must understand, first, the difference between a *moulded* tire and a *wrapped tread* tire.

The moulded tire is built up, layer by layer, on an iron core. Over it is clamped an iron mould. When the heat of the curing process is applied, that rubber expands—and in expanding, forces a perfect union between the various layers of rubber and of fabric.

With the moulded tire, so far so good.

But in building up that tire on its iron core, a skilled workman lays fabric on fabric, rubber on rubber.

Yet, skilled as he may be, he cannot wholly avoid wrinkles, irregularities, unevenness, which, under the pressure of curing, multiply themselves into *hidden* weaknesses and defects.

Some tires, instead of being cured on an iron core, are cured on an *air bag*, which is really an extra strong inner tube.

When the air bag has been inserted in the built-up tire, strong tape is wound around it, and then it is cured in live steam.

The advantage of the wrapped tread process is that the air bag, full of compressed air, smoothes out these wrinkles and irregularities and prevents those hidden weaknesses and defects.

The advantage of the wrapped tread process is, for this reason, immeasurable.

But the tire made by this process does not get the *terrific squeeze* that the moulded tire gets when the heat expands it between core and mould—the squeeze that forces the rubber into the fabric, making a perfect union between fabric and rubber.

In losing that squeeze, it loses durability, strength, unity—which more than offsets the fact that the wrapped tread tire can have no hidden wrinkles or unevenness.

Obviously, the tire you ought to have is the one which is built up on an iron core, *squeezed* the same as a moulded tire—and *finished* on an air bag to smooth out the irregularities.

There is just one tire made in this way—*only one*. It is the Goodyear Quick Detachable.

This one point of superiority is reason enough why the Goodyear Quick Detachable should have won the Taxicab test.

But there are other reasons—other superiorities.

The Goodyear Quick Detachable is, for example, an *oversize* tire.

The Goodyear tire is made larger than the specifications call for. It is simply 15% larger than any other tire marked the same size.

Among the countless other Goodyear superiorities is the patent rubber-rivet breaker-strip, which makes it impossible for the tread to split or peel from the carcass of the tire.

Goodyear superiorities extend from the raw materials to the workmanship—from scores of exclusive Goodyear processes to the Goodyear piano-wire tape which would hold the tire on the rim, even if both the detachable flanges were off.

When you think of tires, think of that Taxicab test.

Those 800 Taxicabs in New York are doing 60,000,000 tire miles a year!

More than 1,000,000 tire miles a week!

And what is true of the Taxicabs of New York is equally true of practically every large Eastern city where Taxicabs are used.

Eight out of every ten of them are using Goodyear tires exclusively.

Think of that, you who have bought tires because you have heard of their use on some tour or some race!

Think of that, you who blindly groped at the tire problem—you who have bought tires wholly by hearsay!

Don't you see, now, that tire-buying has been reduced to a *business* basis?

Isn't the tire that the Taxicab took—isn't *that* the tire for you?

A hundred times more about tires than can be explained here, can be found in our book, "How to Select an Auto Tire."

Send for it now. It is free.

Long Life is what every motorist wants in his car

If it is a

CORBIN

imported ball bearings, used wherever practical, assure him of this result. Ask owners of Corbin Cars how they stand up in every day use or write for our testimonial booklet.

THE CORBIN MOTOR VEHICLE CORPORATION, New Britain, Conn.

Members Association Licensed Automobile Manufacturers.

Will exhibit at Madison Square Garden Show, January 16-23, 1909.

F&S

Annular Ball Bearings

THE NEW IDEA in ball bearings is to distribute the load among as many balls as possible without reducing the size of the balls—in other words, to fill the races with balls.

Heretofore it has been impossible to realize this ideal in practice because no way was known of introducing more than half a raceful of balls without impairing the continuity of the races. Even were the races filled, commercial limitations of accuracy made it uncertain that all the balls would be loaded alike.

The first problem—that of filling the races—has been solved in the new type

F & S ANNULAR BALL BEARINGS

with die-cast separator. The balls are sprung in through shallow diagonal side slots: once in, they never again touch the slots.

The second problem—that of accuracy—has been solved by F. & S. methods of finishing and sizing the balls. The error in an F. & S. ball bearing is guaranteed not to exceed 1-10000 inch.

THE GARDEN SHOW

joins with the Palace Show in reflecting the fast-growing prestige of

"Firestone"

TIRES

Their advance into third place in equipment at both auto shows again emphasizes the oft-noted preference away from the ordinary popular-priced tires in favor of the best possible tire service.

MORE FIRESTONE NON-SKIDS were shown on American-made cars than any other two non-skids combined.

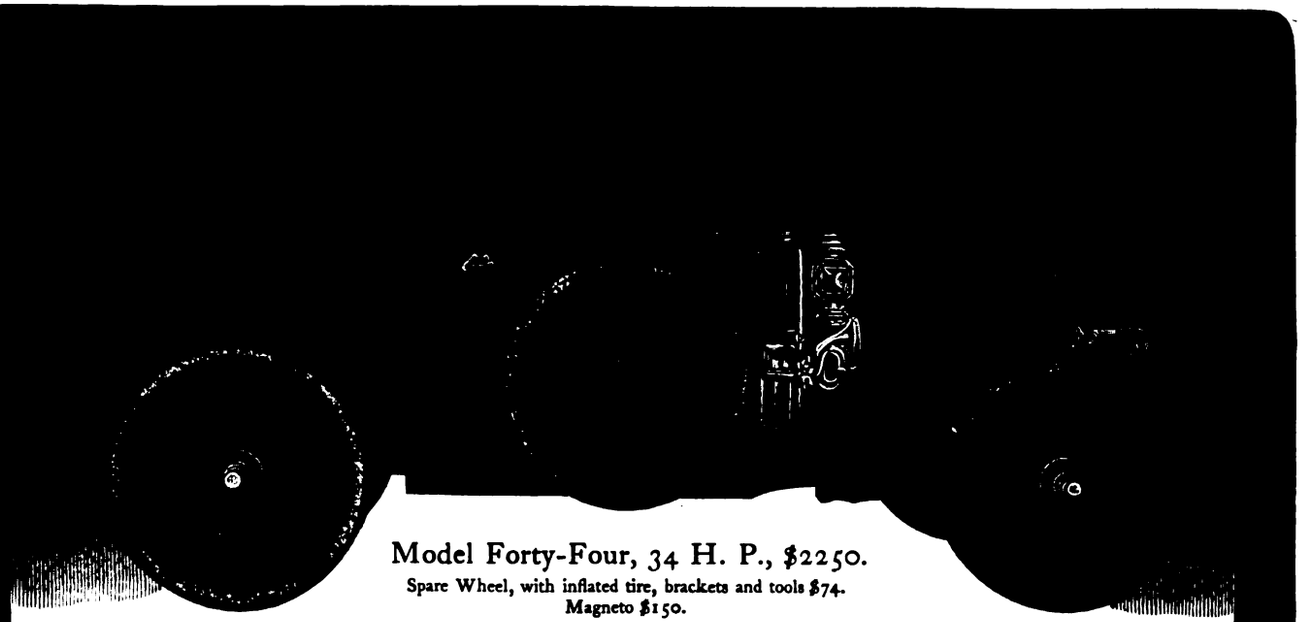
In the commercial vehicle section Firestone Side-Wire tires, as usual, outnumbered nearest competition more than six to one.

FIRESTONE TIRE & RUBBER COMPANY, Akron, Ohio

IT WILL PAY YOU TO INVESTIGATE

THE **1909** *National*

THE LINE IS BETTER AND MORE OOMPLETE THAN EVER



Model 9-35, 4-cyl., 4¾ x 4¾, 5-passenger Touring Car	**$2,750**
Model 9-40, 4-cyl., 5 x 5, 5-passenger Touring Car	**$3,700**
Model 9-50, 6-cyl., 4½ x 4¾, 7-passenger Touring Car	**$4,200**
Model 9-60, 6-cyl., 5 x 5, 7-passenger Touring Car	**$5,000**

Each National has the well-known National Ball-bearing Motor with new crank case oiler, two ignition systems (Bosch Magneto and Storage Battery) and all other tried and proven features of high grade modern motor car construction. Any of the above models can be furnished with Baby Tonneau body or as a Roadster.

Write for distributors terms and full particulars.

NATIONAL MOTOR VEHICLE CO., 1007 East Twenty-Second St. INDIANAPOLIS, IND.

Model Forty-Four, 34 H. P., $2250.
Spare Wheel, with inflated tire, brackets and tools $74.
Magneto $150.

THE SAFETY SPARK RETARDER

There is absolutely no danger in cranking a Rambler when properly adjusted. The starting crank then cannot engage until the spark has been automatically retarded.

Every one who has had the unpleasant experience of a premature spark in starting an automobile will appreciate the Rambler safety starting device. This prevents an explosion ahead of center, even though the operator forgets to retard the spark.

You cannot engage the lug on the shaft with a tooth on the starting crank until the spark-retarder lever has moved from the position of the dotted line to the position shown, thus retarding the spark.

Rambler

The Car with the Offset Crank Shaft

Seven passenger model, forty-five horse power with offset crank shaft, $2500. Other models, $1150 to $2500. Write for catalog describing in detail Rambler offset crank shaft, Spare Wheel, straight line drive and other exclusive features of the new Rambler models.

THE CAR OF STEADY SERVICE

APPERSON BUYS POPE-TOLEDO

Virginia Capitalist Acquires the Plant and Business—May Transplant the Enterprise to the South.

After an apparent breaking off of negotiations, Richard D. Apperson, of Lynchburg, Va., together with a group of associates, has purchased the Pope Motor Car plant at Toledo, O., and will head a company to be known as the Apperson-Toledo Motor Co. The business, patents, trade names and good will are included in the purchase, which was made from the Toledo Motor Co., that recently took over the property from the Pope Motor Car Co.'s receivers. The new company, of which Apperson will be the president, proposes to manufacture "licensed" cars of the same type as the latest Pope-Toledo models, but they will be marketed as "The Toledo", with very full equipment a feature.

Despite his name, Apperson is not related to anyone at present engaged in the automobile industry, and is not to be confused with the well known automobile manufacturers of Kokomo, Ind. His chief business interests are in electric, gas, water-power and traction companies in the South and elsewhere, in which he is both a heavy stockholder and a director.

It is indicated that not only Apperson's own city of Lynchburg, but Richmond, Baltimore and other localities have made generous offers of stock subscriptions, free plants and power for the enterprise. He intimates, however, that Toledo is to be offered stock in the new company, and that if the response is as great as is hoped for, the cars will be made at the Toledo plant, with that city as the concern's headquarters.

Jewel Reorganizes and Expands.

With an increase in the capitalization to $250,000 the Forest City Motor Car Co., of Massillon, O., has been reorganized as the Jewel Motor Car Co., to continue the manufacture of Jewel cars. The change also involves the absorption of the Keaton Taxicab Co., of Detroit, Mich., whose product, the Keaton taximeter cab, the Jewel company will hereafter make. F. M. Keaton, of the Detroit concern, will act as a designer for the new company, of which H. A. Croxton will be president and treasurer, while O. P. Bernhart will retain his position as secretary and general manager. The Jewel line for the coming season will include, beside the cab, a 7 passenger touring car, a limousine, a roadster and a baby tonneau, together with a limited production of the early type Jewel 2-cycle cars.

Through with the Old Pierce Company.

Great surprise and considerable speculation were created on Wednesday of this week by the mysterious announcement that Colonel Charles Clifton and other of its officers were "through with the George N. Pierce Co." The announcement proved to be true, but only in the sense that the famous Buffalo concern has changed its name, and will hereafter be known as the Pierce Arrow Motor Car Co. Accompanying the change in name, a considerable increase in the capitalization has been made, commensurate with the enormous business which has grown to be the company's portion. No change, however, takes place in the list of officers or in the working organization.

Plymouth Concern in Hands of Fate.

H. H. Fate, of Plymouth, O., has bought at auction from the trustee in bankruptcy the property of the defunct Commercial Motor Truck Co. He intends to reorganize the business and to continue the manufacture of commercial vehicles. Creditors of the bankrupt concern are given the hope of from 25 to 30 per cent. on their claims.

Palmer Succeeds Birdsall.

E. T. Birdsall having resigned as designer for the Selden Motor Vehicle Co., of Rochester, N. Y., his successor has been appointed in V. M. Palmer. The latter was at one time connected with the Hagerstown plant of the Pope Mfg. Co.

BANQUET AFTER M. A. M. ELECTION

Opposition Ticket and Warm Discussion Add Interest to Meeting—Notable Guests at Dinner.

Promise of an animated session of the Motor and Accessory Manufacturers, Inc., at their annual meeting yesterday in Delmonico's, New York, was only partly materialized. It had been stated that there would be opposition to the re-election of one or more of the four directors whose terms expired and that one of the tire manufacturers who was a party to the now famous Cleveland conference proposed to lay bare the true inwardness of matters connected therewith.

When nominations were called for, opposition candidates were presented, but the administration steam roller was in good working condition and flattened the "insurgents" in short order. The four directors whose terms expired were re-elected by substantial majorities. They are E. S. Fretz, H. T. Dunn, L. M. Wainwright and F. E. Castle. With the hold-over directors, they will select the officers of the organization.

Horace De Lisser, president of the Ajax-Grieb Rubber Co., created the most warmth that was generated at the meeting. It was he who brought up the results of the Cleveland conference. He charged that the chairman of that meeting had in effect generally acted unfairly, had misrepresented the results of the conference and placed in a false light those who opposed his views, and without authority had made use of the minutes of the Cleveland meeting in a manner designed to promote the interests of his own company and to injure those who did not vote with him. He therefore proposed that the M. A. M. pass a vote of reprimand on the chairman in question. The latter was present and made a vigorous response, in the course of which he denounced what he termed the "scurrilous attack" on him. He said it justified him in demanding the

Digitized by Google

resignation of the Ajax-Grieb company, but that he would not make such a demand but would request a vote of censure.

After all had been said, the lever of the steam roller was pulled and the whole matter was disposed of by a ruling of the president that it was out of order.

The reading of the reports of the officers occupied most of the time. The most interesting of these was the report of the treasurer. It showed a balance on hand of $27,000.

The banquet of the Motor and Accessory Manufacturers followed the business meeting and also occurred last evening at Delmonico's. It was largely attended. Those at the guests' table included N. J. Bachelder, Master of the National Grange; Charles Clifton, president A. L. A. M.; Benj. Briscoe, president A. M. C. M. A.; W. H. Hotchkiss, president A. A. A.; H. S. White, president M. A. M.; H. Raymond, first vice-president M. A. M., and A. G. Batchelder, representing the trade press, all of whom spoke. Job E. Hedges acted as toastmaster, and had all the fun that usually goes with that office.

N. A. A. M. Holds Annual Election.

At the annual meeting of the National Association of Automobile Manufacturers, held in New York on Wednesday, the 20th inst., the election of officers was the chief feature of the program. The result of the election was as follows: President, S. D. Waldon, Packard; first vice-president, William E. Metzger, E-M-F.; second vice-president, L. H. Kittridge, Peerless; third vice-president, C. C. Hildebrand, Stevens-Duryea; secretary, Benjamin Briscoe, Maxwell-Briscoe; and treasurer, William R. Innis, Studebaker. The retiring president, Thomas Henderson, of the Winton Motor Carriage Co., was again chosen for a place on the executive committee. The effect of the election was to move all the officers, except Henderson, up one peg.

The board of directors is the same as before, by the re-election of the retiring members, and consists of S. T. Davis, Jr., Locomobile; Charles Clifton, Pierce-Arrow; Thomas Henderson, Winton; William E. Metzger, E-M-F.; S. D. Waldon, Packard; H. O. Smith, Premier; Benjamin Briscoe, Maxwell-Briscoe; L. H. Kittridge, Peerless; William Mitchell Lewis, Mitchell; C. G. Stoddard, Stoddard-Dayton; A. L. Pope, Pope; R. D. Chapin, Chalmers-Detroit; Winsor T. White, White; William R. Innis, Studebaker; and C. C. Hildebrand, Stevens-Duryea. The last five were those whose terms had expired. A balance of about $40.000 was reported in the treasury.

Knight to Serve One Year.

Pleading guilty to receiving stolen automobile tires, Charles H. Knight, the well-to-do president of the Chicago Rubber Tire Co., was sentenced in Chicago, last week, to one year's imprisonment. Two of his youthful thieves were let of lightly.

The Week's Incorporations.

Detroit, Mich.—Great-Iswell Auto Co., under Michigan laws, with $10,500 capital.

Elyria, O.—Elyria Garage Co., The, under Ohio laws, with $15,000 capital. Corporators—Willard Beal, et al.

Camden, N. J.—Woodland Garage, under New Jersey laws, with $50,000 capital. Corporators—Charles C. Henderson, Jr., Howard H. Lukens, Garfield Pancoast.

Kansas City, Mo.—Taxicab and Automobile Co. of Kansas City, under Missouri laws, with $10,000 capital. Corporators—Charles H. Brown, H. M. Hoorheimer, E. F. Weil.

Boston, Mass.—Jackson Automobile Co., of Boston, under Massachusetts laws, with $5,000 capital; general automobile business. Corporators—H. S. Merry, president and treasurer, et al.

New York City, N. Y.—Siemen's Magneto Co., under New York laws, with $50,000 capital; to manufacture electrical machinery, etc. Corporators—F. Nebel, J. Butner, S. S. Meyers, New York City, N. Y.

Jersey City, N. J.—Maxwell-Briscoe Syracuse Co., under New Jersey laws, with $2,000 capital; to manufacture automobiles and other vehicles. Corporators—S. A. Anderson, John R. Turner, H. O. Coughlan.

Newark, N. J.—Adolf Karl Co., The, under New Jersey laws, with $50,000 capital; to manufacture a patented tire powder named "Permanit." Corporators—A. Karl, C. J. Schultz, Newark, N. J.; F. Ardrey, South Orange, N. J.

Hoboken, N. J.—Munsing Motor Car Co., under New Jersey laws, with $1,000,000 capital; to manufacture automobiles, motor and other cars, engines, trucks, etc. Corporators—W. H. Buresmith, J. P. Franklin, C. H. Bellows, Jr., New York City, N. Y.

New York City, N. Y.—Benz Auto Import Co., under New York laws, with $30,000 capital; importing and dealing in automobiles and accessories, etc. Corporators—D. Weingarten, O. Weingarten, New York City, N. Y.; L. Weingarter, Newark, N. J.

Perth Amboy, N. J.—Motor Appliance Co. of America, under New Jersey laws, with $25,000 capital; to manufacture machinery, mechanical devices and engineering appliances, etc. Corporators—J. P. Hall, New York City, N. Y.; A. S. De Veau, Brooklyn, N. Y.; C. C. Sibley, Perth Amboy, N. J.

In the Retail World.

Sam and Walter Ziegler have embarked in the garage business at Junction City, Kan. With the Muenzenmayer Hardware Company they will jointly handle the agency of the Cadillac line.

Having remodelled the building at 917 Hennepin avenue, Minneapolis, Minn., the Mich Automobile Company has removed its headquarters to that place. The move was made on the first of the year.

One of the 1909 improvements in the city of Macon, Ga., was the converting of the old telegraph office on Second street into a garage. G. W. Ellis recently moved in and when the cement floor is completed he will be ready for business.

The Kearney Automobile Company, of Kearney, Neb., has been sold to Lon Franks and Frank Mott of that city. The latter is a local automobile man and Franks was formerly manager of the Kearney gas works. Dan Atchison, the old proprietor of the concern, is retiring from active business.

With the reorganization of the Banker Bros.' Company in Pittsburg, R. P. McCurdy, former sales manager of the company, has been elected vice-president and general manager, succeeding Arthur Banker who retired a short time ago. The other officers of the company are: President, C. M. Miller, and secretary and treasurer, I. G. Davis.

Boston's Big Automobile Fire.

What safely may be described as the biggest fire which at any time has visited an automobile center occurred in Boston just before dawn on Sunday, 17th inst. Within half an hour after the first flames shot up from the rear of the big garage building near Park square, about 400 automobiles, valued between $700,000 and $900,000 were reduced to shapeless masses of junk. The heaviest losses so far as can be ascertained are as follows: Park Square Auto Station, 150 cars, valued at $350,000; Concord Motor Co., 54 cars, valued at $150,000; Thomas B. Jeffery & Co., 44 cars, valued at $125,000; Boston Auto Exchange, 30 cars, valued at $100,000; Mills Transportation Co., 8 cars, valued at $25,000. A number of sightseeing cars and commercial vehicles, owned by various companies and individuals were among the vehicles destroyed, as well as many cars owned by private individuals.

The building first attacked by the fire and in which about a dozen firms were located, was a brick structure, about 600 feet long, 70 feet wide, and one story high, with a slanting roof. There was an entrance to it from Columbus avenue near the old Providence railroad station, and it ran parallel with the old trainshed to Berkeley street.

Rival Shows in Rochester.

Rochester, N. Y., is to have two rival automobile shows. The Automobile and Motor Trades Association of Rochester has been formed to hold an exhibition in Convention hall one week earlier that that given by the Automobile Dealers Association of Rochester, the older organization. Sidney B. Robey and John A. Breyfogle are treasurer and secretacy, respectively.

Comes Across from Coventry.

A. S. Hill, manager of the Coventry Chain Co., Coventry, England, has arrived for a brief American stay. He was a visitor at the Garden show early in the week.

COMMERCIAL ACETYLENE WINS SUIT

Court Decides Avery Portable Lighting Co.'s System Infringes—Claude and Hess Patent Held Valid.

Suit against the Avery Portable Lighting Co., of Milwaukee, Wis., for alleged infringement of its patents, which was brought by the Commercial Acetylene Co., of New York, in the United States Circuit Court for the Eastern District of Wisconsin, was decided in favor of the New York concern in a verdict filed by the court at Milwaukee on the 13th inst. The action was based on an alleged infringement of claims 1, 2 and 6 of what is known as the Claude and Hess Patent No. 664,383, which was issued to Claude and Hess, December 25, 1900.

The patent in question covers the storage of compressed acetylene dissolved in acetone in a tank provided with a suitable valve, and applies to the system in constant use by the owners of the patent for lighting automobile headlights and applied to the Prest-O-Lite tanks which are made and sold under license from the Commercial Acetylene Co. By the court's decision it was held that the three claims in issue were valid and that they had been infringed.

Parker and Hartford Rubber Compromise.

Lewis D. Parker, former president of the Hartford Rubber Works Co., of Hartford, Conn., effected a compromise with that company, last Friday, in his $150,000 damage suit against it. Parker had a five years' contract as manager, a place which carried with it the office of president. After his retirement about four years ago, he sued on the ground of breach of contract, as the contract at that time still had three and a half years to run. The exact terms of the settlement have not been given out, but it is understood that Parker has received about half the amount he would have received in salary for the unexpired period of the contract.

Hart Fails to Acquire the Corbin.

Negotiations for the sale of the Corbin Motor Vehicle Corporation, New Britain, Conn., to its former president, Howard S. Hart, have been declared off, the special committee of the American Hardware Corporation having decided that the latter company had best retain its ownership of the Corbin automobile business. The committee, consisting of Charles Glover, C. H. Parsons and C. H. Baldwin, is of the opinion that under the direction of President Glover the Corbin company will meet with great success, and an aggressive manufacturing and selling policy will be maintained.

Reeves and Chalfant on A. A. A. Board.

Two more tradesmen were placed on the board of directors of the American Automobile Association at the meeting on Wednesday, the 20th inst., Al Reeves, general manager of the American Motor Car Manufacturers' Association, and Edward P. Chalfant, general manager of the Association of Licensed Automobile Manufacturers, being chosen. This makes seven trade members on the board and gives the manufacturing side of the industry large representation.

Remy, Closed by Fire, Quickly Resumes.

Fire completely destroyed the magnet making department and the power plant of the Remy Electric Co., Anderson, Ind., on the 13th inst., the whole factory having to shut down as a consequence. The necessity for prompt resumption of work, however, lead to very quick rebuilding, and by the second day after the conflagration new buildings were complete and under roof. The entire establishment is again running as usual and the delivery of its product has not been delayed.

National in New Hands in New York.

To distribute National cars in New York City and vicinity, the National Motor Vehicle Co., of Indianapolis, Ind., has appointed the Poertner Motor Car Co., 1876 Broadway, as its Metropolitan representative. The National line has for some time past been handled by the Homan & Schulz Co. The new management provides for the carrying of all National models in stock, as well as a complete stock of National parts.

White Again Declares Allegiance to Steam.

Rumors that the White Company, of Cleveland, O., is to abandon steam for gasolene propulsion in its product reached such strength during the early part of the week, that the company again found it necessary to make its annual showtime denial. Windsor T. White, the president, therefore makes the unequivocal statement that the White output will be more aggressively "steam" than ever before.

Wetzel Convalescent, Visits the Show.

Thomas J. Wetzel, who has for some time been convalescing from typhoid fever, was a visitor at the Garden show during the week. His many friends in the trade were gratified to find him almost completely recovered from his illness.

Pope Entertains Pope-Hartford Agents.

A dinner to Pope-Hartford agents visiting the Garden show was given by President A. L. Pope, of the Pope Mfg. Co., Hartford, Conn., on Monday, the 18th inst. The affair was held at the Engineers' club, New York.

Drake Joins the Continental Staff.

R. R. Drake, formerly of the Diamond Rubber Co., has joined the forces of the Continental Caoutchouc Co. He will assume charge of the adjustments and will have his headquarters in New York City.

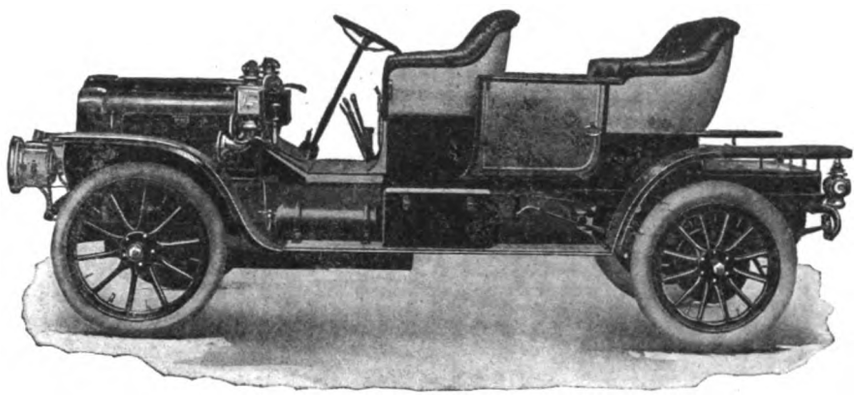
HOLDS APPERSON CLAIM IN DOUBT

Patent on Dual Ignition System Questioned by a Manufacturer—Patentee Says the Courts will Decide.

Following the issuance to Elmer Apperson of his recent patent on the use of dual ignition in automobile engines, manufacturers of motor cars employing two spark plugs for each cylinder have been advised as to the patent situation in this respect and have been invited to enter suitable arrangements for license; but the invitation has in some quarters precipitated considerable heat and an open contention that the patent is not valid, because of alleged anticipation of its claims.

Among the first of such skirmishes, J. B. Bartholomew, president of the Bartholomew Co., Peoria, Ill., has replied to overtures for a license arrangement by denying the validity of the Apperson patent and taking the position that the Canda patent of earlier date, which Apperson purchased preliminary to taking out his own, does not cover the use of separate battery and magneto systems with independent plugs. Bartholomew declares that while the Apperson patent was filed in July, 1906, cars were made at the Bartholomew factory three years before, containing two spark plugs for each cylinder and other elements mentioned in the patent. As to the Canda patent, filed August 26, 1897 and issued January 17, 1899, he maintains that its claims do not relate to the modern system of two complete and independent ignition systems.

When asked by the Motor World concerning Bartholomew's attitude, Apperson, the veteran Kokomo automobile manufacturer, smiled pleasantly and indicated that a prompt and universal acknowledgement of his patent rights could hardly be expected at once, but that where mild measures were unavailing the courts could ultimately decide the conflict. In fact, he suggested, he preferred to do whatever arguing was necessary in the courts rather than elsewhere.



"Before I could get my own patent," he said, "I had to buy the Canda patent. This may show how strong I believe it to be. Nor did I make the purchase without a pretty thorough knowledge of what I was doing. If I am mistaken as to its broadness and strength, I shall learn it from the courts and not elsewhere."

Mezger and National Sales Part Company.

The National Sales Corporation and C. A. Mezger, Inc., of New York City, have terminated the sales arrangement by which the former company handled the latter's products. Differences of opinion as to selling policy and trade relations are assigned as the cause.

Write for the New White Catalog

We have recently issued our complete 1909 catalog. In it are shown the full line of the new Model "M" and Model "O" cars—touring cars, runabouts, town cars, limousines and landaulets.

We have given considerable space to an explanation of the advantages of the White Steamer, as compared with cars of other types, and we believe that this section will prove especially interesting and valuable to those who are contemplating the purchase of any other make of automobile.

The catalog includes a full illustrated description of the construction of the White, with especial attention given to the engine—the simplest used in any automobile, and to the generator—the White steam-making device which is as different from the ordinary boiler as day is from night. You should read this section carefully if for no other reason than that you may be well informed regarding the construction of "The only car of distinctively American design."

A postal to us will bring a copy.

Development of the Ignition System.

What advances have been wrought out in the field of gas engine ignition during the past two or three years is absolutely beyond the comprehension of the non-technical man, and hardly to be appreciated to its full worth by any except those who are fully cognizant of all that is going on in the hard-fought field of ignition appliance production. Indeed the average motorist now looks back with feelings of mingled self-pity and amusement upon the days when he was forced to spend a good portion of his time tinkering, very much in the dark, upon the sparking system of his engine. That his present freedom from difficulties of the sort is due much more to the excellence of the systems now in use than to his own experience and the skill he has acquired in caring for the machine, is not likely to occur to him.

Perhaps the rapid rate at which progress has been made recently as compared with the earlier days of the automobile is due in large measure to the development of the ignition specialist who is a highly theoretical electrician, dwelling deep in realms of megohms and farads. A less obvious and more plausible explanation, however, perhaps may be found in the rivalry which has sprung up between the older favorite in the dry battery and vibrator coil, and the high tension magneto in its many different forms.

With the development of the really successful magneto, great stimulus was given to the improvement of all ignition systems, and in particular to the dry battery and coil aggregation, which it is believed in some quarters it threatens to extirpate. In consequence wonderful strides have been made in coil improvement. In particular the design of vibrators and the relative proportions of condensers to windings has been improved, formulas for the windings have been revised and in consequence the spark coil of the day is a vastly better device than its predecessor of a year or two ago.

In particular, advances have been made in the way of provision for economy of current—a thing which a few years ago would have appeared simply absurd. Now, however, the relative economy of two different coils may prove the deciding factor in a manufacturer's choice of the standard equipment for his season's output, and the coil makers, keenly alive to the fact, are shouldering each other bravely about with the slogan of added battery economy always in the air.

Incidentally this movement has resulted in a pretty general adoption of the idea that a single hot spark is a better and more effective source of ignition than the stream of rapidly succeeding sparks which used to be considered the measure of coil efficacy. In the magneto of the high tension type, the single spark is proving ample for the purpose, and makers of plain coils are not slow to see that with its added benefit of saving the vitality of the batteries, it is a feature well worth developing.

Body Design and Human Anatomy.

With the return of the tide of body design to the styles which have so long been in use among carriage builders, a question very naturally arises as to why the low-backed, diminutive body and seating effects which just now are so much in evidence have attained the degree of popularity which undoubtedly they have. It requires no sort of demonstration to show that the King of Belgium type of body, or the Tulip pattern which succeeded it and immediately preceded the straight line type, are more comfortable and restful to sit in than the smaller accommodations now provided. Whether in the form of the miniature tonneau, the light roadster or the rumble affair—now frequently appearing with the old-fashioned lazyback of the carriage trade—the passenger who essays his first ride after experiencing the luxury of a big tonneau must have certain misgivings as to his bodily welfare during the trip. Oddly enough, however, the result is not usually as bone-wearying as it had been imagined would be the case. All of which points to the suggestive truth that comparatively few people know how to sit down properly when motoring, odd though it may appear.

Long experience in railroad traveling teaches that the highest degree of comfort is to be obtained not when lolling back against the cushions, but when sitting bolt upright, or even leaning a trifle forward. Motorists of long standing have learned to save themselves no small fatigue by the simple expedient of sitting up straight or nearly so, particularly when the car is running at speed or is coursing rough ground. The relief to be obtained in this way is based upon the physiological truth that the nerves which centre about the base of the human spinal column become mortally offended if jarred and pounded as must be the case when the victim leans back far enough to be robbed of the benefit of nature's provision against such a contingency. Indeed long periods of vibratory treatment of this sort sometimes occasion very serious results. Much back-weariness and general debility may be prevented merely by leaning forward.

The advantage of the small tonneau or surrey in this connection is that it offers no sort of temptation to lean back, especially when anything like high speed is being maintained. Indeed to do so, at times involves so sharp a punishment in the shape of a blow from the hard back of the seat, that one such experience is apt to be sufficient. The consequence is that the occupants of the popular machines of the day are learning to assume an alert posture of full muscular control, which not only tends to remove the irritation from the ever watchful nerves, but also enables them the better to protect themselves against sudden jolts and pitchings of the machine. The

Digitized by Google

alluring depths of the more luxurious cars, however comfortable they may be to sit in, do not always prove as comfortable to ride in as the less attractive, straight-backed, thinly padded seat of the roadster models. Their virtue lies not so much in the form of the vehicle, however, as in its service in teaching the passenger how to ride. Once the trick has been learned, it may be that less will be thought of "toy tonneaus" for touring purposes than is now the case, and more of the more luxurious vehicles.

Journalistic Feats of "Ledgerdemain."

In the very nature of things, amazing doings are to be expected on the part of Siamese twins, but that was an uncommonly marvelous brother act, or double sleight of hand performance, that those siamese twins of journalism, The Automobile and The Motor Age, played in their "Special A. L. A. M. Show Issues."It is true that once more the twins both more than doubled their prices, and while it is as true that, as was the case with the Palace show, the function in the Garden was "written up" before the doors were opened, the trifling fact that reporting an event occurring on the 16th in issues bearing date of the 14th entailed an entertaining mixture of present and future tenses, the pretty vari-colored ink used possibly may disguise such phenomenal forehandedness.

But for "twin brothers" to be able to toss into the air the same Raineslaw sort of sandwich and perform such magic as to make it appear two different sandwiches is no ordinary feat, even when performed by siamese twins. On the occasion of their Palace show issues, it seemed fitting to remark the 'twins' sleight of hand performance of slipping here and there a page of reading between twenty or thirty pages of advertising, and thus making a journalistic "sandwich" such as never had been seen before; but we were wholly unprepared for the discovery of the very same "cheese"—the identical reading pages—doing duty in the "special A. L. A. M. show issues" of each of the "twins."

It was a great bit of ledgerdemain (this word is not misspelled) and though overworked sandwiches may not promote digestion, the "twins" have cause to be proud of their double or rather quadruple shuffle, in which pride their half-brothers, the Blue Book and the Directory, surely must share. It is not every year that such an achievement is "pulled off."

MUST PAY FULL IMPORT DUTY

Important Decision Affecting Re-entry of Cars Repaired Abroad—Their Status as Household Effects Denied.

Much interest in the status of American owned foreign automobiles, used abroad by their owners and subjected to foreign repairs prior to reimportation, has been aroused by a decision of the United States Circuit Court of Appeals, handed down January 15, which reverses the judgment of the lower courts and the action of the general appraisers in the case involving the reimportation by W. R. Grace & Co., New York City, of an automobile which had been repaired abroad.

In the case in question it appeared that a foreign automobile had been used abroad for more than one year, but immediately prior to the exportation of the same to this country a new body was placed thereon, and it was maintained by Messrs. Brooks & Brooks, of 12 Broadway, attorneys for the importers, that so much of the automobile as had been used abroad for not less that one year was exempt from duty, and only the limousine body which had been added just prior to the shipment of the car was liable to duty. This contention was sustained by the Board of General Appraisers and by the United States Circuit Court, and when the case came up for argument in the Circuit Court of Appeals last month, the Assistant United States Attorney, D. Frank Lloyd, argued that an automobile cannot be considered within the provisions of the free list relied upon by the importers.

Under the tariff act of 1883 the Supreme Court of the United States held that a carriage was within the corresponding provision allowing free entry as a household effect, but in view of the fact that the paragraph in the act of 1883 referred to did not contain the word "similar," the United States Attorney argued that the provision in the act of 1897 should be limited to household effects of a similar nature to "books, libraries, usual and reasonable furniture."

The decision of the Circuit Court of Appeals says upon this point:

"The insertion of the word 'similar' indicated that Congress intended to do away with the exemption of household effects generally and to restrict it to such as should be like books, libraries or household furniture. We think that automobiles cannot be said to be similar to books, libraries or to usual and reasonable household furniture or either of them."

That the question at issue is to be threshed out further is indicated in a statement made by Frederick W. Brooks, Jr., of counsel for W. R. Grace & Co., who says: "It is our purpose to apply to the Supreme Court of the United States for a writ of certiorari to review the decision of the Circuit Court of Appeals in this case, and if this application is denied we shall bring a new case before the Board of General Appraisers."

COMING EVENTS

January 16-23, New York City—Association of Licensed Automobile Manufacturers' annual show, Madison Square Garden.

January 21-23, Los Angeles, Cal.—Automobile Dealers Association's show.

January 25-30, Cincinnati, O.—Automobile Dealers Association's show.

January 27-February 3, Philadelphia, Pa.—Automobile Trade Association's eighth annual show, Second Regiment armory.

February 6-13, Chicago, Ill.—National Association of Automobile Manufacturers' show, Coliseum and First Regiment Armory.

February 15, Detroit, Mich.—Detroit Automobile Dealers Association's show, Wayne Pavilion.

February 15-20, St. Louis, Mo.—Automobile Manufacturers and Dealers Association's annual show.

February 16-18, Denver, Co.—Denver Motor Club's first annual show, Auditorium.

February 20, 21, 22, New Orleans, La.—New Orleans Automobile Club's Mardi Gras carnival 3 days race meet.

February 20-27, Newark, N. J.—New Jersey Automobile Trade Association's show.

February 22, Cleveland, O.—Cleveland Automobile Dealers Company's show, Central Armory.

February 27-March 3, Hartford, Conn.—Automobile Dealers Association's show.

March 1-6, Buffalo, N. Y.—Buffalo Automobile Club's 7th annual show, Convention Hall.

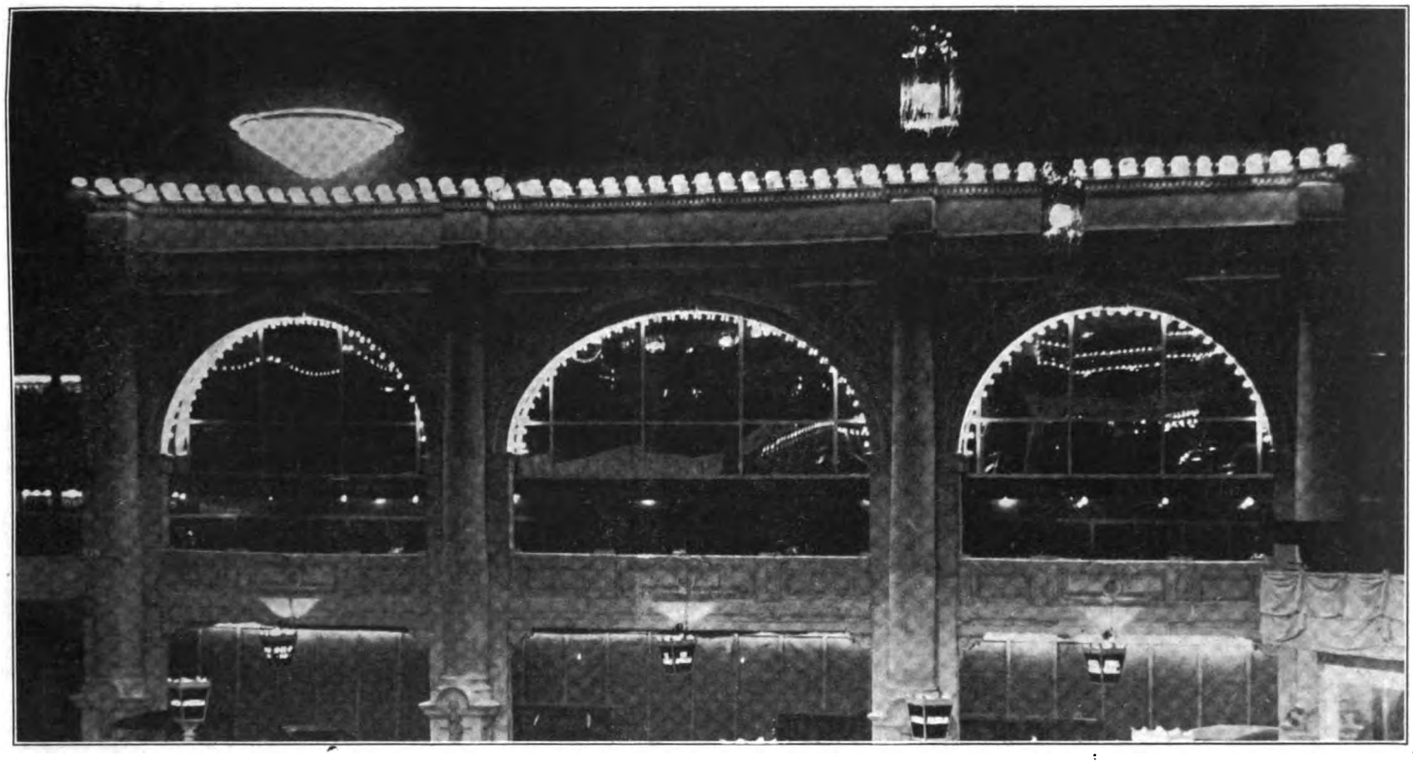
March 1-6, Omaha, Neb.—Omaha and Council Bluffs dealers' show, Auditorium.

March 6-13, Boston, Mass.—Boston Automobile Dealers Association (Inc.) seventh annual show, Mechanics Building.

March 8-15, Kansas City, Mo.—Kansas City Dealers Association's show, Convention Hall.

March 10-13, Memphis, Tenn.—Automobile show, Auditorium building.

March 13-20, Minneapolis, Minn.—Minneapolis Automobile Show Association's show, National Guard Armory.



March 15-20, Rochester, N. Y.—Rochester Automobile Dealers Association's show, Convention Hall.

March 22-25, Ormond-Daytona Beach, Fla.—Daytona Automobile Club's four days speed carnival.

March 27-April 3, Pittsburg, Pa.—Automobile Dealers Association's show, Duquesne Garden.

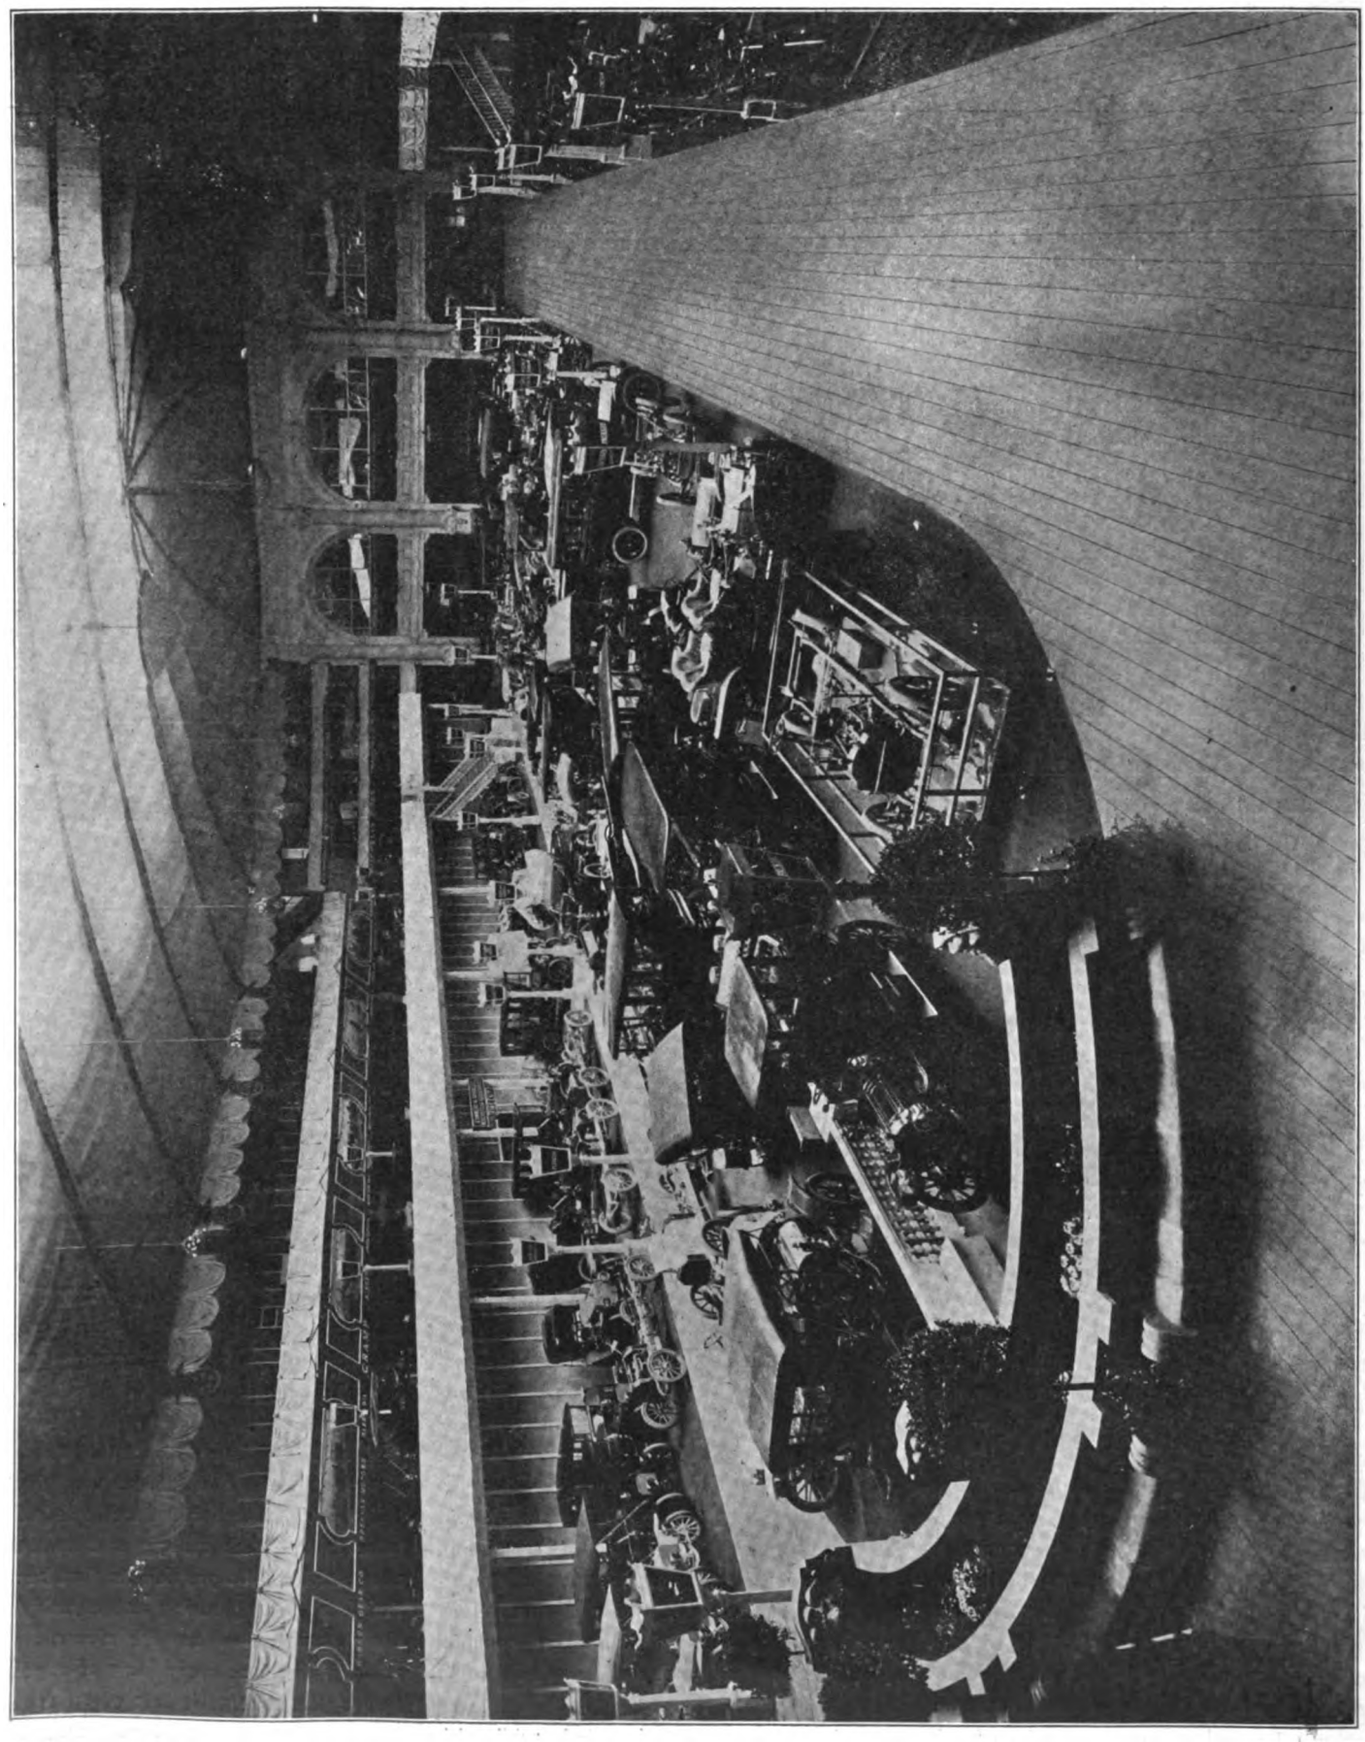
The Garden Show an Active Exposition

TRIUMPHAL ARCH AT THE GARDEN SHOW

Opinions differ as to the supreme beauty of the Garden show. Difference of opinion "is what makes the horse races", and by the same token it is what brings out new decorative effects. Those who are enthusiastic over this year's offering urge that it is beautiful in its simplicity, while others find the simplicity rather severe. Whatever its decorative merits as compared with former shows at the Garden—a comparison which all the veteran show visitors are bound to make—it is, when considered by itself, a spectacle that as a whole is in every way worthy of the industry it represents, the cars themselves presenting an appearance excelling the disclosures of any previous year.



Trees laden with ice crystals, flurrying snow and a wind that makes fur coats seem like mousseline de soie provide a contrast in the transition from outdoors to the interior of the Madison Square Garden that makes the brilliancy and warmth of the show doubly impressive, with its fleet, summer-y runabouts in light colors and the luxurious limousines, and crowds of affluent appearing investigators parading the aisles or chatting amiably in groups, while the music of the band provides an agreeable overtone for the conversational hum. Theatrical looking street lamps at the outer boundaries of the various spaces, bearing in illuminated letters the names of the respective exhibitors lend a very "street-scene-in-Verona" effect which at times gives the visitor the apprehensive feeling of an amateur actor on whom the curtain may go up unexpectedly.

Spaciousness and a freedom from encumbering gew-gaws are apparent when one has passed to the right or left of the electric garden fountain which confronts the entrance. The main floor show spaces have back walls of brown burlaps panelled with white wood strips, and except for the corner lamps and green carpeting are devoid of decoration. No palms, rubber plants, arches or other similar obstructions interrupt the view, so that the cars themselves have every chance to shine out conspicuously in whatever glory of color and finish they may boast.

An immense white "triumphal arch", with the arch intervals bearing three great mirrors, is placed at the far end of the building, the mirror reflections giving an enhanced distance and size effect. The elevated platforms at either side of the concourse or "Circus Maximus", as it has been called, are clear of decorative frippery and so are the upper galleries. In fact about the only effort at ornamentation that has been attempted on the long sides of the main part of the Garden is a series of panels hung from the under part of the second gallery and depicting methods of transportation in different parts of the world, such as the elephants of India, the Eskimo dogs of the Arctic region, and the sea-going hacks of Red Bank, N. J.

Everybody agrees that the concert hall has never before looked as well as it does this year. A huge white trellis is introduced beneath the high ceiling, and concealed incandescent bulbs provide an "indirect" light that is at once pleasing and mystifying. In the restaurant, where the electric pleasure vehicles displace everything of a restaurant nature, the scheme is that of an Italian garden, with mural landscapes, and an overshading pergola. The basement spaces are

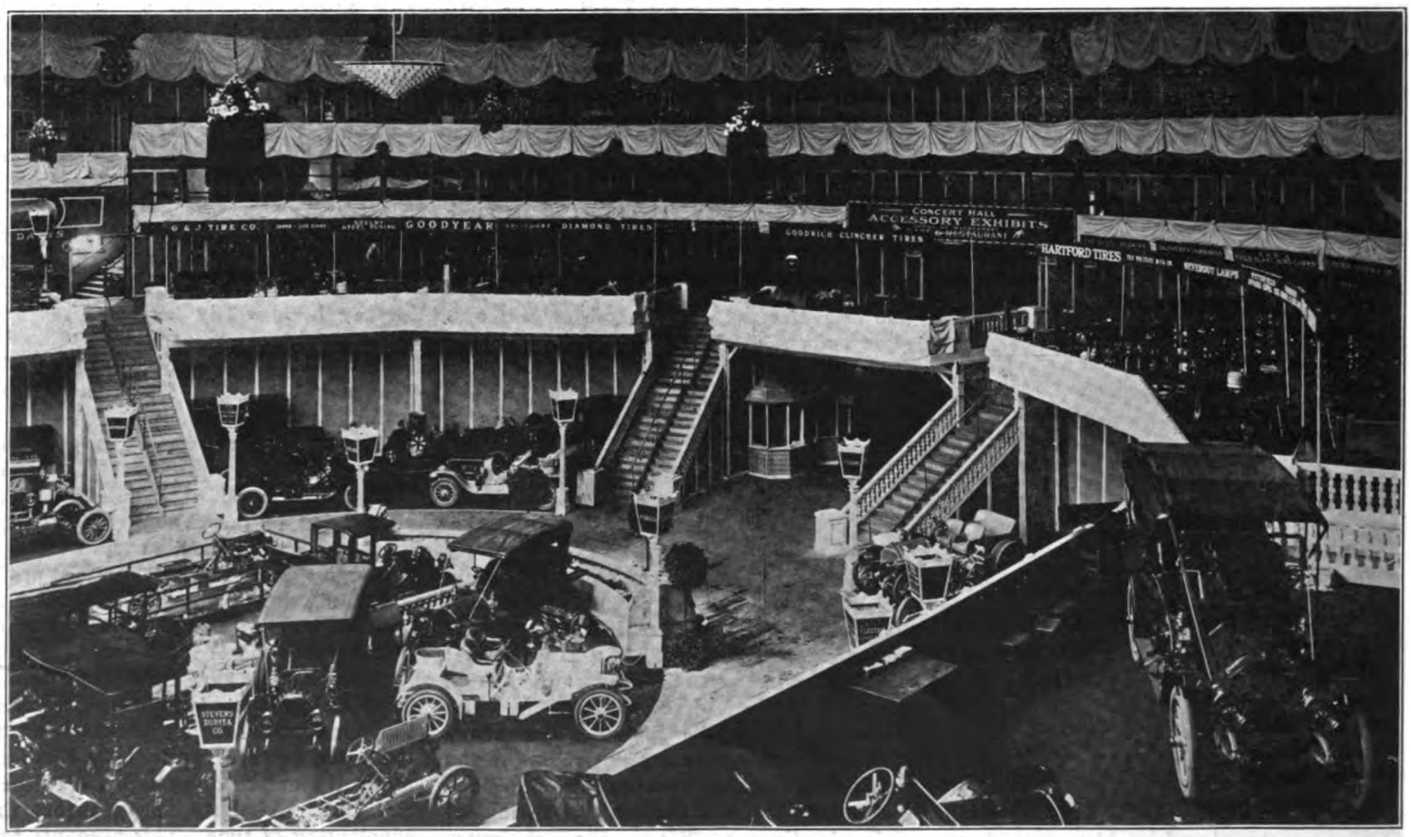
GARDEN SHOW AS SEEN UNDER THE ELECTRIC ILLUMINATION

less ornate, brick wall being only partially concealed by bunting, but the rathskellar is surrounded by a fake stone wall that is very realistic and in its old wine cellar interior the deception is extended to casks, groined arches and Middle Age settings which remove the guest from all thoughts of nearby Broadway.

From the basement clear up to not only the second balcony, but to the little third tier boxes at the ends, where a few accessory exhibitors find perches, there never was a livelier show. If the attendants appear keen for business it is because they are getting business, the number of "live ones" in the ranks, both retail purchasers and dealers, being gratifyingly large.

Movement, revolution, dazzling sparks, thump, clank and buzz are the incidentals to the endeavor of both car and accessory exhibitors to demonstrate convincingly the mechanical points involved in their products. The visitor can change gears and manipulate pedals to his heart's content at practically all of the car exhibits, nearly every one having a show chassis to reveal the mechanical features of the models. A crankshaft mounting fan blades is disclosed at one space, the breeze from an electric fan being sufficient to turn it, while other makers have their chassis connected with electric motors so that the mechanism is given the semblance of real action. Makers of the electric vehicles are fortunate in being able to show their chassis or control arrangements running with power current just as they are used on the cars themselves. The accessory people are the most generous users of noise and motion, however, and a complete trip past their spaces has all the surprises and excitement that ingenuity of display and presentation can invent. Then there is the motorcycle section, where the machines of this class hold forth in numbers that prove astounding to those who have not followed the development of the motorcycle movement.

Except for the one make of steam car and the electric vehicles, all of the cars shown are made by members of the Association of Licensed Automobile Manufacturers. Most people even casually interested in motoring have come to know that the members of the Licensed Association operate under the Selden patent, claimed to cover the elements of all gasolene cars. Since 1906, when the Association took control of the Madison Square Garden so far as automobile shows are concerned, only "licensed" gasolene cars have been exhibited at the Garden affairs, but it was as far back as 1900 that the building held the first of its annual automobile exhibitions so that the present one is described as "The Ninth National Automobile Show." The heavy burden of making the arrangements for and conducting the show rests on the show committee of the Association, consisting of Colonel George Pope, the chairman, Charles Clifton, president of the Association; Edward P. Chalfant, general manager of the Association, and the committee's secretary, Merle L. Downs. The results of months of their work is crowded within the narrow limits from Saturday, the 16th inst., when the show opened, to Saturday, the 23d inst., when it closes.



It is by no means a sensational show, in respect to suddenly revealed surprises in either design or price, such as have been "sprung" at show time by manufacturers in the past. Marvelous as are some of the new offerings in both these features, they have already been widely heralded, so that the public has been prepared for them in advance and finds the show an opportunity to confirm the truth of the earlier announcements.

Great range and variety is presented in styles and prices, and probably never before have the "licensed" makers had such a representation in the field of "popular price" machines and medium powered cars, although the extremely low priced products, in an absolute sense without relation to quality, are not many. The development of the new models in the medium powers, by makers who have heretofore been identified chiefly with high powered machines has not resulted in any lessened loyalty to the latter, however, so that the smaller cars are in the nature of an addition to the general character of the output rather than a supplanting of type. This accounts for the fact that in the higher prices the offerings

VIEW SHOWING ELECTRIC FOUNTAIN AND PANEL FEATURES IN DECORATIVE SCHEME

VIEW SHOWING ENTRANCE TO "CIRCUS MAXIMUS" AND APPROACH TO CONCERT HALL

Digitized by Google

are as numerous as in the past and that some of them embody a degree of luxury and expensive detail that puts them among the most altitudinously listed motor vehicles ever placed on the American market for regular sale.

Trade observers looking for any possible change in the public attitude toward the shows have for the second time this season been disappointed, as the attendance of the public is just as enthusiastic and general as at previous events of the same kind. Increase of dealers' attendance is apparent, moreover, indicating that at the present time the big automobile shows enjoy a blending of public and trade patronage that is highly advantageous.

From the West, including points all along the Pacific Coast, a remarkably strong delegation of tradesmen have arrived on the scene, while dealers from Canada, Mexico, and Cuba appear in numbers that suggest how important the trade lying the other side of the northern and southern boundaries of the United States is becoming. Such visitors mean much to both car and accessories exhibitors.

While on serious business bent, the trade visitors are quite as much delighted and entertained by the lighter phases of the show as anyone else. They like to look at the many beautiful prize cups that are this year displayed by the manufacturers whose cars captured them. The Vanderbilt cup, famous the world over as a racing trophy, is exhibited by the Locomobile Co. of America, a special officer standing guard over it all the time in the space where its winner, the Locomobile, and the "New York-to-Paris" Thomas car are on view. As a gentle bit of "crowing," the Locomobile cars in the company's nearby space, all have a miniature Vanderbilt cup affixed to the top of the radiator cap, and so firmly fixed that souvenir hunters cannot pull them off.

Bathed at times in the purple, green or deep blue beams of the playful electric searchlights that point downward from the topmast galleries, the evening crowds are in themselves a colorful exhibit by reason of the presence of so many women, whose spangled and elaborate gowns give a generous chromatic contribution to the scene. Furthermore, the wearers know more about cars than do the salesmen in some instances, and he who would seek to obtain the order for the town car or limousine which they purpose buying must needs be well equipped with both technical knowledge and selling ability.

NOVELTY IN NEW DESIGNS.

Next to the impression of the show as a whole and with the beginning of the ab sorption of its minor details, the visitor comes to a realization that whatever may be the structural tendencies in the power plants of the vehicles, body design and in particular body coloring has taken on most alluring shapes and tints for the purposes of the show. Indeed, the setting of the Garden this year permits the color effects on the various bodies to be appreciated as never before, while the effect also is considerably enhanced by the fact that a number of the makers have chosen the most daring and brilliant shades for their exhibition vehicles, in some cases very evidently choosing the color schemes of the machines on view with the distinct purpose of bringing about effects which are either bold or harmonious according to their individual fancy. Thus certain displays stand out in bold relief by the very glitter of their elements, thereby concentrating the attention at once upon the cars instead of upon the show as a whole, as sometimes is the case where the decorations are selected with an eye to dazzling the visitor upon entering the show and permitting him no opportunity for recovery while within its precincts.

The tendency—if tendency there be in the general run of body design just now—is toward the development of the miniature tonneau effects, with their complementary shapes in the double rumble roadsters. These and the touring cars, which naturally remain the principal stock in trade of the makers, reveal ample evidences of improvement in detailed construction and finish, but seldom any of the drift toward undue lavishness in equipment which used to be manifest. Even the limousine bodies are frequently found to have taken on a soberer tone within the year, though noteworthy exceptions are to be found in one or two instances of vehicles which are distinctly showy in their nature and which are rendered all the more conspicuous by that very fact.

Of these, perhaps the most striking is the suburban body which is displayed on the Pierce stand and which is finished most daintily in Louis Seize style, with narrow gilded mouldings and fittings, the delicate pink and white effect of the upholstery in clean contrast to the green body color, which is set off by the brass work. Even this is of special art design, the side lamps, for example, instead of being in the ordinary lantern form, being shaped as candelabra with filaments concealed inside the glass flames of the torches.

More striking exteriors are those displayed by such cars as the little Palmer & Singer town car landaulet with its deep orange tone, its neighboring Skimabout in green, the Franklin "six" in automobile red of characteristic hue set off by broad vertical black stripings, the Studebaker Suburban with its natural wood box and gear and basket seats, or the Winton display with its cerise body trimmed in aluminum colored leather and its sister car in bright green tint. These are rather the exceptions than the rule, however, the majority of the cars being dressed in colors which though striking enough in any other connection are relatively modest in a show of automobiles.

But for the wise visitors, who, having regard of the adage about the depth of penetration of the layer of beauty, the show is a place full of wonders in mechanism refined and standardized to a degree which it never would have been thought could become so general, especially when, only a year or two ago, the vestiges of the old regime yet re-

At the last A. L. A. M. show in Madison Square Garden, November 2, 1907, a total of 241 vehicles was exhibited, of which 124 were gasolene pleasure cars, 4 steam cars, 38 pleasure electrics, 53 motorcycles, 10 gasolene commercial and 12 electric commercial. In addition to these there were 30 pleasure chassis and 2 commercial chassis.

Digitized by Google

mained, when every builder followed a path different from that of any other.

There is, for example, the growing agreement in the use of the high tension magneto, the interesting variation in practice between the use of the complete dual system with two sets of plugs, and the single system with optional sources of current, in magneto and battery, together with the methods of wiring, the mounting of the ignition apparatus and the varied individual devices for improving its convenience or action; there are the variations in the method of cylinder casting yet apparent in single, double, triple and quadruple units, the various arrangements of the engine auxiliaries as well as the valves, ports piping and gears; and last, but not least, there are the variations in the arrangement of the transmission, disc, cone and plate clutches, sliding and progressive gearsets as well as planetary, unit power plant mountings, and the increasingly popular axle units.

Despite the onward march of standardization, each manufacturer has managed to retain a certain distinctiveness for his product. Outwardly this is manifest first in the characteristics which are significant to the mechanically inclined who are thoroughly familiar with the earmarks of the industry. Also it is increasingly manifest to all in sundry special marks which are being adopted as brands upon the different makes of machine. Usually either on the radiator front or the hub cap some special design or emblem is found which serves to distinguish the car from all others, and the showgoer who is inclined to a display of wisdom at a later period in the year, usually takes this occasion of familiarizing himself with such hall marks.

It is no use looking for the sort of radical departures which a year or two ago furnished the spice of show visiting. They are no longer to be found. Instead the well-informed investigator is content to look for less conspicuous though none the less important alterations in the methods of accomplishing certain ends which are common to nearly all machines, as in the arrangement of the mechanism of control, the arrangement of the timing and auxiliary driving gears of the motor, the arrangements for relieving the driving stresses in axles and transmission shafts and even in the placing of the attachments which formerly ornamented the dash board but which, by every possible artifice are now concealed or entirely effaced.

Except in the lines thus vaguely indicated, the discovery of mechanical landslides in any particular direction is practically impossible. It is only by a direct examination of the individual exhibits that the visitor is enabled to arrive at any conclusions as to the wealth of novelty which the show actually possesses, and only by a tour of the show from exhibit to exhibit is the chronicler able to convey even a passing hint of the possibilities for study and appreciation which it presents to the visitor.

Changes in factory organization or business organization in several instances have given rise to rather important alterations in the product. An instance of this is to be found in the case of the Walter cars—the Roebling-Planche product as it is to be known henceforth—in which the Walter models of last year have undergone a number of alterations, notably in the redesign of the springs and rear axles; while added refinements have appeared in a neat trunnion mounting for the radiator, the use of a carburetter fitted with automatic ball valves for controlling the auxiliary air supply, and the details of the single piece crank case casting with its three-point suspension. Touring car and taximeter cab forms are shown, the latter distinguishable by its unusually low hood, while the most conspicuous feature of the display is the brand new racing model of 100 horsepower rated output, which is of entirely different design from the touring cars, built exclusively for speed purposes, and carries a number of features which are particularly appropriate to its class.

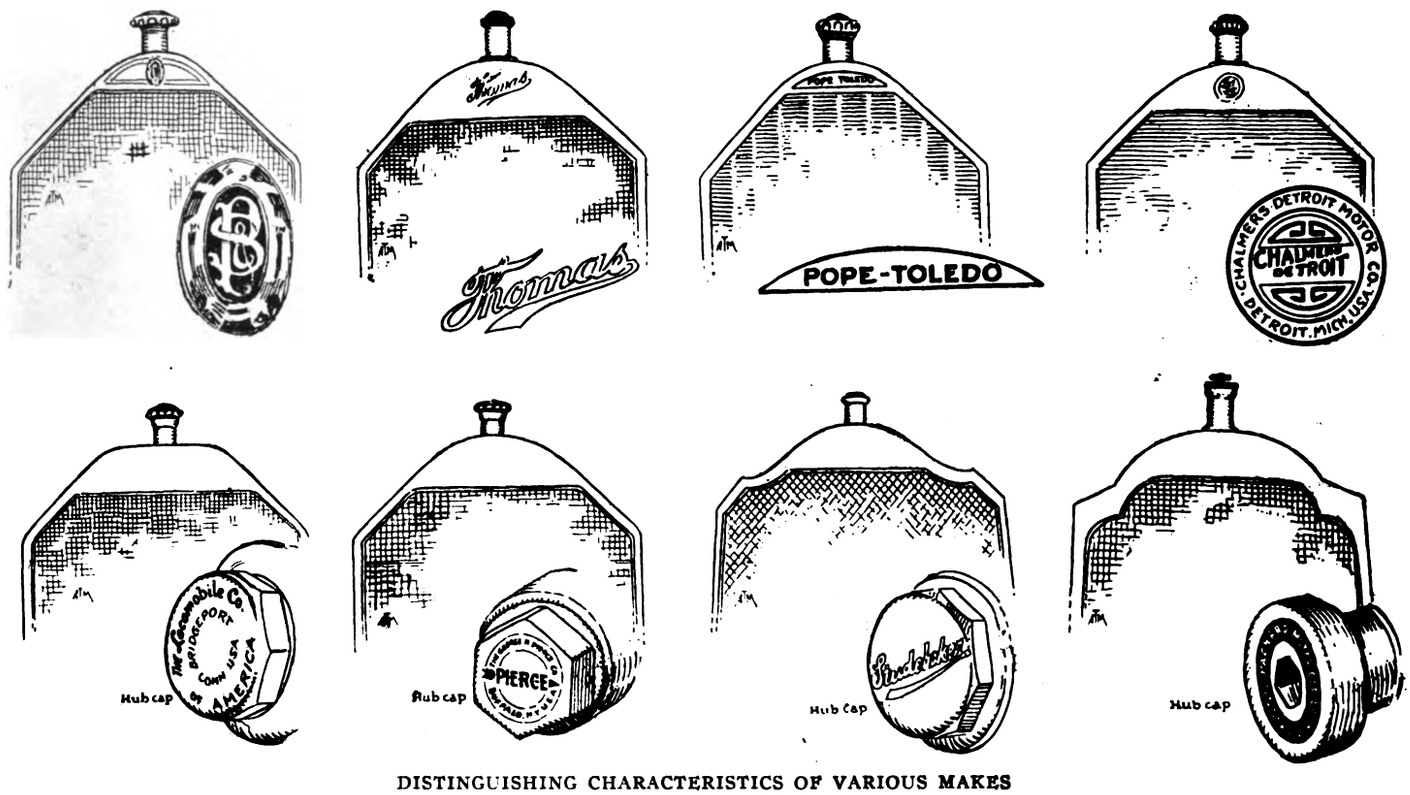
DISTINGUISHING CHARACTERISTICS OF VARIOUS MAKES

The Chalmers-Detroit, which has not been exhibited at the Garden before and is still in the first blush of its youth on the market, appears in a form which attracts considerable attention both from the fact of its structural features and because it is shown in sectional chassis, with electric motor drive. The motor is provided with unusually large inlet valves mounted in the heads and actuated by rocker arm offset exhausts, and a particularly neat arrangement of the piping. The combined housing and support for the multiple disc clutch and selective change gear is supported from the engine casing, and also absorbs the full torque load, the torsion stresses being taken up by the familiar tubular housing which is supported by the casing through a ball joint. An original feature of the assemblage is the provision of a yoke depending from the cross frame member just back of the gear case, which is calculated to keep the torque tube and shaft from dropping or thrashing about in the remote event of a failure of the joint.

Another of the absolute newcomers at

Digitized by Google

the show is the E-M-F "30", which is a wonderfully trim little offering at a little price, but full of big possibilities. From the standpoint of design it is no less to be wondered at than in point of its market possibilities. It possesses the axle-mounted type of change gear which is counted so high by many designers, expanding ring clutch, and a torque provision which is unique in that the resisting lever is stamped from sheet steel—like the ends of the axle casing. The motor has several peculiarities, among them the use of 2⅛-inch valves for a 4-inch bore, offset crank shaft, thermo-syphon cooling and splash lubrication automatically fed from a large reservoir cast integrally with the crank case. Very unusual is the construction of the steering knuckles which are offset back of the pivot points to secure the so-called castor-effect, or trailing action thought to be useful in steadying the action of the wheels and rendering guidance easier than with the ordinary central pivot system.



The Studebaker line, which is associated with the last named car on the market, is this year distinguished by the use of the new Bosch magnetic plugs with low tension magneto. The arrangement permits the effect of the ordinary make and break spark without the mechanical complications which the mechanical make and break carries with it, and also with all the certainty and positiveness of the electrical device. In other respects the car remains practically as it stood a year ago, except that the steering post has been reinforced, a new type of automatic air valve has been added to the carburetter and one or two other minor alterations have been made which are not of material significance. The chassis is of particularly impressive design by reason of its evident thoroughness of detail, and the body mountings which it carries on the stand are built along thoroughly rational lines, particularly the suburban type, which has the box body of the despised farmers' democrat wagon, with adjustable rear seat which may be removed to make way for such luggage or other material as the suburban dweller may have occasion to transport.

A number of the better known makers have brought out new models this year which are here shown for the first time, among such cars being the Lozier, which is shown in a new light six cylinder type, which has its motor valves mounted entirely on the left side, instead of on both sides, as in the older and larger models, and a massive torque tube leading from a brass ball and slip joint supported just back of the gearset to the floating type rear axle. The Winton six-cylinder type also is seen in new form in a 48 horsepower machine, which on the stand is distinguishable by a marvelous arrangement of intake piping made necessary by the location of the carburetter on the opposite side of the motor from the intake ports and also by the arrangement of the exhaust manifold. Self-starting by means of compressed air run through a special distributing valve is an original feature of this particular line, which is carried over into its second year with great pride.

The Packard line is this year distinguished by the first deviation from the policy of one-design, one-car construction which has been retained for several years. In addition to the redoubtable "30" type there now is a so-called "18", designed primarily for twin car work, but following closely the lines of its larger sister car. Knox cars, formerly distinguished among the limited number of exponents of air-cooling, are now shown for the first time in all-water-cooled form, the motor of last year with its removable cylinder heads, being supplemented by a newer form of smaller size and of more conventional design, though still embodied in the characteristic unit power plant. Another line displaying new developments is the Autocar, which in addition to the new commercial chassis, shown in the arena by virtue of its adaptability to town car and pleasure bus service, is supplemented by a four-cylinder model, in which a peculiar feature is the method of housing the rocker arms which actuate the inlet valves in the cylinder heads—the arrangement being suggestive of that employed in certain types of make-and-break ignition.

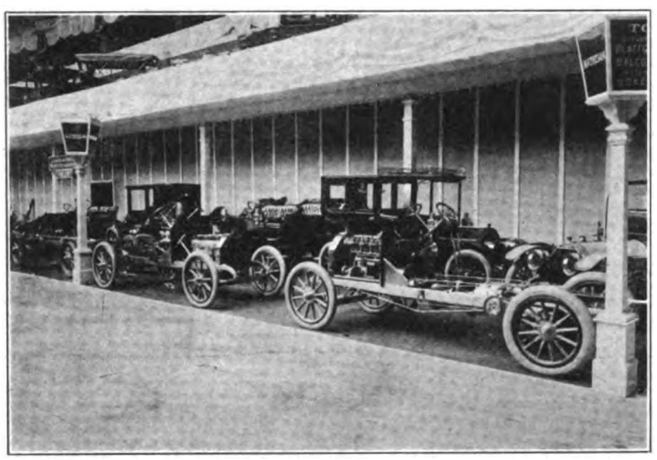
The Elmore cars—staunch and tried exponents of the two-cycle principle—are featured at present with sundry minor improvements and one or two of general interest to the casual visitor, as in the case of the enclosed cone clutch, which now has the actuating spring mounted directly behind the cone. An offset crank shaft, newly designed steering column, lower front axle, and reinforcement of the brakes are other alterations which have been made to this single A. L. A. M. two-cycle product.

Among the new models by makers of long standing, which are cited as worthy

DISTINGUISHING CHARACTERISTICS OF VARIOUS MAKES

Digitized by Google

examples of the movement for higher quality at lower price is the new Cadillac Thirty, which embodies a number of distinctly original features which are new in addition to several others which have been employed in other vehicles of the type. Among the latter group may be mentioned the use of individual copper water jackets, and the design of the carburetter. The rear axle assemblage is rather unusual in appearance due to the fact that the rocker shafts actuating the brakes are brought inward almost to the center of the chassis, affording means of securing an equalization of the pull by means of very short lever arms—an apparent improvement over the method of extending such members for the full width of the chassis. A newly designed universal joint which is completely enclosed in a metallic housing is another feature which is noteworthy. Also it should be mentioned that the little single cylinder machine which has done yeoman service for so long is still produced and in practically the same form as when first turned out.



The Electric Vehicle Co., which through astute management has retained its position in the manufacturing field despite its heavy financial setback, is represented in several examples of the "Mark 48-3" car, which has been continued over through four seasons with only minor changes. A point which the critical observer is sure to note in its construction, is the arrangement for absorbing the torque of the axle and the driving strains in the rear assemblage. Instead of the usual torque system, the driving shaft with its two universal joints is left entirely clear and exposed, not even the double-cross joints being housed, while at either end of the axle two short arms are raised outside the frame sills, combined radius, torque and driving rods connecting their upper ends with the frame, at a point adjacent to the front anchorage of the rear springs. Sundry alterations in the arrangement of parts, such as the use of wider faced gears in the two-to-one group, annular ball bearings supporting the pump, magneto and cam shafts at their forward ends, have been made, and the frame size has been standardized so that the same construction now is used regardless of body mounting, the idea of interchangeability thus being promoted.

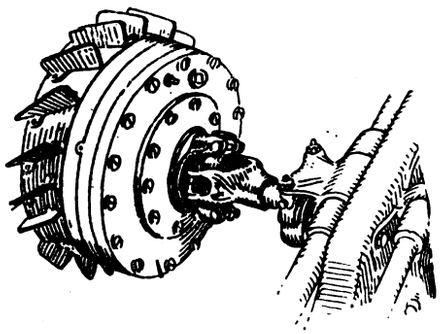
One of the newcomers at the show and also a car shown in New York for the first time on any such occasion, though produced within the city limits, a number of interesting points are displayed in the construction of the Palmer-Singer cars, which are shown under the license of the Hewitt Motor Co., by whom they are produced. Palmer-Singer, as distributors for the Simplex cars, also have an interest in the adjoining booth. On the Skimabout, the smaller of the Palmer-Singer models shown, the use of the double drop frame, permits a very low entrance to the town car, and an exceptionally low-hung and handy type of vehicle for city use is thereby developed. In runabout form, the chassis is hardly less pleasing, as the design employed is one of particularly graceful dimensions.

Aside from its more recent distinction as the family from which sprung the winner of the 1908 Vanderbilt cup contest, interest in the Locomobile exhibit is keen from the fact that in the new 30 horsepower type displayed, is shown the first attempt of the Locomobile designing department to produce a shaft driven car. The use of high grade metals in this machine has made possible the employment of a particularly light and pleasing axle formation, with its torque rod, spring supported at the forward end, and its enclosed cross form of universal joint. Special construction all the way through is claimed for the axle, and the details of its mounting are illustrated in a sectioned model displayed at the stand. Except for this feature, the machine follows many of the lines which have characterized its predecessors of the same name, among them being the use of low tension ignition with mechanical make and break igniters. In the axle assembly the use of radius rods is found which besides relieving the torque member and springs of any traction load, also serve as supports for the brake anchors, and being swivelled on the axle, any possible interchange of stresses between the springs and rods is avoided, and the function of each group is kept entirely independent.

The latest product of the Selden Motor Vehicle Co., is built with standard frame sizes for all types of body, including touring, roadster and limousine types, so that all three are interchangeable. In general arrangements of parts it is not out of the ordinary, but a number of original details are found in the method of working out some of the minor problems of its design, such, for instance, as the engine lubricating system. By the aid of a gear pump driven from the commutator shaft, a constant flow of oil is maintained, while the overflow from all the bearings, returning to the crank case is subsequently permitted to drain back into the pump well, which is in a separate compartment in the lower portion of the base, from which it is later drawn up for re-circulation.

In the 1909 Haynes cars, a novel feature is found in the manner of utilizing the space in the motor supporting arms, which ordinarily goes to waste, for the completion of the lubricating system. The forward arm on the right side of the machine, in fact, is really a multiple feed pressure actuated oiler, its location being such that not only is the containing chamber freed from danger of injury, but it is thoroughly accessible and handily located with regard to the possible requirement of making occasional alterations in its adjustment. Another feature of the latest model, is the provision for cooling the brake drums by partially filling them with water, which is retained by large flanges turned inward from the inner edge of the drums. The details of the roller pinion drive and the unique vertical torque bar which is confined to a vertical movement by sliding up and down in a yoke fixed to the chassis as the axle and springs alter their relative positions are noteworthy. This arrangement has displaced the former device which was similar in principle but necessitated the sliding of a much longer ver-

MATHESON EXHIBIT

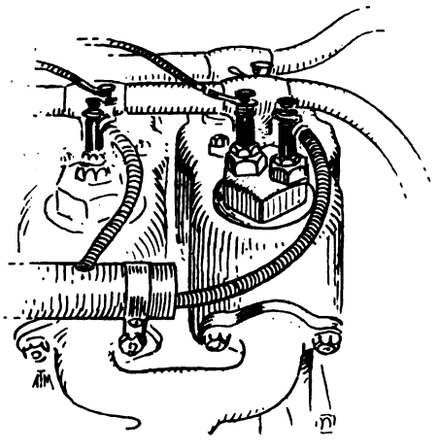


FRANKLIN EXHIBIT

Digitized by Google

tical arm up into a recess in the lower side of the body. Numerous other original features are displayed in this machine, among them being the clutch construction, the use of a ratchet drive for the lay-shaft gear and the provision against the stripping of gear teeth thus brought about.

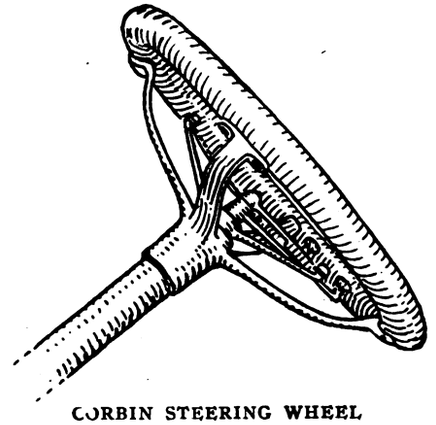
Franklin cars are shown in several different styles, but the unique features which they embody are illustrated in no better way than by the sectional motor mounted on the stand, which shows not simply the general arrangement of parts, but also the manner in which the independent cooling flanges are slipped over the cylinder castings, the arrangement of the concentric inlet and supplementary exhaust valves, and the location of the mechanically operated main exhausts at the sides of the cylinders, and just at the lower end of the working strokes of the pistons. A novel point in the 1909 models of the line is the exclusive employment of magneto ignition of the high tension variety without the use of batteries as a standby, and also with a fixed spark



THOMAS CLUTCH

advance. The engine is now carried on angle steel cross rails instead of cast webs, the valve action has been improved by the use of a new system of cam generation and a new method of oil distribution in the cylinders by means of baffle plates has been adopted.

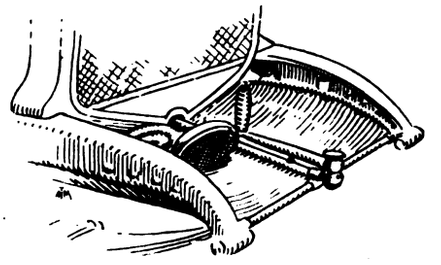
Another of the new sixes is the Thomas, which is remarkable in that the cylinder groups are cast in triple units instead of in pairs; as in several less conspicuous details. The general arrangement of the transmission mechanism on this vehicle is that of the Thomas car and taximeter cab chassis which has been so successful, though its dimensions and minor details are worked out on a different and appropriate scale. It differs from the little car, however, in point of clutch construction—the three plate type which has so long been a feature of the line being retained in place of the multiple disc used on the commercial type. It is this year completely enclosed. Its connection to the bevel pair on the axle is unique in that the shaft is equipped with two universal joints and is permitted to move independently of the tube which encloses it.



Apperson cars, which are produced in a variety of models, are shown to advantage in both four and six cylinder types—the latter being a newcomer, relatively speaking and embodying several minor departures from previous practice. In view of the recent announcement of the Apperson control of patents alleged to be basic as covering complete dual ignition systems, it is in-

APPERSON SPARK PLUG MOUNTING

teresting to note the way in which the principle is worked out on these machines. The observer will be interested to note the manner of mounting the high tension magnetos and the wiring arrangements, but also the way in which in order to secure an equally good firing position for both sets of plugs they are mounted in pairs in the valve caps. Somewhat the same arrangement, by the way, though differing in detail, is found on one other six cylinder car at the show.



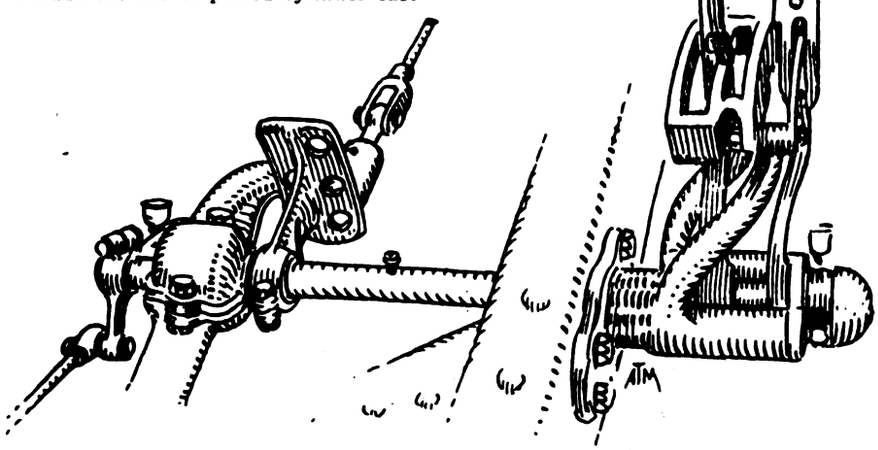
Along with the redesign of bodies, the adoption of a new type of steering wheel which is dished to prevent interference with the motor controlling levers when negotiating sharp corners, the improvements to the Corbin line include a rearangement of the engine lubricating system such that the cam shaft gears are better provided for while their housing also has been improved; a redesign of the clutch-operating mechan-

CORBIN STEERING WHEEL

ism such that the leverage over the clutch itself is greatly increased. A similar alteration in the connection for the foot brake pedal has resulted in giving it more retarding effect with less effort. Another point of deviation from former practice is in the construction of the propeller shaft which is of new design, with a special type of universal joint, fully enclosed.

In the Royal Model "M," which is practically a new car, produced by a new company, though carrying many of the original features of its immediate predecessor, are to be found a number of original points which are particularly novel. Among them is the forward extension of the frame sills for a considerable distance in front of the radiator, and the enclosure of the space thus formed by a protecting steel pan, which tends to exclude the road dust from the radiator. The presence of the pan also is utilized by the designer in affording position for the horn, the tube for which is led through the interior of the chassis and up the center of the steering column to the bulb, which is mounted above the hand wheel, while the motor starting crank instead of being left dangling or caught up with a strap, is hinged so as to fold back and lie in the pan when not in use. Another unique features is the method of connecting the ignition leads with the spark plugs by means of a large rectangular brass leader which encloses the wiring for both battery and magnetic circuits, the terminals

ROYAL DUST PAN

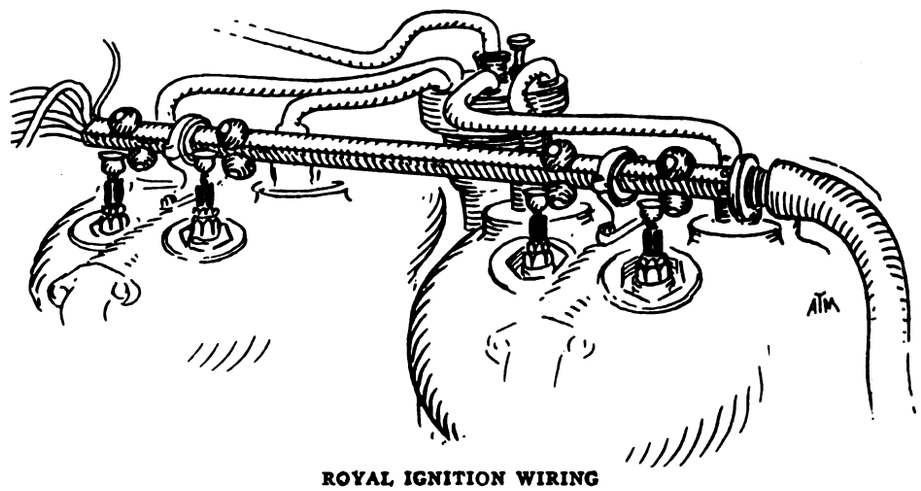


being connected with studs which project through to the outside. The conductor being capable of rotation, it follows that altering its position will serve to bring one or the other of the two sets of studs into contact with the special caps which top the spark plugs, thereby closing either secondary circuit as may be required. Leaving it in the neutral position, of course, cuts off all current. The car is fitted with a self-starting system in which air, compressed by a small pump located in the waist of the chassis and driven from the transmission shaft is used expansively in the cylinders, as selected by a special form of commutator or distributing valve mounted on a vertical shaft between the two pairs of cylinders.

As being the only steam car exhibited, as well as representing one of the very few exceptions at the show to membership in the A. L .A. M., the White is a particularly noteworthy display. This year for the first time, the new 20 horsepower model is on view, not simply in the form of the complete vehicle, but as a stripped chassis, whereby the passerby is given a unusual opportunity of studying the details of White construction to his heart's content, the particular show chassis on view being especially well suited to a demonstration of the wonderful developments which have

Digitized by Google

taken place in this particular line since the early days of the teakettle boiler and the non-condensing engine. The generator, which resembles nothing quite so much as a twisted mass of useless tubing, together with its regulating devices for both fuel and water, is much the same is has been in use for several years, though it has been subject to the usual yearly improvement in small details. The engine on the other hand, is of new design, and embodies the Joy type of valve gear which is largely employed for locomotives in British railroad practice and possesses a number of advantages which the plain link motion never can hope to attain.



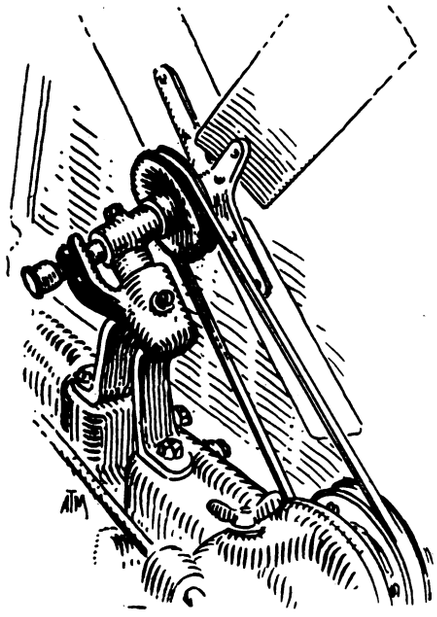
Quite the most significant alteration in the design of the Pierce line, and one which is conspicuous in these cars is the adoption of the side lever control for the change gear in place of the short lever mounted on the steering column, which was used for so long. The selective arrangement adopted is provided with a substantial inter-locking contrivance in the form of a perforated segment into which a finger actuated by the clutch mechanism is pushed when the clutch is seated, the holes drilled in the segment for the purpose being so arranged that one of them always will register with the finger regardless of the position of the gear lever. Two new models, one of four and the other of six cylinder construction comprise the complete vehicles which have been added to the line, though in many respects they represent no significant alteration over previous practice except as increasing the scope of the product. Alterations in engine design include the use of paired cylinder castings, rollers for the cam contacts, and a fibre end thrust bearing at the forward end of the crankshaft.

PIERCE CHANGE GEAR CONTROL

In the Stevens-Duryea cars, the construction of the unit power plant, which in itself is an original feature, is of considerable interest by way of comparison with other unit plants, in that a very long reach between supports is obtained, which in the case of the six cylinder models is readily remarked. The three-point suspension principle is here carried out logically, the forward bearings being on opposite sides of the frame, while at the rear the gear casing is carried on a single hinged joint. Perfect freedom of the plant from any distorsion of the frame is thus provided for, and the success of the system is attested by the fact that it has not been changed since first adopted as a pioneer invention in its class. Progressive gear shift, with a self-finding device to prevent over-running the notches are features common to all models, as is the use of a multiple disc clutch consisting of all steel members, one set of which are faced with asbestos fiber, and in which no oil is used. The new 24 horsepower four cylinder model, embodies practically all the standard features of the remaining older members of the line, both in the larger and smaller six cylinder models.

In sharp contrast to the theory of the triple point suspension as applied to the unit power plant, is the idea carried out in the design of the new Matheson cars—the latest model of which appears at the show practically unheralded—wherein the engine base is flanged outwardly to the sides of the frame and in the form of heavy webs which are intended not alone to support the motor, but also to stiffen the frame and absolutely to prevent weaving or vibration. Unlike the larger four cylinder model, the cam shaft is carried in the base, while the actuation of the overhead valves is accomplished by means of tappets and push rods.

ROYAL IGNITION WIRING



The clutch is of the multiple disc type, as in the larger car, but the transmission other than that is totally different, being of the popular axle-mounted type, but of original design, with a bronze housing for the differential and sliding gear groups. The torque tube is of heavy construction and is given a universal mounting well forward in the frame.

The Stearns line for 1909 is signalized by the adoption of both shaft and chain drive for the larger model which has been the standard up to this time, the two arrangements being optional with the vehicle unchanged in other respects. An even more significant innovation, however, is in the development of the new town car type, which has all the ear marks of its class, together with one or two entirely original and altogether promising features. Thus, the motor is of the block type, the heads and ends of the casting being liberally cored, while the cover plates applied to the heads and the front end are utilized for making the water connections. A unique feature of the unit is in the arrangement of the bed casting, which is cored to form the chamber for the centrifugal water pump, the intake for which, coming from beneath the radiator, is cored through the bed casting. The radiator saddle also forms the front cover for the two-to-one group, and the entire arrangement is at once compact and practical looking. In the rear axle, however, the most unusual feature of the vehicle is to be found. Here the differential housing and change gear casing is secured to a trapezoidal framework which forms the axle proper, the latter being extended at the ends into the regular tubular form, but at the center taking the form of an open frame

Digitized by Google

of practically diamond shape, which is tremendously strong in appearance, considering the probable weight of the car. The traction and torsional stresses are absorbed through the medium of the usual tubular housing for the propeller shaft.

In the matter of torque resisting mechanisms, perhaps the most unusual arrangement to be seen is that of the Pope-Hartford Model "S," which has been thoroughly overhauled since last season, but still presents many of its former characteristics. In

POPE-HARTFORD BELT TENSION

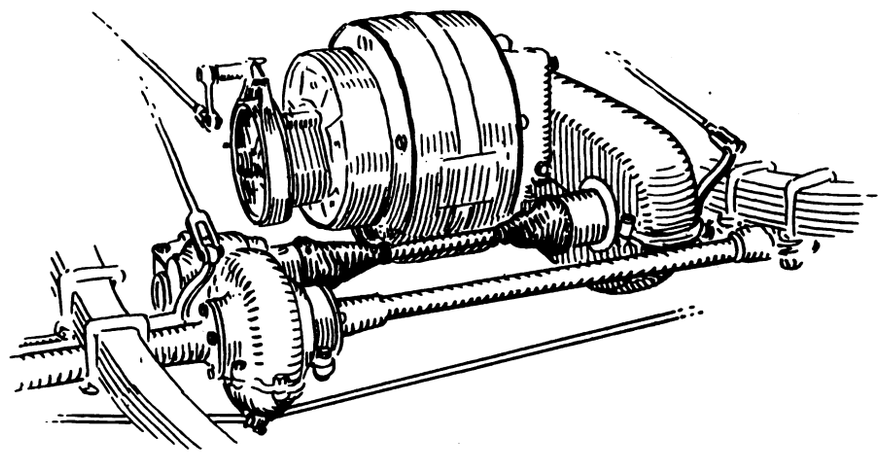
this, the use of torque resisting tube and bar effects has been entirely eliminated, and in their place a single connecting push link has been substituted, which extends from the lower side of the differential housing on the rear axle to the lower side of the frame member which supports the gear box. By virtue of its offset with relation to the axle center, this bar acts in opposition to the torsion, while the same position also affords it ample advantage as a driving member for the traction resistance. The motor has been increased in power by a rearrangement of its auxiliaries and sundry minor changes in design, the clutch is of wider face and larger diameter and has been redesigned, the brakes have been enlarged, and the frame has been modified to some extent, gooseneck spring hangers with long rear extensions now being one of its features.

In the Pope-Toledo, now made by the Toledo Motor Co., a new organization which has recently taken over the business of the Pope Motor Car Co., is to be found what is practically a reproduction of the massive, luxurious car of last year, but with a few improvements which are calculated to increase its efficiency in certain respects. Thus, in the design of the crank case, alterations have been made so that the lubrication of the two-to-one gears is now accomplished by means of the regular oiling system, the supply being pumped directly to the gears and the shaft bearings, all overflow being returned to the pump well.

VARIETY IN ELECTRIC VEHICLES.

So quietly have the more recent improvements been brought about in electric vehicle construction that it is difficult to appreciate their real significance. Indeed, it is likely that the average show visitor labors under the impression that there is nothing new about the electric, and also that all electrics are pretty much alike, save in the carriage work. How falsely conceived this notion is, is revealed to the inquisitive passerby in the restaurant at the Garden, where on eight different stands, as many makers display vehicles which resemble one another in few points, except such as relate to the major specifications. In addition to the exhibits here shown, the list of adherents to the electric field is further extended by one maker who displays his cars—the Woods—on the elevated platform in the main arena, while the commercial vehicle section in the basement also boasts several electrics of the heavier type.

In proof of the assertion that novelty does exist in the electric field, despite impressions to the contrary, it is only necessary to study the construction of the Bailey victorias, shown for the first time in New York City, and mounting original features from the wheels, in which the spokes are affixed directly to the rims without the use of a wood felloe, to the steering gear, which though it may be of the common, wheel controlled pattern, is preferred by its makers when revealing an inclined steering post which is used as a tiller, while its upper end is surmounted by a segment of a wheel finished like an ordinary steering wheel, and mounting a short lever by which the motor is controlled just in the same way as the throttle of a gasolene motor is handled.

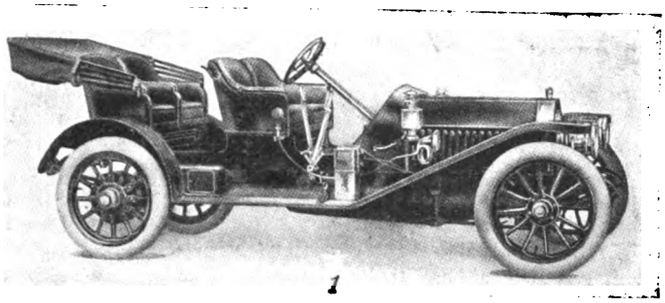


A type of vehicle which reveals less that is out of the ordinary run of electric construction, but which nevertheless is considerably improved over its predecessors, is the Waverley, in which the new Waverley Co. has embodied a large number of the traditions of the old Pope-Waverley design, together with one or two significant additions. Most noteworthy of these is the new arrangement of the power plant and its control system.

The controller, which is of the drum type, now is provided with an automatic interlocking device to safeguard the reverse against accidental operation. Only when the controller lever has been returned to its neutral position can the reverse switch be actuated, when the controller lever itself must be again brought into action to secure a flow of current. The provision of an extra notch for the lever back of the neutral position permits the short-circuiting of the motor through resistance in such a way as to constitute a powerful electric brake, suitable for emergency purposes.

Tendencies to follow the lead of the makers of gasolene machines in the construction of vehicles of the runabout order are in sharp contrast with the more familiar and seemingly no less appropriate types of inside-driven coupe or cab, such as are shown in some form by practically every electric vehicle maker. The familiar electric cab is shown on but one stand—that of the Electric Vehicle Co., other makers, however, showing approaches to it under other names—while in the Studebaker exhibit is displayed in addition to the more stereotyped patterns, a three-seated brake, mounted on solid tires and folowing closely the lines of the horsed equipage which carries the same name.

NOVELTY IN COMMERCIAL CARS.



Commercial vehicles at the Garden, while not displayed in great numbers nor in a fashion to attract attention, furnish considerable basis for study and reveal a number of interesting and novel characteristics, to one who has the patience to follow around the outer circle of the basement and discover them all. In the gasolene field, the two exhibits of heavy vehicles are placed side by side. In the Alden Sampson 2nd, display is revealed a single 4-ton truck, which at present is occupying the attention of the builder in place of the gasolene-

ELECTRIC VEHICLES STAGED WITH ITALIAN SETTING

electric road train which was shown for the first time a year ago. Original details in its construction are found in the use of a locking device whereby one of the two driving members of the spur type differential gear may be made to slide over into engagement with the pinions which mesh with the other driving member, thereby locking the countershaft ends, and so compelling the rear wheels to rotate together. The arrangement is useful in getting out of mud holes, or for running home "on one side" when a broken chain interferes with the regular operation of the drive. The double side chain drive is entirely enclosed the oil and dust proof housings being made of heavy gauge sheet steel and serving the purpose of distance rods. The chains, it should be remarked, are of the silent type.

In the Hewitt display are shown two vehicles, one of two and one of five tons capacity, the former being an entirely new design. Both are alike in having the pedal controlled, planetary change gear, double side chain drive and other original features. The smaller vehicle has a new, double-opposed motor, so arranged that all its moving parts may be removed from above. It also is noteworthy in that provision is made for heating the mixture on its way to the cylinders and after it leaves the carburetter.

Other gasolene vehicles are the Thomas taximeter cab, which was shown for the first time a year ago; the Franklin, showing in both truck and cab forms—the former having the worm drive feature, and a number of other interesting peculiarities; the Knox, which in addition to a two-cylinder truck, is shown in a high-pressure hose wagon and a chemical fire truck. The Autocar in chassis and delivery form also is in evidence, this being a new development not shown before, and comprising a double-opposed motor, unit power plant mounting, shaft drive and special form of reduction gearing at the rear axle.

In electric commercial vehicles, heavy trucks are shown at the Studebaker and General Vehicle stands, as also are several styles of delivery wagon. The latter display also includes a peculiarly light and trim little package car, rated for a 350-pound load, and the former an ambulance. The Champion Wagon Co. shows a delivery wagon which has as new features a geared reduction and silent chain drive.

Summary of Automobile Exhibits, Including New and Exclusive Features.

Gasolene Cars.

Apperson Bros. Automobile Co., Kokomo, Ind.
Apperson Gasolene Cars.

One 40 horsepower 6-cylinder baby tonneau, one 50-55 horsepower 4-cylinder touring car, one 35-40 horsepower 4-cylinder roadster, one 30-35 horsepower 4-cylinder touring car. Six-cylinder model new this year.

New features: Gear-driven oiler under hood, new valve cap.

Autocar Co., Ardmore, Pa.
Autocar Gasolene Cars.

One 26 horsepower 4-cylinder baby tonneau, one 18 horsepower 2-cylinder town car, one 18 horsepower 2-cylinder victoria, one 18 horsepower 2-cylinder 'bus, one 18 horsepower 2-cylinder chassis.

All models new design this year. Exclusive feature: Floating ring clutch design.

Cadillac Motor Car Co., Detroit, Mich.
Cadillac Gasolene Cars.

Two 30 horsepower 4-cylinder touring cars, one 30 horsepower 4-cylinder roadster, one 10 horsepower 1-cylinder runabout, one 30 horsepower 4-cylinder chassis.

Four-cylinder models entirely new this year. Exclusive features: Individual copper water jackets; special spring suspension construction; universal joint design.

Chalmers-Detroit Motor Co., Detroit, Mich.
Chalmers-Detroit Gasolene Cars.

One 40 horsepower 4-cylinder touring car, one 40 horsepower 4-cylinder runabout, one 30 horsepower 4-cylinder runabout, one 30 horsepower 4-cylinder touring car, one 40 horsepower 4-cylinder chassis, one 30 horsepower 4-cylinder chassis.

Thirty horsepower models shown for first time. Exclusive features: Spring design, motor and change gear details.

Corbin Motor Vehicle Corporation, New Britain, Conn.
Corbin Gasolene Cars.

One touring car, one limousine, one runabout, one baby tonneau, one landaulet, one chassis—all 30 horsepower 4-cylinder.

New features: Front axle construction, foot brakes external contracting, new multiplied leverage in clutch pedal, steering wheel.

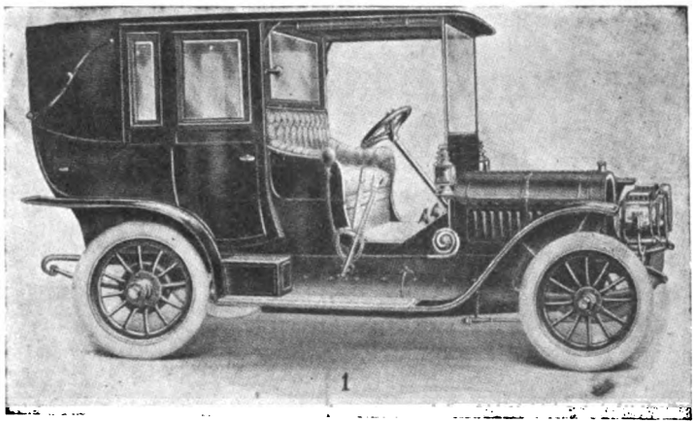
Everitt-Metzger-Flanders Co., Detroit, Mich.
E-M-F. Gasolene Cars.

One touring car, one runabout, one baby tonneau, one chassis—all 30 horsepower. First time shown.

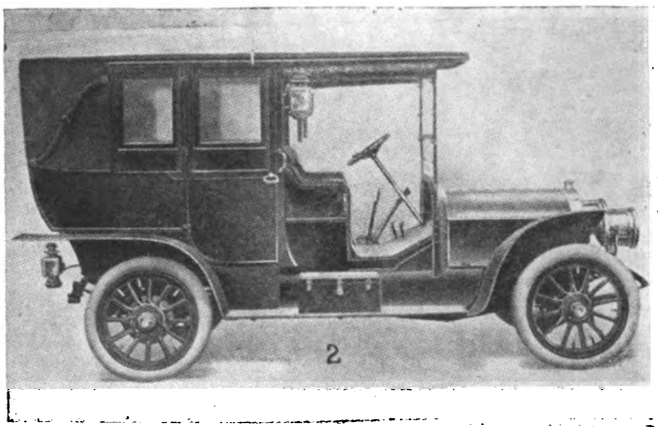
Exclusive features: Details of motor and transmission axle.

Electric Vehicle Co., Hartford, Conn.
Columbia Gasolene Cars.

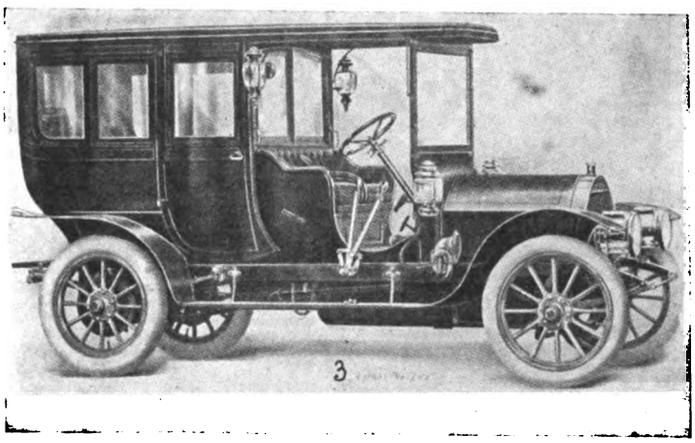
One touring car, one touring runabout, one limousine, one chassis—all 30 horsepower 4-cylinder. Motor new design.



Elmore Mfg. Co., Clyde, O.
Elmore Two-Cycle Gasolene Cars.



One 35 horsepower 4-cylinder touring car, one 24 horsepower 3-cylinder touring car, one 24 horsepower 3-cylinder limousine, one 24 horsepower 3-cylinder roadster, one 35 horsepower 4-cylinder chassis.



Exclusive features: Only 2-cycle motor shown at Garden,

Franklin Mfg. Co., H. H., Syracuse, N. Y.
Franklin Air-Cooled Gasolene Cars.

One 42 horsepower 6-cylinder touring car, one 28 horsepower 4-cylinder touring car, one 28 horsepower 4-cylinder roadster, one 18 horsepower 4-cylinder town car, one 18 horsepower 4-cylinder touring car, one 18 horsepower 4-cylinder runabout.

New feature: On 1909 models Bosch high-tension ignition only. Exclusive features: Concentric valves, auxiliary exhausts, set spark ignition, wood frame, light construction.

Haynes Automobile Co., Kokomo, Ind.
Haynes Gasolene Cars.

One touring car, one baby tonneau, one runabout, one chassis—all 40 horsepower 4-cylinder.

Exclusive features: Double-banded, water-cooled, original design.

Hewitt Motor Co., New York City.
Palmer & Singer Gasolene Cars.

One 60 horsepower 6-cylinder baby tonneau car, one 30 horsepower 4-cylinder Skimabout, one 30 horsepower 4-cylinder landaulet town car, one 60 horsepower 6-cylinder chassis. First time shown.

Exclusive features: Double drop frame on town car chassis, universal mounting for the radiator, selective gearset design.

Knox Automobile Co., Springfield, Mass.
Knox Gasolene Cars.

Two limousines, one touring car, one close-coupled body touring car, one roadster, one raceabout—all 32-38 horsepower 4-cylinder.

Locomobile Co. of America, Bridgeport, Conn.
Locomobile Gasolene Cars.

One 40 horsepower 4-cylinder touring car, one 40 horsepower 4-cylinder runabout, one 30 horsepower 4-cylinder touring car, one 30 horsepower 4-cylinder limousine, one 30 horsepower 4-cylinder baby tonneau, one 30 horsepower 4-cylinder chassis, and Vanderbilt Cup winner.

New feature: Shaft drive on 30 horsepower models.

Lozier Motor Co., New York City.
Lozier Gasolene Cars.

One 50 horsepower 6-cylinder touring car, one 45 horsepower 4-cylinder limousine, one 45 horsepower 4-cylinder Briarcliff toy tonneau, one 45 horsepower 4-cylinder chassis, one 35 horsepower 6-cylinder chassis.

New features: Oiler, manifold, aluminum steering gear housing, foot accelerator. "Light Six" model entirely new design.

Matheson Motor Car Co., Wilkes-Barre, Pa.
Matheson Gasolene Cars.

One 50 horsepower 6-cylinder touring car, one 45-50 horsepower 4-cylinder touring car, one 45-50 horsepower 4-cylinder limousine, one 50 horsepower 6-cylinder chassis, one 45-50 horsepower 4-cylinder chassis—6 cylinder model new.

New feature: Jump-spark ignition on 6-cylinder model.

Packard Motor Car Co., Detroit, Mich.
Packard Gasolene Cars.

One 30 horsepower 4-cylinder limousine, one 30 horsepower 4-cylinder close-coupled body touring car, one 18 horsepower 4-cylinder landaulet, one 30 horsepower 4-cylinder chassis—18 horsepower model new this year.

Peerless Motor Car Co., Cleveland, O.
Peerless Gasolene Cars.

One touring car, one close-coupled touring car, one limousine, one runabout, one chassis—all 30 horsepower 4-cylinder.

Pierce Co., The George N., Buffalo, N. Y.
Pierce-Arrow Gasolene Cars.

One 60 horsepower 6-cylinder limousine, one 48 horsepower 6-cylinder limousine, one 36 horsepower 6-cylinder brougham, one 36 horsepower 6-cylinder runabout, one 48 horsepower 6-cylinder chassis—48 horsepower model new.

New features: Gear-shift control changed from post to side levers, twin cylinder castings, redesign of valve mechanism and piping.

Pope Manufacturing Co., Hartford, Conn.
Pope-Hartford Gasolene Cars.

Two touring cars, one "pony tonneau," one roadster, one limousine—all 40 horsepower 4-cylinder.

New features: Clutch, brakes and torsion group; engine redesigned.

Pope Motor Car Co., Toledo, O.
Pope-Toledo Gasolene Cars.

One touring car, one folding brougham, one close-coupled body touring car, one roadster—all 50 horsepower 4-cylinder.

New features: Oiling system improved, minor changes in chassis.

Royal Motor Car Co., Cleveland, O.
Royal Tourist Gasolene Cars.

Two touring cars, one limousine, one chassis—all 48 horsepower 4-cylinder. New design this year.

New features: Self-starting device, ignition wiring, manifold, dust-pan in front of radiator.

Selden Motor Vehicle Co., Rochester, N. Y.
Selden Gasolene Cars.

One touring car, one close-coupled body, one limousine, one roadster, one chassis—all 29 horsepower 4-cylinder.

New features: Motor design new, model larger than last year.

Simplex Automobile Co., New York City,
Simplex Gasolene Cars.

One touring car, one baby tonneau, one chassis—all 50 horsepower 4-cylinder.

Stearns Company, F. B., Cleveland, O.
Stearns Gasolene Cars.

One 30-60 horsepower 4-cylinder roadster, one 30-60 horsepower 4-cylinder touring car, one 15-30 horsepower 4-cylinder touring car, one 15-30 horsepower 4-cylinder limousine, one 15-30 horsepower 4-cylinder chassis, one 30-60 horsepower 4-cylinder chassis. The 15-30 horsepower models are new design, shaft-drive; 30-60 horsepower cars shown in both shaft and chain-drive models.

Exclusive features: Block motor, transmission axle design.

Stevens-Duryea Co., Chicopee Falls, Mass.
Stevens-Duryea Gasolene Cars.

One 40 horsepower 6-cylinder touring car, one 35 horsepower 6-cylinder limousine, one 24 horsepower 4-cylinder touring car, one 24 horsepower 4-cylinder runabout, one 24 horsepower 4-cylinder limousine, one 40 horsepower 6-cylinder chassis. The 24 horsepower car new design.

Exclusive features: Three-point suspension system for power plant; carburetter design, self-finding progressive gear shift.

Studebaker Automobile Co., South Bend, Ind.
Studebaker Gasolene Cars.

One 40 horsepower 4-cylinder touring car, one 40 horsepower 4-cylinder limousine, one 40 horsepower 4-cylinder toy tonneau, one 30 horsepower 4-cylinder "Suburban," one 40 horsepower 4-cylinder chassis.

New features: Bosch magnetic spark plugs, original design wicker body on "Suburban" model, new automatic air valve, redesign of steering gear.

Thomas Motor Co., E. R., Buffalo, N. Y.
Thomas Gasolene Cars.

One 70 horsepower 6-cylinder toy tonneau, one 40 horsepower 6-cylinder touring car, one 60 horsepower 4-cylinder limousine, one 60 horsepower 4-cylinder touring car, one 40 horsepower 6-cylinder chassis, and New York-Paris race winner. Light 6-cylinder model new design.

New features: Clutch enclosed, 3-plate type; new model, triple cylinder engine units, axle-mounted change gear, double ignition with duplicate spark plugs.

Walter Motor Car Co., Trenton, N. J.
Walter and Roebling-Planche Gasolene Cars.

Walter cars: One 50 horsepower 4-cylinder touring car, one 20 horsepower 4-cylinder town car, one 50 horsepower 4-cylinder chassis, all new models.

One Roebling-Planche 100 horsepower 4-cylinder racer, new model.

New features: Radiator mounting, torque group redesigned, automatic ball valves in carburetter.

Winton Motor Car Co., Cleveland, O.
Winton Gasolene Cars.

One touring car, one landaulet, one toy tonneau, one roadster, one chassis—all 48 horsepower 6-cylinder, and one 60 horsepower 6-cylinder touring car. Light car new design.

Exclusive features: Carburetter design, self-starting gear.

White Company, The, Cleveland, O.
White Steam Cars.

Two 40 horsepower touring cars, one 40 horsepower limousine, one 40 horsepower runabout, one 20 horsepower touring car, one 20 horsepower landaulet, one 20 horsepower chassis. The 20 horsepower models and 40 horsepower runabout design new this year.

New feature: Pressed steel frame in 40 horsepower runabout.

Electric Pleasure Vehicles.

Anderson Carriage Co., Detroit, Mich.
Detroit Electric Cars.

One coupe, one victoria, one brougham and one chassis, 24 cells, and one runabout, 16 cells.

Babcock Electric Carriage Co., Buffalo, N. Y.
Babcock Electric Cars.

One town car, 42 cells; one coupe, 36 cells; one victoria, 36 cells; one runabout, 40 cells, one Stanhope, 36 cells, one runabout, 36 cells, one chassis, 36 cells. Town car, coupe and light runabout new models.

Bailey & Co., S. R. (Inc.), Amesbury, Mass.
Bailey Electric Cars.

Two victoria phaetons, 30 cells; one model with steering wheel and one with lever steer.

Digitized by Google

Exclusive features: Lever steering construction; power control on segment of wheel, automatically shut off by foot brake; underslung battery with 3-point suspension.

Baker Motor Vehicle Co., Cleveland, O.
Baker Electric Cars.

One roadster, 40 cells; one runabout, 30 cells; one town car, 30 cells; one extension front coupe, 28 cells; one victoria, 24 cells; one runabout chassis, 30 cells. Victoria, coupe and roadster models are new design.

Exclusive feature: Non-sparking commutator; imported ball-bearings in motor.

Electric Vehicle Co., Hartford, Conn.
Columbia Electric Cars.

One brougham, 40 cells; one victoria, 20 cells. Victoria new design.

Exclusive features: Live rear axle design and enclosed transmission.

Rauch & Lang, Cleveland, O.
R. & L. Electric Cars.

Two Stanhopes, one extension coupe, one runabout, one chassis—all 24 cells and all new models.

Studebaker Automobile Co., South Bend, Ind.
Studebaker Electric Cars.

One high speed Stanhope, 36 cells; one victoria phaeton, 28 cells; one runabout, 24 cells; one Stanhope, 24 cells. Stanhope and victoria models new this year.

Exclusive features: Special safety switch, one-third of battery in front and two-thirds in rear, four speeds forward and four reverse.

Waverley Co., The, Indianapolis, Ind.
Waverley Electric Cars.

Two town cars, two runabouts, one Stanhope, all 30 cells. Town cars are new models.

Exclusive features: Automatic safety, control system silent chain and gear transmission.

Woods Electric Co., Chicago, Ill.
Woods Electric Cars.

Two inside operated broughams, 2 victorias—all 40 cells.

Exclusive features: Individual chain drive adjustment, completely housed; imported ball bearings throughout; unit assembly power plant, easily removable.

Commercial Vehicles.

Autocar Co., Ardmore, Pa.
Autocar Gasolene Cars.

One 18 horsepower 2-cylinder chassis, one 18 horsepower 2-cylinder delivery wagon. New design this year.

Exclusive features: Unit power plant and rear axle construction.

Baker Motor Vehicle Co., Cleveland, O.
Baker Electric Cars.

One 1-ton capacity, 42 cells, commercial truck chassis.

Exclusive features: Non-sparking commutator; imported ball bearing motor.

Champion Wagon Co., Oswego, N. Y.
Champion Electric Wagons.

One 1,000 lbs. capacity, 40 cells, delivery wagon, new design.

New features: Gear reduction with Morse silent chain; annular ball bearings.

Franklin Co., H. H., Syracuse, N. Y.
Franklin Air-cooled Gasolene Cars.

One 18 horsepower 4-cylinder, 1,000 lbs. capacity, delivery wagon; one 18 horsepower 4-cylinder, 2-ton stake truck; one 18 horsepower 4-cylinder taximeter cab—all air-cooled and all new designs this year.

Exclusive features: Worm gear drive in axle, wood sills, concentric valve, air-cooled motor with auxiliary exhaust.

General Vehicle Co., Long Island City, N. Y.
Electric Trucks.

One 3½-ton truck, one 2-ton truck, one 1-ton truck, one 1,000-lbs. delivery wagon, one 350-lbs. delivery wagon.

New features: Pressed steel frame, Morse chains, P. & S. battery.

Hewitt Motor Co., New York City.
Hewitt Gasolene Trucks.

One 25 horsepower 2-cylinder 2-ton chassis, one 28 horsepower 4-cylinder 5-ton truck. Two-cylinder model new design.

Exclusive features: Planetary transmission, removable cylinders; block tires.

Knox Automobile Co., Springfield, Mass.
Knox Gasolene Cars.

One 48 horsepower 4-cylinder high pressure hose wagon, one 36 horsepower 4-cylinder chemical combination wagon, one 20 horsepower 2-cylinder 3,000-lbs. truck. Four cylinder models new this year.

Sampson Mfg. Co., Alden, Pittsfield, Mass.
Alden Sampson Gasolene Trucks.

One 40 horsepower 4-cylinder 4-ton truck, new design.

Exclusive features: Differential lock, enclosed chains.

Studebaker Automobile Co., South Bend, Ind.
Studebaker Electric Trucks.

One 5-ton truck, one 2,500-lbs. express wagon, one 1,500-lbs. delivery wagon, one 850-lbs. delivery wagon, one 1,500-lbs. capacity station bus, one 800-lbs. ambulance.

Thomas Motor Co., E. R., Buffalo, N. Y.
Thomas Gasolene Taximeter Cabs.

Two 16-20 horsepower 4-cylinder taxicabs.

Exclusive features: Block type motor, multiple disc clutch.

MOTORCYCLES AND THEIR ACCESSORIES SEPARATELY ARRAYED.

American Motor Co., Brockton, Mass., M-M—Three 6 horsepower 2-cylinder, five 3½ horsepower single cylinder motorcycles; one 3½ horsepower single cylinder side car.

Aurora Automatic Machinery Co., Aurora, Ill., Thor—Two 3 horsepower single cylinder, one 2¼ horsepower single cylinder, one 3¼ horsepower single cylinder, two 6 horsepower 2-cylinder motorcycles.

Auto-Bi Co., The, Buffalo, N. Y., Greyhound—Two 3 horsepower single cylinder motorcycles.

Consolidated Mfg. Co., Toledo, O., Yale—Two 3½ horsepower single cylinder motorcycles.

Crouch Motor Co., Stoneham, Mass., Crouch—Two 3 horsepower single cylinder motorcycles.

Curtiss Mfg. Co., G. H., Hammondsport, N. Y., Curtiss—One 3 horsepower single, one 3½ horsepower single, one 6 horsepower 2-cylinder, one 7 horsepower 2-cylinder, one 10 horsepower 3-cylinder motorcycles.

Excelsior Supply Co., Chicago, Ill., Excelsior—Three 3½ horsepower single cylinder motorcycles.

Harley-Davidson Motor Co., Milwaukee, Wis., Harley-Davidson—Two 4 horsepower single, one 7 horsepower 2-cylinder motorcycles.

Hendee Mfg. Co., Springfield, Mass., Indian—Two 2¾ horsepower single, two 3½ horsepower single, four 5 horsepower 2-cylinder, one 7 horsepower 2-cylinder motorcycles.

Merkel-Light Motor Co., Pottstown, Pa., Merkel and Light motorcycles—Two 2¼ horsepower single cylinder Light motorcycles, one 3½ horsepower single cylinder Light, two 3½ horsepower single cylinder Merkel, one 7 horsepower 2-cylinder Merkel motorcycles.

N. S. U. Motor Co., New York City, N. S. U.—One 3 horsepower single, one 3 horsepower 2-cylinder, one 1½ horsepower single, one 3½ horsepower single, one 4 horsepower single, one 6 horsepower 2-cylinder motorcycles; one 6 horsepower 2-cylinder tri-car, one 6 horsepower 2-cylinder side car.

National Sales Corporation, New York City, Peugeot—One 5-7 horsepower 2-cylinder Simplex-Peugeot; one 5-7 horsepower 2-cylinder All-Right motorcycle.

New Era Gas Engine Co., Dayton, O., New Era—One 3½ horsepower single cylinder motorcycle.

Ovington Motor Co., New York City, F. N.—One 5 horsepower 4-cylinder, one 2¼ horsepower single cylinder motorcycles.

Pierce Cycle Co., Buffalo, N. Y., Pierce—Three 6-7 horsepower 4-cylinder motorcycles.

Reading Standard Co., Reading, Pa., R-S—Three 3½ horsepower single, one 4 horsepower single, one 6 horsepower 2-cylinder, one 7½ horsepower 2-cylinder motorcycles; one 6 horsepower 2-cylinder chair car, one 4 horsepower single cylinder non-convertible delivery car.

Reliance Motorcycle Co., Owego, N. Y., Reliance—One 2 horsepower single, one 3 horsepower single, one 3½ horsepower single, one 5 horsepower 2-cylinder, one 7 horsepower 2-cylinder motorcycles.

Royal Motor Co., Worcester Mass., Royal Pioneer—One 4-4½ horsepower single cylinder motorcycle.

Walton Motor Co., Inc., Lynbrook, L. I., Midget Bi-Car—Two 3½ horsepower single cylinder Bi-Cars.

Motorcycle Accessories.

Baker & Co., F. A., New York—Supplies.

Eclipse Machine Co., Elmira, N. Y.—Coaster brakes.

Mesinger Mfg. Co., H. & I., New York City—Saddles.

Motor Car Equipment Co., New York City—Spark plugs and supplies.

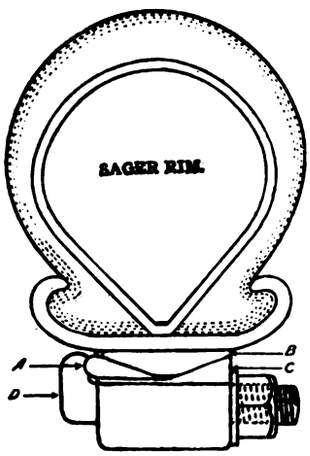
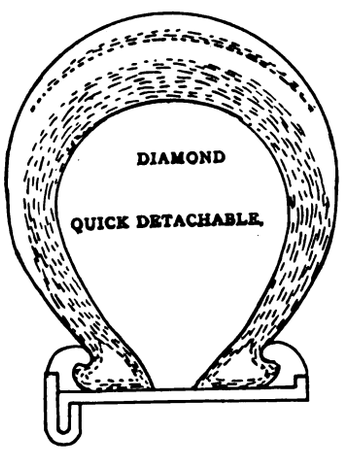
Where Progress in Tires, Parts and Accessories is Shown

When a big glass globe broke in the concert hall and let loose a heavy cascade of steel balls of all sizes, which tumbled to the floor with a noise like magnified musketry, a crowd gathered to see what would happen next. Only a few, observing the shattered remains of the globe, realized that the incident was accidental, the weight of the balls having proved too much for the containing glass. The others assumed that the racket and shower of bearings was but a preliminary to some demonstration stunt, and it required explanation on the part of the attendants at the Standard Roller Bearing Co.'s space to convince them that nothing more of a sensational character might be expected. All of which was very natural because of the very extraordinary things the exhibitors in the accessory section are doing to attract the visitors' attention and show off the products.

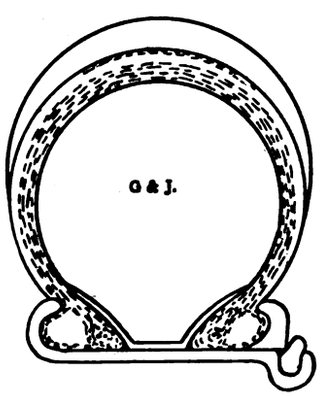
From frivolous fittings such as silver eagles for radiator caps, through the range of accessories to the vital and important things such as chains, the exhibit of Charles E. Miller, New York, in the second gallery, presents lines which represent the ripest experience in the selection of goods that will meet both popular demand and whatever technical requirements their nature imposes. The celebrated Brampton chains, for which Miller is the American distributor, are but one line of foreign novelties which are disclosed at the Miller space. A gasolene searchlight, of 15,000 candlepower, in which the fuel is utilized to heat an incandescent mantle, is a French importation which indicates the Miller proclivity for promptly bringing over the latest and best of Europe's accessory offerings. The general array of horns, lamps, plugs, tire supplies, clocks, jacks and fittings shown is the subject of interest and study by both dealers and retail purchasers.

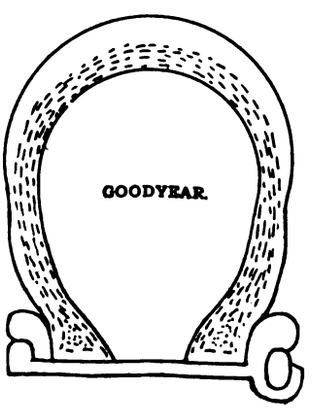


At the space of the Motor Car Equipment Co., of New York, which is located in the basement, imported specialties have a prominent place, the list of articles on view including Pirelli ignition cable, Peugeot chains, Blanchard horns, French plugs, English pumps, the latest foreign universal pump connections, and a host of minor novelties. The domestic goods predominate, however, and include, beside standard lines of well known accessories, a number of new things which have not been shown before.



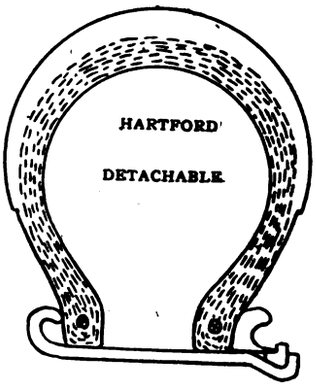
Rear signals for cars, to indicate to the traffic behind which way the driver intends to turn, are shown at two spaces, and represent the newest ideas in this direction. In the "Isti", shown by A. R. Mosler & Co., the device takes the form of a revolvable disc which is fitted over the rear lens of the tail lamp. The disc is perforated with the words "right", "left", and "stop" and by means of a flexible wire connection from the driver's seat the disc may be turned to bring the proper word into the horizontal position so that it may be read. To provide for daylight service, the disc is crossed with a broad arrow which points to the right or left and to the upward position for "stop". The Dimond electric traffic signal, staged by the Dimond Igniter Co., is a black box affixed to the rear of the vehicle. For the three signal positions three push buttons are arranged ready to the driver's hand. Semaphore arms swing up from the open sides of the box in accordance with which button is pressed, the blades bearing the signal of "right", "left", or "stop".



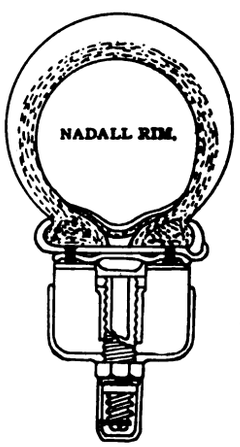


ACCESSORIES UNDER THE RED ROSE TRELLIS IN CONCERT HALL

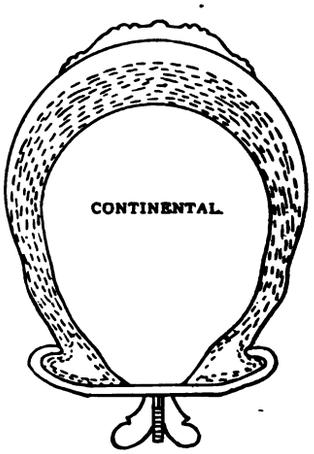
Digitized by Google



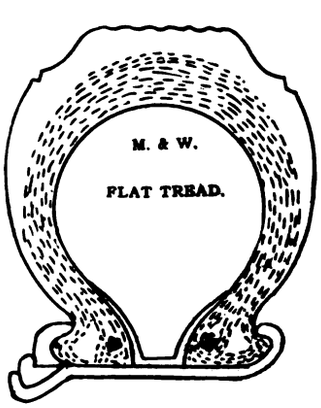
Except for the fact that on Wednesday the exhibit of the Michelin Tire Co., of Milltown, N. J., moved out bag and baggage from the show, because the space in which Michelin tires were obliged to appear was not worthy of the reputation of the product, the tire representation is very complete. The Diamond Rubber Co., of Akron, O., exhibits not only the various types of Diamond tires, including the new "Diamond grip" tread, but also stages the improved Diamond demountable rim. The Goodyear quick acting rim and the new air bottles form supplementary exhibits for the display of Goodyear tires at the space of the Goodyear Tire & Rubber Co., of Akron. The peculiar tread on the new Firestone non-skid tires, formed of raised rubber letters, marks them conspicuously not only in the booth of the Firestone Tire & Rubber Co., Akron, but also on the many show cars of which they are equipment. At the Firestone stand these are but a small part of the total showing, which comprises a full line of pneumatics and solids, not to mention the Firestone demountable rim.



Continental tires of the several types are the base of the display of the Continental Caoutchouc Co., of New York, but the Continental demountable rim is featured, also. The new "universal, standard, quick detachable rim" is offered not only by the Hartford Rubber Works Co., of Hartford, Conn., but by Morgan & Wright, of Detroit, Mich., and the G & J Tire Co., of Indianapolis. Each of these exhibitors, however, has an individual and distinctive line of tires to offer. Quite a number of demountable rims of ingenious construction are presented by other than tire manufacturers, including the Sager, made by the J. H. Sager Co., of Rochester, N. Y., and the Nadall and Dow types In the tire accessories the Weed chains of the Weed Chain Tire Grip Co., New York, appear as proved successes, while A. C. Bricrson, of Brookings, S. D., is a newcomer, with a line of non-skid treads which may be used over the regular tires.



Radically different from all the other ignition systems revealed at the Garden is the Seeley system, mounted by the High Frequency Ignition Coil Co., of Los Angeles, Cal. Each cylinder of the motor, under the Seeley arrangement, is equipped with an individual coil supplying high tension current to the spark plug. The coils are small affairs, very short and only about three inches in diameter. They have no iron cores, but utilize simple solenoid windings. A distributer directs the primary current to each coil in turn. One of the features of the system, however, is the fact that the primary current has a coil and condenser of its own, which may be mounted on the dash or elsewhere. This coil has an iron core and also a condenser, the action of the latter providing a mysterious alternating effect which influences the unit secondary coils at the cylinders to give a very remarkable discharge. No vibrator is used, and it is claimed for the system that great simplification and current economy are secured.



Magnetos are scattered all through the accessory division, the more famous ones including those of Bosch, Splitdorf, Remy, Heinze, Bretz's U. & H., and Witherbee's Volta, not to mention the recent productions of Wheeler and Pittsfield. A large space is taken by the Bosch Magneto Co., New York, to stage the Bosch line in both high and low tension magnetos. The Splitdorf Laboratory, New York, has coils, plugs and a demonstration outfit, supplementing its magneto, and the space of the Witherbee Igniter Co., New York, contains all manner of coils, timers, distributers, plugs, accumulators and handy lamps in addition to the Volta. Eight times as big as regular size, the huge ignition outfit put up by the Heinze Electric Co., of Lowell, Mass., attracts a generous share of attention, and serves to make plain the merits of the Heinze plugs, switches and coils. The neat little steering wheel switch, produced by the Connecticut Telephone & Electric Co., of Meriden, Conn., is attached to a real steering wheel so that its action may be apparent. It permits the ignition circuit to be controlled for either battery or magneto or both, without reaching down to the coil. The other "Connecticut" specialties, such as coils, kick switches, meters and terminals have advantageous settings.

For the Garden show a new display arrangement for Stewart speedometers and clocks has been prepared, presenting all the models in a row under powerful electric light. The Jones speedometers, clocks, annunciators and taximeters have the benefit of a conspicuous

VARIOUS IMPROVEMENTS IN MAGNETO DESIGN

location, while nearby the Warner autometers are disclosed in complete and instructive array.

In lamps the Badger Brass Mfg. Co., of Kenosha, Wis., and New York City, are among the best known and prominent exhibitors, the Solar line having a variety of types extending from small oil and electric illuminators to the large searchlights equipped with the Solar eclipsing device. The Wridgway "no glare" shade for headlights is effectively demonstrated at the Gray & Davis space, in a lamp containing a brilliant electric bulb. The numerous styles of Gabried horn made by the Gabriel Horn Mfg. Co., of Cleveland, O., comprise the main feature of the company's appeal to the public and trade, but the Gabriel shock absorber is also represented, with 1909 improvements.

Parts are heavy factors at the show, the list including the axles and bearings of such concerns as the Timken Roller Bearing Axle Co., the Standard Roller Bearing Co., and the American Ball Bearing Co., while the J. S. Bretz Co., of New York, offers the imported F. & S. annular ball bearings. Castings of almost every conceivable type, so far as motor car construction is concerned, are to be found in aggregate of such exhibits as those of the William Cramp & Sons Ship & Engine Building Co., the Manufacturers' Foundry Co. and the large list of others with showings of casting work in special metals. Radiators have exemplification in the Briscoe, domestic chains in the Diamond, while the offerings of tools and specialties, such as Perfection wrenches, Columbia lock nuts, Chandler nameplates and the like, gives proof of the wide ramifications and detail amplification which is accompanying the industry.

Flashy medals, buttons, picture books, calendars and similar remembrances reward the souvenir hunters and advance the cause of the stand attendants with the ladies, while the small boys find great delight in the paper "snappers" which when swung quickly in the air give off a report like a fat firecracker and which are given with a free hand at one of the third tier box exhibits. To members of the trade several concerns are making distributions of valuable and characteristic tokens. In the comfortable enclosure of their own show spaces not a few of the accessory people, with their friends, try at times to steal a concealed smoke, but the severe discipline in this respect that is apparent at the front entrance, where all lighted cigars and cigarettes must be thrown away, extends to the farthest recesses of the galleries, and sly smoking attempts are promptly stopped.

The complete list of accessory exhibitors is as follows:

ACCESSORY EXHIBITS.

A-Z Co., The, New York City—Hoods, radiators and tanks.

Ajax-Grieb Rubber Co., New York City—Ajax tires.

Allen Auto Specialty Co., New York City—Tire jackets and specialties.

Allers Co., H. A., New York City—Solarine Metal Polish.

American Ball Bearing Co., Cleveland, O.—Ball bearings and axles.

American Electrical Novelty & Mfg. Co., New York City—Ever Ready Batteries, lamps and tire specialties.

American Electric Fuse Co., New York City—Igniter and magnet wire.

American Thermos Bottle Co., New York City—Thermos bottles.

American Thermo-Ware Co., New York City—Goggles, hydrometers.

American & British Mfg. Co., Bridgeport, Conn.—Motors and parts.

Anderson Forge Machine Co., Detroit, Mich.—Crankshafts, gears.

Apple Electric Co., Dayton, O.—Ignition systems.

Atlas Rubber Co., Buffalo, N. Y.—Non-puncturable inner cases.

Atwater-Kent Mfg. Works, Philadelphia, Pa.—Igniters and timers.

Atwood-Castle Co., Amesbury, Mass.—Lamps.

Austro-American Separator Co., Cleveland, O.—Gasolene funnels.

Autocoil Co., Jersey City, N. J.—Spark coils.

Auto Improvement Co., New York City—Self starting devices and motor specialties.

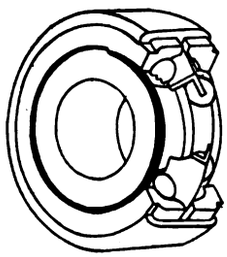
Auto Pump Co., Springville, N. Y.—Pumps.

Auto Supply Mfg. Co., Brooklyn, N. Y.—Horns, tubing and brass specialties.

Auto Tire Inflating Co., Brooklyn, N. Y.—Wyman tire tanks.

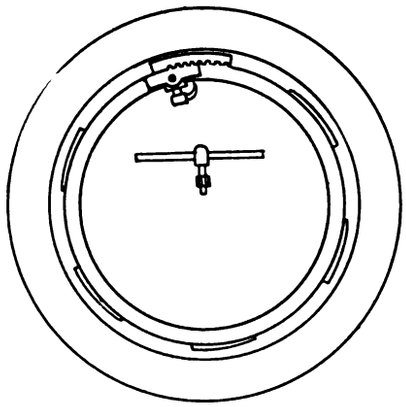
Avery Portable Lighting Co., Milwaukee, Wis.—Gas tanks.

Badger Brass Mfg. Co., New York City and Kenosha, Wis.—Solar lamps and acetylene generators.



Baker Mfg. Co., New Haven, Conn.—Spark plugs.

Baldwin Chain and Mfg. Co., Worcester, Mass.—Baldwin chains and recoil check.



Balzer, Gus, New York City—Bouquet holders, connecters, generators and supplies.

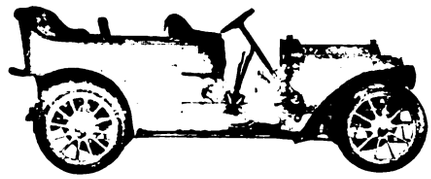
STUDEBAKER ARMY DESPATCH CAR, which made wonderful record from New York to Fort Leavenworth, Kansas, last winter, leaving New York six days after the "New York to Paris" racers and BEATING THEM ALL into Chicago.

THE STUDEBAKER "thirty" was selected for this "War Test Endurance Grind," because of its known reliability.



¶ The conditions were the most severe ever encountered in any automobile endurance test, and, notwithstanding the horrible abuse the car received in this record-breaking run, it was re-entered in the recent Glidden Tour and made a perfect score.

¶ This was an ordinary stock chassis of the same type as is used for the popular STUDEBAKER Town Cars and Suburbans, and such a car, backed by such a concern as the Studebaker Company, is a sane and dependable business proposition for any prospective automobile buyer.

PHILADELPHIA:
330 North Broad Street

THERE is nothing which should be more thoroughly investigated before purchasing than an automobile.

The crowded conditions of automobile shows make a thorough investigation, to say the least, tiresome.

In view of this fact, the Studebaker Company, in addition to its exhibit at the Madison Square Garden, will devote its entire ground floor of the Studebaker Building, at Broadway and Forty-eighth Street, to the LARGEST and MOST EXTENSIVE DISPLAY of motor vehicles of one make EVER HELD IN THIS COUNTRY.

Although the Studebaker Company is the largest single exhibitor at the Madison Square Garden Show, this special display at the Studebaker Building has been arranged to allow a more leisurely and thorough investigation of the Studebaker line.

This special exhibit will be open from January 2d to 23d inclusive, and every interested person is cordially invited to call at either or both exhibitions. The company would like to extend a special invitation to out-of-town automobilists, but everyone will be so cordially welcomed that a "preferential bid" is hardly possible.

A Studebaker enclosed electric omnibus will run on regular schedule between the Studebaker Building and the Automobile Show.

Limousine.

Electric Runabout

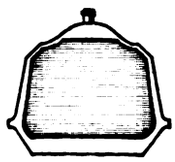
STUDEBAKER Automobiles are designed for service—constantly and under all sorts of conditions.

A Studebaker chassis, with a closed body, can be used all winter, and affords the maximum of elegance and convenience.

Replace the closed with an open body and it can be used all summer, and you get the maximum of reliability and comfort.

In other words, the Studebaker chassis is designed for service—there's not too much of it for a town car nor too little of it for a touring car. It's built to do the work and it does it, and it is backed by the most liberal guarantee ever written.

If you are an automobile engineer an inspection of the Studebaker car will prove a mechanical treat—its design and construction speak for themselves.



If you are not versed in engineering principles it's all the more reason why you should buy a Studebaker, as all the experience and facilities of this great organization are behind it.

A Studebaker Electric is better than a pony cart for the children. It costs half as much to maintain, goes twice as far, and cannot run away.

STUDEBAKER Electrics are the quick, willing servants of the entire family. Luxurious, immaculately clean and noiseless. Require no chauffeur, can be charged on your own premises automatically and are absolutely safe. For the business man a STUDEBAKER Electric is a time saver and a money saver. It connects him in a moment with his office, his attorney, his club or his home. For woman's use it is the ideal means of conveyance. Its daintiness and luxuriousness of appointments instantly appeal to her refined taste. For shopping, for social calls and the like it is indispensable.

¶ The STUDEBAKER show rooms contain the largest line of automobiles ever displayed on Broadway.

DEAD HEATS IN A LIVELY MEET

De Hymel Captures Honors in San Antonio Hill Climb—His Sensational Encounter with Rails of Steel.

Three dead heats in as many events, did not mean a dead meet by any means, when the San Antonio (Tex.) Automobile Club ran its oft-postponed hill-climb on Sunday, 10th inst., on the Wetmore slope in that city. Although the entry list was not large, a good-sized crowd of spectators turned out, expecting to see all sorts of thrills, as is often the wont of crowds. They had at least one opportunity to witness a sensation. This was when Tobin De Hymel, a driver who stacks up as something of a driver in those parts, shot a Stoddard-Dayton roadster up the incline with some spectacular trimmings attached to the performance. He proceeded to take the numerous curves in the course with apparent daredevil sang froid, until he struck a line of car tracks at one of the turns and caught his rear tires in them. The encounter with the steel rails served to swing his car towards its starting point and a turtling seemed inevitable, when De Hymel suddenly gained control and brought his mount to a standstill. Then heading its radiator in the right direction, he continued the climb in most reckless fashion.

The crowd liked it and hoped there would be more pyrotechnics, but no more thrills were granted them. The only other excitement of the afternoon, was when V. P. Kenny, in a Packard, tied in three different trial heats with a Stoddard-Dayton touring car. In one heat the half mile was covered in 45 seconds and the other two in 0:45⅗. It was agreed to have these cars enter the free-for-all, in an effort to evolve a winner, that event to decide the contest between the two.

When the contenders went at it, De Hymel, in the Stoddard-Dayton, slammed up the hill after the fashion of a young meteor, to the tune of 0:42⅖, winning the chief honors of the day. The Stoddard-Dayton touring car entry nosed out its rival, the Packard, driven by Kenny, for second place and Dusenberry's Mason car was fourth.

The latter entry proved a surprise earlier in the day, when Dusenberry sent it up the grade in 46⅕ seconds in a touring car event, and outclassed the rest of his field.

K. G. Wickwire took a flyer up the course on a motorcycle and succeeded in bouncing over the finish line at 50 seconds flat.

Winton Suggests New Plan for Contests.

That endurance contests have failed in their purpose is the expressed opinion of Alexander Winton, president of the Winton Motor Carriage Co., and he has formulated plans for a contest which he believes will be more enlightening in its results. They provide for a pool to be made up by the payment of $2,000 by each manufacturer, as an entrance fee, securing him the right to have any or all of his cars of current model entered, providing the owners of such cars desire to compete. The manufacturers themselves are not eligible as competitors, as is made evident in the proposed rules, which follow:

1—Individual entries must be made two months before the start of the contest.

2—No car shall be eligible to start except it be driven by its owner or his employed chauffeur. In case the chauffeur drives, it must be shown that he has been continuously in the employ of this particular owner at least three months before the start of the contest, and that he has not within six months of the date of the start, been in the employ of the manufacturer of the car or of any agent selling that particular make.

3—No car shall be eligible to start unless its maker shall have paid the $2,000 entrance fee.

4—No car shall be eligible to start unless it shall be shown that it has been in the possession of its present owner three months prior to the start of the contest, or shall have made a mileage of 3,000 miles in the service of its present owner, and that it has not been overhauled within or since the three months or 3,000-mile period.

5—No car shall be eligible to start unless the owner at the time of making entry pays a fee of $200, which fee shall be used by the managing association toward the expenses of the contest.

The pooled entrance fees paid in by the manufacturers are to be disposed of in accordance with a scheme dividing the money into three classes of prizes, to be given to the winners in cash or plate, as the winner in each case may elect. The classes suggested are: First, cars costing $4,000 or more; second, cars costing between $2,500 and $3,999; and third, cars costing less than $2,500; with first, second and third prizes for each class.

In accordance with the general plan the manufacturer's entrance fee is to be paid at least six months before the start of the contest, and where he gets his "look in" is the opportunity afforded to advertise that his cars are eligible to compete.

Old Lakebed for a Motordrome.

Tex Rickard and other wealthy mining men of Goldfield, Nev., are pushing their plans, already announced in the Motor World, to make their city a center of automobile sport. With a view to holding a grand series of races they have secured a large tract out on the desert, about 12 miles from Goldfield, where a circular track 15 miles in circumference has been defined and successfully tried out. The locality is a dry lakebed of great extent, level as a floor and hardened by centuries of baking under the sun. Spectators will be able to see races from start to finish.

EVERY WOMAN WINS AN HONOR

Trophies for Six Contestants in the New York-Philadelphia-New York Run—Certificates for Others.

After puzzling his head and biting his pencil for three consecutive days, the Woman's Motoring Club of New York made final decision of the winning contestants in the New York-Philadelphia-New York endurance run, on Friday last. The net statistical outcome of the event, which took place on Monday and Tuesday, 11th and 12th inst., is this: Ten lady drivers started and finished the contest; six of them received trophies—all the trophies there were—and the remaining four received honorable mention, some of which also was distributed among the plate-winners. The actual distribution of honors in the event as announced by the man management of the contest was as follows, though the business of presentation is yet to be accomplished:

The Benjamin Briscoe bronze trophy, offered for the driver making the best showing in a Maxwell car, was given to Mrs. John R. Ramsey, of Newark, N. J. The Fosdick, a trophy for the best score, barring the Lancia entry of the donor, went to Mrs. A. W. Seaman of Brooklyn, who piloted a Franklin. W. J. Morgan's bronze placque was won by Mrs. Evelyn M. Buckman, who handled a Renault. Had she not been foolish enough to carry a man in her party, her score, in the estimation of the committee, would have been higher. Mrs. Cuneo was the recipient of the trophy offered by Hugh Chalmers. At the wheel of the Lancia "Lampo," the Savannah light car race winner, Mrs. Cuneo was the first to arrive at Philadelphia and also the first home on the return to New York. Miss Alice D. Hayes, of Brielle, N. J., secured the cup donated by the club itself. Her 30 horsepower Cadillac carried the greatest number of passengers on each trip—five altogether. The Schwalbach trophy went to none other than Mrs. Anna Back, who drove a Maxwell runabout with her husband, Peter Back, to Philadelphia—and back.

This allotment having used up all of the metal prizes the committee had to present, the remaining four contestants are to receive certificates of honorable mention—every one of them. They are: Mrs. Lillian Gillespie, Mrs. J. C. Kirkman, Miss Bertha Rittweger and Mrs. E. F. Gresh.

Associated Clubs of New Jersey Election.

At the annual meeting of the Associated Automobile Clubs of New Jersey, the following officers were elected: President, W. C. Crosby; first vice-president, Walter Edge; second vice-president, Edward H. Radel; secretary and treasurer, H. A. Bonnell. Eight of the associated clubs were represented at the meeting.

REVISED RULES FOR GLIDDEN TOUR

One-Man Control Abolished—Committee to Manage Contest—New Trophy for an Added Class of Contestants.

Chairman Hower is not to enjoy the complete autocracy in the control of the sixth annual reliability touring contest of the American Automobile Association which he has had in the past, it would appear from the preliminary announcement of the rules for the 1909 contest, just announced. Instead of the chairman absolute, there will be a committee absolute, delegated by the new contest board of the association, and the powers of the committee will be practically the same as those which formerly devolved upon the chairman. The dates for the run and the course, remain to be selected.

In addition to the Glidden and Hower trophies and the award of certificates to the entrants of all contesting cars completing the tour, there will be a fourth award in the shape of a trophy for the new class of miniature tonneau and double rumble cars. Competing vehicles will be divided into five groups designated alphabetically, according to price classification. Scoring will be done on a point penalty basis, much as hitherto; repairs, late arrivals at controls and deterioration, as shown by a final examination subsequent to the contest, constituting the basis for demerits. All cars will start with perfect scores, and those finishing with the lowest scores in their classes will receive the awards. The more novel and important provisions of the rules are given in the following summary:

"Each entrant shall be a member of a club affiliated with the American Automobile Association.

"Any stock car consisting of a combination of the manufacturers standard touring car chassis, touring body and standard equipment, with seats for four people or more, and carrying four or more persons or ballast at the rate of 125 pounds per person, may compete for the Glidden trophy.

"Any regular stock chassis with body equipped for two persons on the front seat and with standard equipment, and carrying not less than two persons, may compete for the Hower trophy. The car may have a rumble seat for one or two persons and additional passengers may be carried.

"Any stock car, consisting of a combination of a miniature tonneau with doors, mounted upon the chassis regularly furnished with the same standard equipment, carrying four persons or ballast at the rate of 125 pounds per person, may compete for the.....trophy.

"Cars shall at all times during the tour carry mufflers and mud-guards, and be fully equipped as per manufacturer's catalogue specifications, except that tops and wind shields need not be carried.

"Shock absorbers and spring wrappings may be added before the start as equipment, though not regularly furnished.

"Each entrant shall name an official representative for each of his entries, on or before July 1, 1909, failing which the driver of the car shall be considered the official representative. . . .

"The time for receiving entries shall expire on June 16, 1909, at 12 o'clock, noon, at the office of Frank B. Hower, chairman contest board, at 760 Main street, Buffalo, N. Y. Each entry must be accompanied by the entrance fee. For entries received prior to May 15th the fee shall be $200; after May 15 and utnil 12 o'clock, noon, on June 16th the entrance fee shall be $300. . . .

"Each day's tour shall be preceded by a pacemaker's car; and any entrant or representative thereof who passes the pacemaker shall be disqualified. If the pacemaker's car breaks down or is compelled to travel at a rate so slow as to impede the progress of the tour, his flag shall be transferred to the first car overtaking him, which car shall thereafter become pacemaker's car subject to the same conditions. . . .

"Competing cars shall be divided into classes as follows: Class A—Cars listed at $3,751 and upwards; Class B—Cars listed at $2,451 to $3,750 inclusive; Class C—Cars listed at $1,751 up to $2,450 inclusive; Class D—Cars listed at $1,000 to $1,750 inclusive, and Class E—Cars listed at $999 and under.

"The Class A running time for each day shall be posted on the bulletin board at headquarters the previous evening. Each driver, using this as a basis, shall figure his own running time and when due at controls.

"When the daily running time shall be 9 hours or more, the running time of:

Class B will exceed that of Class A 20 minutes;
Class C will exceed that of Class A 40 minutes;
Class D will exceed that of Class A 60 minutes;
Class E will exceed that of Class A 80 minutes;

"When the daily running time shall be greater than 7½ hours and less than 9 hours the running time of:

Class B will exceed that of Class A 15 minutes;
Class C will exceed that of Class A 30 minutes;
Class D will exceed that of Class A 45 minutes;
Class E will exceed that of Class A 60 minutes;

"When the daily running time shall be 7½ hours or less the running time of:

Class B will exceed that of Class A 10 minutes;
Class C will exceed that of Class A 20 minutes;
Class D will exceed that of Class A 30 minutes;
Class E will exceed that of Class A 40 minutes."

Provision for controls with arrangements for guarding cars at night will be carried out much as in former tours. The morning checking-out time will be 7 o'clock, and the committee may establish such checking points as it may deem proper. A car ahead of time at night controls may immediately check in. As for the provision for the observers, which are to be furnished by the entrants, if the entrant is an automobile manufacturer or dealer, or in any way connected with the manufacture or sale of automobiles, each observer furnished by him shall be:

"A person who has been regularly and exclusively employed by the entrant by whom he is nominated for a period of not less than three months prior to the contest, or the entrant himself or an officer or director of his business, or a dealer in the car made by the entrant; an owner of a car made by the entrant. If the entrant is not an automobile manufacturer or dealer the observer furnished by him shall be satisfactory to the committee. Each observer may be assigned to a different car each day."

The penalty provisions are as follows:

"After an allowance of two minutes, each late arrival will be penalized one point for each minute or part thereof.

"Parts, labor and use of tools shall be penalized as follows:

"Inventoried parts and material carried from the start: One-tenth of a point for each ten cents (10c) or fraction thereof.

"Time consumed by driver and mechanician in work in connection with such parts. One-tenth of a point for each man working for each minute or fraction thereof.

"Outside labor: Two-tenths of a point for each man working for each minute or fraction thereof.

"Parts and material not inventoried and carried from the start: Two-tenths of a point for each ten cents (10c) or fraction thereof.

Time consumed in connection with such uninventoried parts: Two-tenths of a point for each minute or fraction thereof for each person.

For the use by driver or mechanician of tools not listed: Two-tenths of a point for each man for each minute or fraction thereof that such tools are in use. . . .

"Any car which may, for any reason, discontinue as a contestant, shall be penalized 1,000 points in addition to all previous penalizations."

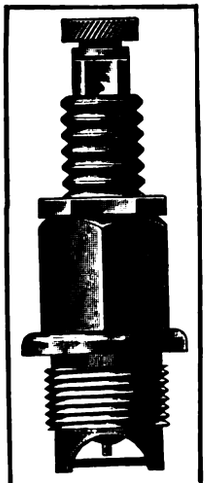
After providing for the possible disqualifications of an owner or driver arrested for speeding. the rules further state that:

"When road conditions are so bad that a car cannot get sufficient traction to move, or is ditched, and reasonable effort has been made to extricate it, towing or other external means may be used to relieve the immediate distress only, but under no circumstances shall a car enter a night or any other control, except under its own power. When towing, or assistance from any external source shall have been received by a car, its observer shall make a full and complete report, giving time, place, conditions, distance of tow, and any other details."

The authority of the committee is constituted thus:

"The committee of the contest board shall manage the tour, with full power to enforce the rules, render decisions and do anything else that would be within the province of the contest board of the American Automobile Association.

"The committee of the contest board reserves the right to alter, amend or suspend these rules from time to time, up to and including the end of the tour and final award, as may be deemed expedient.



"The committee or its representatives shall have power at all times to make such examinations of the cars and their contents as may be deemed advisable.

"The committee shall have power to disqualify any car for traveling at any speed which it may consider excessive under the conditions existing at the time, and without reference to these rules."

Hotel accommodations, as in former years, will be taken care of by an advance tourist agent. But the "baggage train" has been eliminated.

900,792. Transmission Gear. Ernst M. Sternberg, Milwaukee, Wis. Filed Nov. 29, 1907. Serial No. 404.315.

1. In a transmission gear, a power shaft, axially aligned transverse counter shafts disposed on opposite sides of the power shaft, a gear wheel in connection with each counter shaft, a driving gear wheel carried by the power shaft for engagement with the counter shaft gear wheels, an arbor revolubly mounted about one of said counter shafts, a gear wheel secured thereto, and an idle gear wheel engaging the arbor gear wheel and gear wheel of the aforesaid counter shaft about which sair arbor is mounted.

900,798. Sparking Device for Gas Engines and the Like. Fredus A. Thurston, Chicago, Ill. Filed June 15, 1904. Serial No. 212,647.

1. An appartus of the class specified, comprising a ring or annulus made of insulating material, and having a series of contacts on the inner side of its periphery, a rotary member having a spring-actuated contact adapted to travel on the inner surface of said ring, and make connection with said contacts thereon, said rotary member being also provided with a second contact member adapted to make connection with said ring contacts after the making connection therewith, of said spring controlled member, and a connection on the ring extending to said contacts on said rotary member.

900,857. Gearing. Thomas B. Jeffery, Kenosha, Wis. Filed Feb. 23, 1904. Serial No. 194,761.

1. The combination with a pair of aligned shafts, of a rotary power transmission member having hubs surrounding the adjacent ends of the shafts, exteriorly screw-threaded sleeves keyed upon said hubs so as to be movable axially of the hubs and immovable angularly with respect to the hubs, collars having screw threads for engaging the screw threads upon the hubs, the ends of said collars abutting against the sides of said transmission member, circular supports surrounding said hubs, and anti-friction bearings interposed between the ends of said sleeves and said supports.

900,860. Anti-Friction Bearing. Ernest C. Ketchum, Boston, Mass. Filed Aug. 28, 1907. Serial No. 390,479.

1. In a roller bearing, the combination of two rings movable relatively to each other and provided on adjacent circumferential walls with paths for anti-friction members; a plurality of anti-friction members interposed between said rings and adapted to revolve in contact with said paths; a separator between each pair of anti-friction members; and a revoluble member contacting with and interposed between each separator and the outer roller path, the axes of each separator and its co-operating revoluble member being radial to the axis of said roller bearing.

901,006. Apparatus for Curing or Vulcanizing Rubber Goods. Ernest Hopkinson, East Orange, N. J., and Thomas Midgley, Hartford, Conn.; said Hopkinson assignor to the Hartford Rubber Works Company, Hartford, Conn., a Corporation of Connecticut. Filed Dec. 19, 1905. Serial No. 292,-443.

1. The combination in apparatus of the character specified, of a core adapted for

The Warner Auto-Meter

1909 Style

Guaranteed
Absolutely Accurate

is the only speed indicator made on the Magnetic Induction principle. Because of the principle it accurately indicates every range of speed from zero to the maximum.

All other instruments are made on the centrifugal principle. They fail to indicate any speed whatever under 5 to 10 miles per hour.

The Auto-Meter is so durably made that practical tests have shown that it will endure a **MILLION MILES** of riding without perceptible wear, or departing from absolute accuracy more than **10 feet to the mile.**

We invite comparative tests. Before you decide on any Speed Indicator, put the Auto-Meter on one side of your dash and any other indicator at any price on the other. Then use your watch over a measured course. Keep the instrument which **tells the truth.** We know which it will be.

insertion within a tire shoe or casing, means for clamping the margins of the casing in proper relation to the core while leaving the tread of the shoe or casing exposed, and a wrapping or cover extending over the tire shoe or casing and the clamping devices.

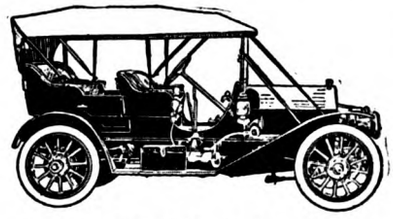
901,007. Method of Curing or Vulcanizing the Outer Shoes or Casings of Pneumatic Tires. Ernest Hopkinson, East Orange, N. J., and Thomas Midgley, Hartford, Conn.; said Hopkinson assignor to The Hartford Rubber Works Company, Hartford, Conn., a Corporation of Connecticut. Filed Dec. 19, 1905. Serial No. 292,444.

1. The method of vulcanizing or curing outside shoes or casings for pneumatic tires for vehicles which consists in supporting the shoe or casing upon a core, placing an abutment member between the margins of the shoe or casing, clamping the shoe or casing firmly upon the core and against the abutment member, but leaving the tread portion of the shoe or casing exposed, placing a covering of textile fabric over the exposed tread portion of the shoe or casing and in contact therewith, and in subjecting the shoe or casing so supported and covered to the action of vulcanizing heat.

901,055. Motor Vehicle. John D. Allen and John A. Conly, Philadelphia, Pa. Filed April 26, 1906. Serial No. 313,776.

1. In a motor vehicle, the combination with the frame thereof and the rear wheels journaled on said frame, of a divided driving shaft for said wheels, comprising a hollow central section having two gears loose thereon, a clutch movable to connect either gear thereto, and clutch members slidably mounted at either end thereof; and two end sections, the reduced inner ends of which are journaled in the ends of said hollow central section, each end section carrying a fixed clutch member co-operating with the corresponding slidable clutch member on the adjacent end of said central section, and means to actuate said slidable clutch members.

901,345. Carburetter. Thomson Howell, Newark, N. J. Filed March 5, 1908. Serial No. 419,318.



1. A carburetter for explosive gas engines comprising a main tubular body provided with an air-intake, and an outlet, a pair of arms extending diametrically across the interior of said main body, one of the said sets of arms being provided with an internally screw-threaded hub, and the other set of said arms having a hub formed with a hole, providing a guide, a tubular gasolene conveyor extending into the mixing chamber of said body and being provided with a screw threaded portion screwed into said screw threaded hub, said conveyer being provided with a plurality of perforations or holes, and a valve seat within said conveyer, a spindle movably arranged in the hole of said one set of arms, said spindle having a portion movably arranged within said conveyor and being provided with a cone-shaped end adapted to normally rest upon said valve seat, and means connected with said spindle adapted to be actuated by suction for removing said one-shaped end from the valve seat and thereby opening one or more of said perforations of the gasolene conveyor.

901,502. Lubricator. Josef Vollmer, Berlin, Germany, assignor to General Electric Company, a Corporation of New York. Filed July 3, 1905. Serial No. 268,020.

1. In a sight feed lubricator, the combination of a sight glass, a support therefor, and a spring pressed holder forming the sole retainer for the glass and adapted by a single movement away from the support to permit the glass to be instantly removed without subjecting it to stress.

PENNSYLVANIA

—you are interested in the highest quality as against the lowest price; if you believe in careful, personally directed workmanship, as against hurried production by thousands; if you appreciate a wearing dependability that forestalls accident, repair and tinkering; then—it will pay to investigate the Pennsylvania.

Touring Car or Baby Tonneau, $3,000.

THE PALMER-SINGER SIX-SIXTY

65 Miles an hour Guaranteed

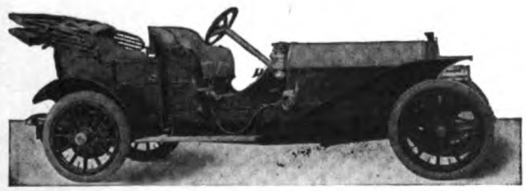
All Cars Sold by Us are Licensed Under Selden Patent and Guaranteed for One Year.

Exhibiting at Madison Square Garden Show

THE PALMER-SINGER SIX-SIXTY gives power and speed in a measure that you cannot be made to appreciate by mere words. WE GUARANTEE 65 MILES AN HOUR ON EVERY ONE OF THESE CARS.

It is the SPORTSMAN'S CAR DE LUUXE and neither in this country nor abroad is there anything of its class and type to compare with it, irrespective of price. It is a six cylinder, 60 H.P. speed car, capable of record-breaking speed and still of carrying from two to five passengers with perfect comfort on long and hard runs.

Nickel steel is used to give lightness and strength. Imported F. & S. ball bearings exclusively. Bosch high tension magneto and multiple disc clutches. Drop forged I beam, front axle—four-speed selective type, sliding gear transmission with direct drive on third speed. All brakes equalized, all expanding type and on rear wheels. Universal joints on all steering connections. Shaft driven, all moving parts inclosed in dustproof cases.



Palmer & Singer Mfg. Co.

1620-22-24 Broadway, New York.

INTER-STATE TOURING CAR, $1,750.

The Inter-State

THE INTER-STATE is a new car, but its designers and builders are **not** new. It is a car of proven worth in every detail—representing the **highest known superiority** in automobile design and construction. If there were any way to make a **better** car we would make the INTER-STATE THAT WAY.

Every part of the INTER-STATE is there for good reason—best service. One of the many superior features of the INTER-STATE is the transmission system and the method of its hanging.

The transmission proper is the three-speed selective type and reverse, with vanadium steel gears. We build the selective mechanism inside the transmission case, insuring thorough and constant lubrication, and combine the clutch (disc) and transmission in the same case—the clutch being in a separate compartment—all mounted rigidly on the end of the torsion tube. The weight of the transmission and the driving force of the rear axle are taken on a large ball and socket joint supported from a rigid cross-bar mounted on the frame just back of the motor. The transmission, the rear axle and foot levers are complete as a unit before being installed. We unite the gear shifting mechanism to the hand levers by our own patented device, which gives absolute reliability under all conditions.

This system of combining the transmission and the clutch gives us the simplest and best three-speed selective type car made, **with greatest durability.**

The same high standard of service quality is maintained throughout the INTER-STATE. It is a **permanent enduring** car at a price but little higher than the price of **temporary** cars. The INTER-STATE complete—with Eisemann Magneto—at **$1,750** is the biggest value on the 1909 market. We want you to see this car before you think of spending your money for a **cheap** car, or even for a higher priced car.

At the Chicago Show— The full line of INTER-STATE automobiles—including Standard Touring Car, Demi-Tonneau, Double Rumble Roadster, Single Rumble Roadster, and Tourabout—will be exhibited at the Coliseum, Chicago, February 6-13.

Dealers and agents will appreciate the opportunities opened to them by the INTER-STATE. Write for our proposition.

The Inter-State Automobile Co.

126 Willard St., **Muncie, Ind.**

GABRIEL 1909

In order to maintain the high standard which the products of our factory have acquired, many improvements have been made in the 1909 models of The Gabriel Horn, The Gabriel Shock-Absorber and The Gabriel Cut-Out Valve. Gabriel Products still set the pace which competing lines try to follow.

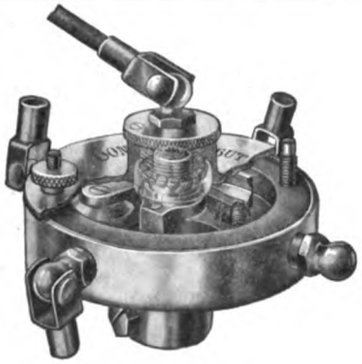
A Polite Request

The rich mellow notes of THE GABRIEL HORN act as a polite request, not a harsh demand. It warns without frightening. By a new device its sweet, musical three note tone used for city purposes can be caused to rise in unison for a penetrating warning on country roads. The Gabriel Horn is used exclusively on the personal cars of King Edward of England, Emperor William of Germany, and other crowned heads of Europe.

1909 Gabriel Horn and Cut-Out Valve

We have perfected a new valve which is used both for operating exhaust horn and for cut-out purposes. For cut-out purposes, remove the disc in main channel thereby relieving back pressure from muffler through additional opening of 1¼ inches. Made to fit exhaust pipes 1" to 2½" outside diameter. Warranted to not stick under any condition.

Going Up



is pleasant enough, but coming down with a thud is what makes the nerves quiver and cry for

1909 Gabriel Shock Absorbers

A retarding friction gradually applied in proportion to the shock takes up all jolts and jars, and makes riding over rough roads or bumpy pavements a positive pleasure. The 1909 Model has improvements which give increased bearing surface, eliminate noise or rattle and greatly increase its efficiency and durability. Thermoid used for friction pad. Can be attached to any car or any type of spring. Write for booklet illustrating and describing our 1909 products.

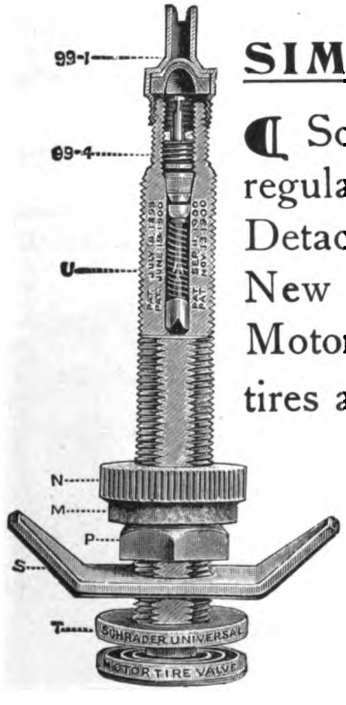
The Magneto That Starts Itself

PAYING THE PRICE

To the average motorist of experience a magneto is chiefly desirable because it eliminates the troubles associated with the ordinary battery and coil system.. He can run all day for weeks together without having to think about battery depreciation, timer wear, or readjustment of the tremblers.

But with magnetos of the ordinary types, he has to pay for this immunity in physical effort every time he starts the engine. When he halts for a few minutes he probably pays for it in gasoline sooner than trouble to stop the engine and restart. If he would start easily, he must pay the price of a battery equipment in addition to the magneto.

With the UNTERBERG & HELMLE SELF-STARTING MAGNETO no battery equipment is needed or carried, yet the largest engine starts on the first half turn of the crank as easily as the smallest. The self-starting device gives a spark of maximum intensity, automatically retarded for safety past the center, no matter how slowly the starting crank is turned. It is the complete solution of the starting problem for magnetos.



Type LE—The SELF-STARTING MAGNETO. Price $150
Type LB—Similar to LE, but without the starting device. Price.... 125
Type CB-4—For motors up to 35 h.p. Price..... 100

Stearns

GOOD design; a careful selection of scientifically tested materials; the exercise of greatest care in the manufacture of component parts; painstaking skill in their assembly, and a system of final inspection so comprehensive and complete that anything under 100 per cent. perfect cannot get through—that's Stearns production.

¶ Our new 15-30 is for those who would have a strictly high quality car at price and of power somewhat under the 30-60 horsepower model.

¶ Catalogued at 15-30 it develops close to 40 horsepower and, while of comparative light weight, is so staunch and sturdy that it will "stand up," as a good car should, even under unusual conditions of service.

¶ And, like our 30-60 (which is accepted as the standard of excellence in America), this new 15-30 model represents extreme high quality in every line and fiber.

¶ It is shaft drive, and designed to accommodate town and touring bodies.

¶ In our 30-60 horsepower model purchasers are given side chain or shaft drive option.

¶ Demonstration by appointment.

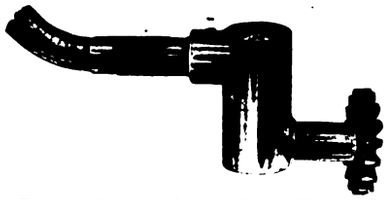
Everybody Concedes

Where the Famous Stewart Flexible Shaft is Made.



The Stewart Speedometers

Have the habit of sticking to the car and doing business at the highest speeds.

Stronger clamps, bigger screws and our patent swivel joint, which takes all the strain off the shaft, are some of the reasons.

A stronger and better flexible shaft helps also.

We have been the largest makers of flexible shafts for 20 years. Working all our bearing parts out of the solid instead of soldering makes a big difference.

The Famous Stewart Swivel Joint (Patented)

Main Office and Factory.

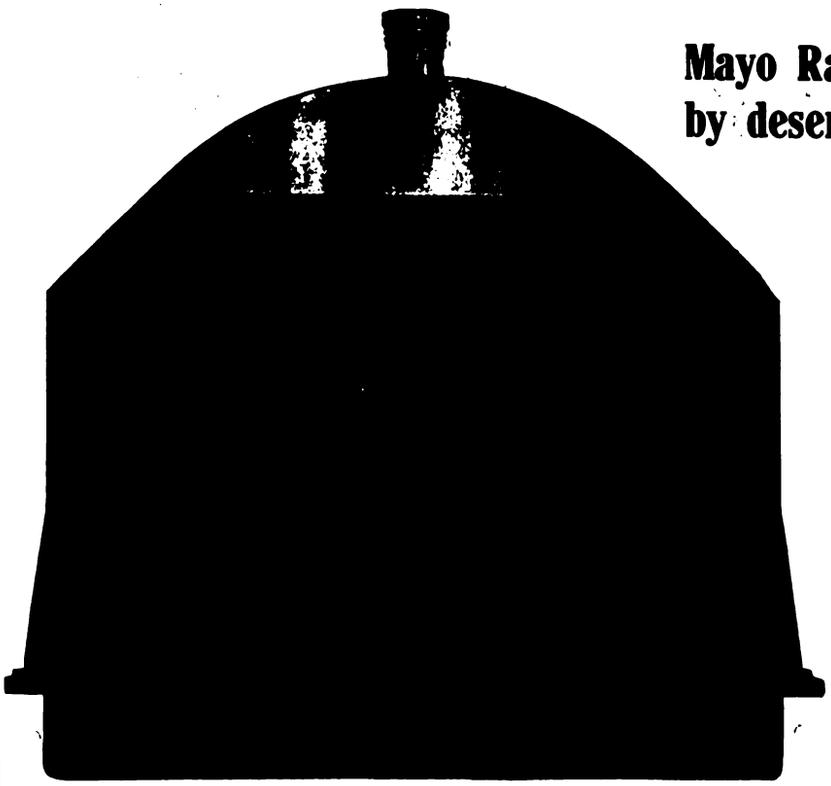
Stewart Speedometers

are made to sell on their merits. We have built up the largest speedometer business in the world by making instruments that are intrinsically superior to any other to be had at any price.

A patented cam corrects readings at all speeds, a patented swivel joint at the wheel connection relieves the fexible shaft of short bends and all strain.

THESE FEATURES ARE EXCLUSIVE OF THE

Stewart Speedometer



MODEL 4—Four-inch, 60-mile dial, enclosed season odometer and automatic resetting trip register and maximum speed hand, price **$40**

'Tis not in mortals to command success, but we'll do more--deserve it.

Mayo Radiators have achieved success by deserving it, and in no other way.

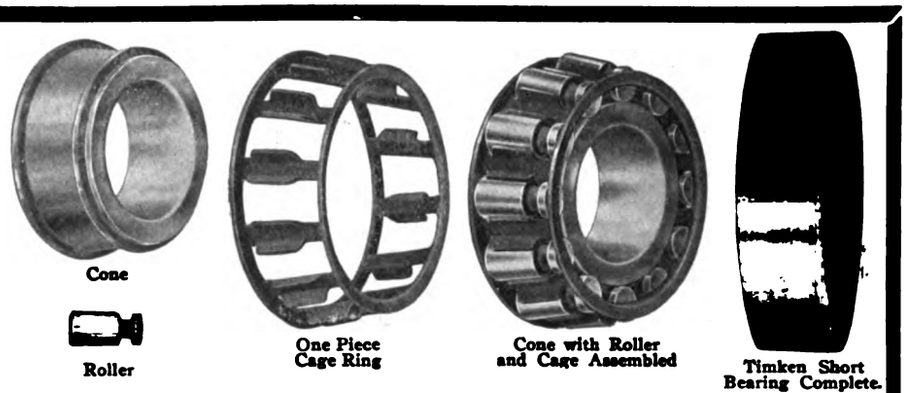
¶ Therefore that success is presumably of the permanent and abiding kind.

¶ Price is the cause of the absence of MAYO RADIATORS from cheap cars.

¶ Quality is the reason for the presence of MAYO RADIATORS on most of the good cars.

¶ The only argument against MAYO RADIATORS is their price.

¶ Every other consideration dictates their use.



¶ MAYO RADIATORS combine sound mechanical principles, exact design, construction and workmanship, together with graceful appearance and perfect finish; in short, all the good qualities that go to make the ideal radiator.

¶ MAYO RADIATORS are stamped with the hallmark of class.

¶ MAYO RADIATORS are really the thoroughbreds of the radiator world.

¶ MAYO RADIATORS are made in the kind of a factory that befits them and by the MAYO RADIATOR COMPANY, at New Haven, Connecticut.

New Series TIMKEN Short Bearings

In offering the Automobile trade our **New Series Timken Short Bearings,** we do so with the assurance that they are made from the same carefully selected steel and subjected to the same severe tests as our standard size Bearings.

The **New Series Short Bearings** are designed for use in axles where the bearings space does not permit the use of our regular series.

These Short Bearings can be used on any axle, transmission, or other places where Annular Bearings can be used. They carry **a much greater load** than Annular Bearings of the same length, **are smaller in diameter** and in addition will take as much **end thrust** as they do **radial load.**

Every bar of steel entering into **Timken** Products is made to the **Timken** analysis chemically—and tested to the **Timken** test physically—which means a rejection of **45 per cent.** of every ingot before metal of suitable density and soundness for **Timken** Roller Bearings can be obtained. These new Short Bearing Rollers are made from best nickel steel.

This is one reason why **65 per cent.** of the makers of high-grade Automobiles and over **90 per cent.** of the commercial truck builders of this country use **Timken** Roller Bearings. **WRITE FOR CATALOG AND PRICES**

THE SELDEN CAR

MADE BY

"The Father of Them All"

One Price, $2,000. F. O. B. Rochester.

TOURING CAR, ROADSTER, TOY TONNEAU

A genuinely good car cannot be made and sold for less than $2,000. By this we mean a car like the Selden, containing nothing but the best of materials, workmanship and finish. A car that the manufacturer can stand behind and guarantee for at least a year against any imperfections in workmanship or material.

We buy only the best materials, employ only skilled labor and pay particular attention to details and finish, thereby producing a strictly high-grade car at the lowest possible price.

The up-keep and maintenance of a medium-priced car like the Selden is within the reach of any man of moderate means and the value of the car does not depreciate like that of the lower priced cars. This is the point to be considered by every purchaser.

The Selden Car is a 4-cylinder 28-30 horsepower (developing 37 horsepower) five passenger Touring Car or three passenger Roadster, with 114-inch wheel base, 34-inch wheels, shaft drive, selective control, pressed steel frame, metal body, fully equipped.

Superb riding, roomy tonneau, luxurious upholstery, smooth running, great hill-climber, flexible and easily handled, economical in maintenance and up-keep, fine finish, stylish and attractive.

THE COMING CAR OF MODERATE PRICE

Catalog and Agency proposition upon request. Agencies wanted everywhere.

THE MARMON

"A Mechanical Masterpiece"

Marmon "Thirty-Two"
$2400

Value, Not Venture

The marked mechanical perfection, the unusual durability, and the thorough dependability of Marmon cars have never been questioned by well-informed, experienced motorists.

For over fifty years, its manufacturers have enjoyed a world-wide reputation as builders of high-grade mechanical products.

These facts will weigh heavily with the thoughtful buyer in considering the Marmon "Thirty-two." Light, powerful, and unsparingly equipped, it invites the most searching comparison with anything on wheels at $3,500 or less.

Motor, 4 Cyl. 4½x4½. Water-cooled. 32-40 H. P. Three-point support. **Ignition,** Bosch H. T. Magneto, dual system. **Lubrication,** Marmon system of automatic force feed through hollow crankshaft. **Drive,** straight line shaft. Selective transmission and rear axle one compact unit, very accessible. Large brakes, effective and very durable. **Materials,** absolutely the best of everything, including Krupp and Chrome Nickel Steels. Hess-Bright imported ball bearings. **Tires,** Q. D.,34x4. **Wheel base,** 112 in. **Weight,** 2100 lbs. **Equipment,** complete and high-class. **Bodies,** Sheet Metal. Touring Car seats five; Suburban (detachable tonneau) seats four; Roadster seats two. Also Coupe or Limousine Town Car.

Marmon "Fifty" (Seven Passengers), $3,750.

The Easiest Riding Car In The World

THE MEASURE OF TIRE QUALITY

is not alone Length of Service but also Kind of Service

A tire that has to be coaxed by frequent visits to a repair shop is an inferior tire, even tho it may last a total of three, five or seven thousand miles.

MORGAN & WRIGHT TIRES

are long-lived tires, but the length of service is secured in the making of the tires and not by frequent doctoring by the users. They stand up as only tires can that are made as Morgan & Wright Tires are. And our rigid system of inspection protects you from any and all possible defects.

Morgan & Wright, Detroit

Proclamation!

TO TRUCK OWNERS EVERYWHERE

THREE years ago when we applied the first Dual Side-Wire tire in America, we believed that we were introducing the newest and best thing obtainable in the shape of a MOTOR TIRE. And we were—the best thing up to that time. But times change; and we pride ourselves on trying to keep abreast of them. Careful study and observation of the solid tire situation abroad, have firmly convinced us that the side wire tire is now a back number and must graciously step aside for the newer and better product.

WE accordingly beg to announce that we are now manufacturing a NEW tire, which for service, security and resiliency, completely eclipses the side wire type. It is the

Gibney Wireless Motor Tire

CROSS SECTION—DUAL TYPE

THIS is not an untried experiment. These tires have been the standard of Continental Europe for the past five years. They have triumphed abroad; they will make good here.

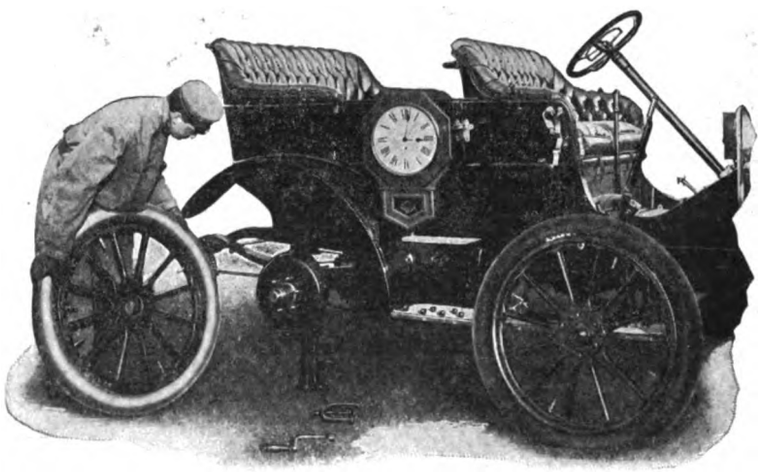
Model Forty-Four, 34 H. P. $2250.

THE RAMBLER SPARE WHEEL



All the new four-cylinder Ramblers are fitted for the Rambler Spare Wheel—a wheel complete—excepting the hub center, on which is carried a complete tire inflated. The regular wheel is secured to the hub center by six bolts. Removing the six nuts for these bolts this wheel can be detached in two minutes with the special tools provided, and the Spare Wheel put on and secured in three minutes.

Wheel fits either front or rear. Solves the tire problem. Extra wheel available in case of need. Spare Wheel with inflated tire, brackets and tools, for Model Forty-Four, $74, for Model Forty-Five, $85.

Rambler

The Car with the Offset Crank Shaft

Seven passenger model, forty-five horse power with offset crank shaft, $2500. Other models, $1150 to $2500.

Write for catalog describing in detail Rambler offset crank shaft, Spare Wheel, straight line drive and other exclusive features of the new Rambler models.

This shows the simple manner in which the regular wheel can be removed and the Spare Wheel substituted within three minutes.

THE MOTOR WORLD

Volume XIX. New York, U. S. A., Thursday, January 28, 1909. No. 18

TIMKEN FORMS DETROIT COMPANY

Separate Corporation for the Huge Axle Making Project—Lewis to Manage the New Plant.

The location in Detroit, Mich., of a Timkin factory for the manufacture of automobile axles, as announced exclusively in the Motor World recently, is accompanied by the formation of a new company, to be called the Timken-Detroit Axle Co., incorporated under Michigan laws with a paid-in capital of $650,000. Inasmuch as the Detroit plant is to be the largest automobile axle factory in the world, with an annual capacity of not less than 25,000 axle sets per year, the new company was determined upon as the most satisfactory way of managing it, but it is closely affiliated with the Timken Roller Bearing Axle Co, of Canton, O., and comes into possession of all the patent rights, experience and good will of the latter.

So close is the relationship that all of the stock of the new concern is held by E. W. Lewis, secretary of the Canton company; A. R. Demery, its superintendent; H. W. Alden, mechanical engineer and designer; and H. H. and W. R. Timken. The general manager and active head at the axle plant will be Lewis, who with Demery and Alden, will move to Detroit, while H. H. and W. R. Timken will manage the Canton plant, which will hereafter be devoted entirely to the production of Timken bearings and which, through the removal of the axle manufacture, will be enabled to increase its output to meet the constantly enlarging demand.

By no means the least interesting feature of the new undertaking, which will add much to Detroit's prestige as an automobile industrial center, is the great confidence which the men at its head entertain as to the future magnitude of the motor car industry. Supplying so large a proportion of the prominent automobile factories with the Timken products, they are able accurately to judge conditions in the trade and forecast its future, and the hugeness of their present undertaking is a symbol of the certainty with which they regard the continued increased activity of automobile production.

Fitch Making Automobiles in Rome.

Backed by members of the Fitch Gear Co., a new automobile manufacturing concern is starting operations in Rome, N. Y., to make runabouts, touring cars and delivery wagons of both the high wheel and low wheel types. It has not as yet been named or incorporated, but sample cars are being produced at the Fitch Gear factory while the finishing and sales departments are located at the plant of the Maxwell-Fitch Co., in West Dominick street.

Tempting Salina with a Factory.

If Salina, Kan., will raise $40,000 cash and buy stock in a new automobile company which has been incorporated in Topeka, the company will look with such favor on Salina that it will locate its plant there. The glittering offer comes from Kelly & Kelly, of Topeka, brokers of which H. B. Kelly, ex-state senator, is the head. He says that the company is being organized with $125,000 capital.

Jones Handles Mezger Products.

The products of C. A. Mezger, Inc., of New York, including Soot Proof spark plugs and Automatic wind shields, will in the future be handled by The Jones Speedometer, New York, which has undertaken their sale and general distribution throughout the country. Complete stocks will be carried at the Jones branches in Boston, Philadelphia, Baltimore, Cleveland and Chicago.

Takes New York Coil Sales.

In addition to its other lines, the Factory Sales Corporation, of Chicago, has taken the product of the New York Coil Co. The latter company makes both high and low tension coils, including a multiple coil with master vibrator for magneto service.

SCARRITT BACKS A CAB PROJECT

Generously Capitalized Jersey Corporation to Invade the Metropolis—Will Absorb Small Operators.

Taximeter cab competition in New York City, which promises to develop to fever heat, is promised further enlivenment by the formation of a $2,200,000 concern in which Winthrop E. Scarritt, one time president of the Automobile Club of America, and Harlan W. Whipple, former president of the American Automobile Association, are the moving spirits. It has been incorporated as the Taxicab Service Co, under the laws of New Jersey, but its chief activities will be in Manhattan, where one or two of the smaller motor cab companies now operating will be absorbed. The stock is divided into $1,000,000 preferred 7 per cent. cumulative and $1,200,000 common.

Taking over the business of the company now operating from the Waldorf and the Holland House, together with its vehicles, the new company will enlarge its equipment by extensive purchases of more cabs of the same type, made by the American Locomotive Works, of Providence, R. I. An effort will be made to popularize the cabs in the lower downtown district, below Fourteenth street, where taximeter service so far has been scarce.

Atlanta Has a Motor Car Plant.

Automobile manufacture in Atlanta, Ga., is to be pioneered by the White Star Automobile Co., capitalized at $150,000 and backed by Clarence Houston, of the Atlanta Buggy Co., together with Harry W. Anderson, Frank J. Long, Dr. S W. Foster, Hugh R. Fischer and others. The company has already made its first machine, which has been in operation since last September, and a complete floor of the buggy company's large new plant, at Ponder's avenue and Means street, will be used for the concern's manufacturing operations

In the Retail World.

O. A. Burd & Son have opened a large and well equipped garage at Lambertville, N. J. The repair shop is in hands of competent mechanics and a full line of accessories will be carried.

The Tennessee Automobile Co., of Nashville, Tenn., began business this month on Broadway near Twelfth street. J. J. Vertress, Jr., is president and James K. Polk, Jr., secretary and treasurer.

The D. P. McClure Garage, Second and Green streets, Ottumwa, Ia., has been purchased by M. A. Stuil, formerly with the Stearns Auto Co. In addition to having the agency for several cars, he will carry a full line of accessories.

Wilson H. Stoyle and Lewis G. Vogel, doing business as the Stoyle Automobile Co., of Philadelphia, Pa., have taken an automobile salesroom at the southeast corner of Broad and Race streets. Their establishment at 1521 Spring street will be retained as a storehouse and garage.

E. G. Mertens, formerly a traveling salesman for the Electric Vehicle Co., Hartford, Conn., has purchased an interest in the Glens Falls Automobile Co., of Glens Falls, N. Y., and was elected its vice-president at a recent meeting. The concern has the agency for the Thomas, Cadillac and Pope-Hartford lines.

Reduction of Goggle Duty Refused.

Repeated recent efforts to import automobile goggles at a rate lower than the 50 per cent. imposed on "goggles" by the Dingley tariff, have met with failure, the importers suffering another defeat in the latest decision on this subject by the board of United States general appraisers, at New York. The attempted differentiation of "autogoggles" from mere pedestrians' "goggles" having been altogether too fine for the appraisers to discover, the importers have taken the ground that the motor goggles should be returned for duty at 45 per cent. either as "lenses" or as being composed in chief value of metal. In overruling protests filed by Saks & Co., and by Sussfield, Lorsch & Co., neither of these contentions is upheld by General Appraiser Sharretts, the decision remarking that the use to which the goggles are put is identical whether they are worn by automobilists or others.

Riker Attacked by Laryngitis.

A. L. Riker, designer for the Locomobile Co. of America, is ill at his home in Bridgeport, Conn., with a severe attack of laryngitis contracted at the Garden show in New York. Although confined to his bed, his physician expects his complete recovery in two weeks.

Robbins to Represent Oakland.

Oakland cars are to have adequate representation in Chicago through the establishment of a branch in that city by the Centaur Motor Co., of Buffalo, general selling agents for the Oakland Motor Car Co., Pontiac, Mich. The branch, which will occupy the building formerly used by the Rainier Co., at 1725 Michigan avenue, will be in charge of Arthur M. Robbins formerly with the Aerocar Co., and more recently with the Rainier in the Windy City.

Los Angeles Branch for Firestone.

To distribute Firestone tires for southern California, a new, direct branch of the Firestone Tire & Rubber Co., Akron, O., has been established at 957 South Main street, Los Angeles. The management is in the hands of G. C. Calbetzor, formerly Pacific Coast manager, and also Frank R. Talbott, who has resigned as assistant treasurer and leaves the home office at Akron this week to assume his new position.

John Gets Inter-State Territory.

Geo. C. John, manager of the New York City branch of the St. Louis Car Co., has obtained the agency for the Inter-State cars in New York, New Jersey and Connecticut. The machines are the product of the Inter-State Automobile Co., of Muncie, Ind., which has sprung into recent prominence, as a result of the active campaign undertaken by Sales Manager David W. Henry.

Lynch to Make Continental Tests.

A new department of tests has been inaugurated by the Continental Caoutchouc Co., of New York. It will be in charge of Tom Lynch, who will devote his time to testing each type of Continental tire in actual road work of from 150 to 200 miles per days.

Manchester Has a Motor Car Fire.

Fire at the Sullivan Automobile Garage on Myrtle street, Manchester, N. H., on Wednesday, 27th inst., caused a loss on cars estimated at $40,000. The conflagration was caused by the falling and breaking of a lamp.

Van Sicklen is Knox Chicago Manager.

N. H. Van Sicklen, formerly publisher of the Chicago moiety of the Siamese twins, has undertaken the opening of a Chicago branch for the Knox. He will take over the business of the present agent, J. H. McCausland, at 1458 Michigan avenue.

Richert to Push Allen-Kingston.

Ben Richert, well known in New York City trade circles, has undertaken the sale of the Allen-Kingston line, with headquarters at No. 3 West Forty-fourth street. The Allen-Kingston cars are made by the Bristol Engineering Co., of Bristol, Conn.

Whitlock Returns to Empire.

W. G. Whitlock, who resigned some time ago from the Empire Automobile Tire Co., Trenton, N. J., has resumed his old connection. He will again represent the company in the sales department.

The Week's Incorporations.

Clintonville, Wis.—Badger Four-Wheel Drive Auto Co., The, under Wisconsin laws, with $50,000; to manufacture automobiles.

Chicago, Ill.—Velie Motor Vehicle Sales Agency, under Illinois laws, with $25,000 capital. Corporators—W. L. Velie, Harry M. Moore and O. E. Mansur.

Syracuse, N. Y.—Taxicab Garage Co., under New York laws, with $25,000 capital; to operate cabs. Corporators—H. L. Conde, L. Conde, J. H. Walrath, Syracuse.

Council Bluffs, Ia.—Sperling & Triplett Co., under Iowa laws, with $10,000 capital; to deal in automobiles. Corporators—Henry Sperling and B. P. Triplett.

New York City, N. Y.—Taxicab Service Co., The, under New Jersey laws, with $2,200,000 capital; to operate taximeter cabs. Corporators—Winthrop E. Scarritt, Henry K. Picking and James Mapletoft.

Buffalo, N. Y.—Pierce-Arrow Motor Car Co., The, under New York laws, with $1,500,000 capital; to manufacture motor cars (succeeding the George N. Pierce Co.). Corporators—G. K. Birge, H. May, C. Clifton, W. H. Gardner, W. B. Hoyt, Buffalo.

Johnson Serves Second Injunction.

Persisting in its endeavors to have the municipality of Milwaukee make its automobile bidding open to as many manufacturers as possible, the Johnson Service Co., of that city, has obtained a second injunction forbidding the board of public works from accepting bids under the new set of specifications which it drew. It is alleged in the supplemental complaint that following the serving of the first injunction, the board advertised for bids for an automobile under specifications that exactly describe one well known make of machine and that it would be impossible for anyone but the manufacturer of that machine to comply with the specifications with the 45-day delivery date required.

Motor Buses for Washington

Despite the failure of its "automobile street cars" several years ago, Washington, D. C., is to have a line of motor buses, to replace the antiquated herdics which the Metropolitan Coach Co. operates on Sixteenth street. Five machines, representing three prominent makes, are being tried out. A three or four minute schedule will later be put in force, and with a five cent fare passengers will be given transfer privileges to and from the lines of the Washington Railway & Electric Co.

Bowman, of Boston, Burned Out.

The J. W. Bowman Co., Boston agency for the Stevens-Duryea, was burned out Tuesday, 26th inst., by a fire which destroyed the four story brick building at 911 Boylston street. About $30,000 worth of the company's cars on the ground floor and in the basement were saved only by quick and heroic action

ASSEMBLING IS NOT MANUFACTURE

So Declares Recent Ruling on New British Patent Law—Complete Local Production Held to be Essential.

Methods of meeting the requirements of Great Britain's new and stringent patent law have been devised with a view to relieving American holders of British patents from the necessity of establishing complete factories for their patented articles in the British borders, but a recent decision appears to make them unavailing. Many legal advisors in the United States have held that, because in most cases the parts of a patented construction are not covered by patent but only the mechanical combination as a whole, it will be sufficient to manufacture the parts in America and have them assembled in Great Britain, in order to meet the requirement that British patents be "adequately worked" in Great Britain to avoid annullment. This contention, according to the British-American Co., of Coventry, England, "has been knocked on the head" by the British courts.

"By a decision just given—the second decision under the new act—an American's patent, No. 26519 of 1906, on a lockstitch machine, has been revoked," the English company explains to its American correspondents, in suggesting the city of Coventry as a locality where American firms may find factories and skilled labor. "In this machine most of the parts entering into its composition were manufactured in the United States and imported, and together with some parts manufactured here, were assembled for sale. The Comptroller General ruled that the American patentees had not 'adequately worked' their patent in England by merely making a small number of substituted parts. It seems to us, therefore, that assembly here will not serve to protect the rights of American patent owners, and that nothing short of complete manufacture on this side will suffice."

Details of New Pope Incorporation.

The new Pope Manufacturing Company has filed with the Connecticut state secretary a certificate of organization. The amount of capital with which the company was authorized to commence business, $3,000, has been paid in in cash. Of the preferred stock, 25,000 shares of the aggregate par value of $2,500,000 have been issued and 40,000 shares of the common stock of the aggregate par value of $4,000,000 The certificate states that the amount paid thereon in cash is $3,000 and in property other than cash, $6,497,000. Harry Bronner, Frederick H. Ecker and August Heckscher of New York hold seven shares of the common stock each, and the following hold one share each of the common stock: Milton Ferguson, Albert Stickney and Henry V. Poor of New York, Albert L. Pope, George Pope, Charles E. Walker and Wilbur C. Walker of Hartford, Arthur W. Pope of Boston and Lewis H. Freedman of New York, and 39,970 shares of the common stock are held by Harry Bronner, Frederick H. Ecker and August Heckscher, as the reorganization committee of the Pope Manufacturing Company, which also holds the 25,000 shares of the preferred stock.

How the Palace Show Melon Cuts up.

Such were the profits of the American Motor Car Manufacturers' Association show at the Grand Central Palace, New York, that the Importers Salon and the Motor and Accessory Manufacturers, which shared in the fortunes of the affair, are to receive a return from the show of 67 per cent. of the amount paid for space. At a full meeting of the A. M. C. M. A. committee of management, held at the New York headquarters on the 21st inst., the show committee made its report which proved the Palace event to have been a record breaker both in attendance and sales. The show committee, consisting of H. G. Smith, chairman; S. H. Mora, R. M. Owen, Benjamin Briscoe, E. R. Hollander, D J. Post and Alfred Reeves, general manager, was extended a formal vote of thanks for its management of the exhibition. At the same meeting a standard form of warranty was adopted, and matters concerning good roads and routine affairs were acted upon. It was announced that the annual meeting of the A. M. C. M. A. will be held in Chicago, on Tuesday, February 9.

Motor and Accessory Officers Chosen.

At the meeting of the board of directors of the Motor and Accessory Manufacturers, held at the Waldorf-Astoria, New York, on the 21st inst., officers for the association were chosen as follows: President, H. E. Raymond, B. F. Goodrich Co., Akron, O.; first vice-president, H. T. Dunn, Fisk Rubber Co., Chicopee Falls, Mass.; second vice-president, F. E. Castle, Atwood-Castle Co., Amesbury, Mass.; third vice-president, C. E. Whitney, Whitney Mfg. Co., Hartford, Conn.; treasurer, W. S. Gorton, Standard Welding Co., Cleveland, O.; secretary, P. S. Steenstrup, Hyatt Roller Bearing Co., Newark, N. J.

Importers' Stockholders Elect Officers.

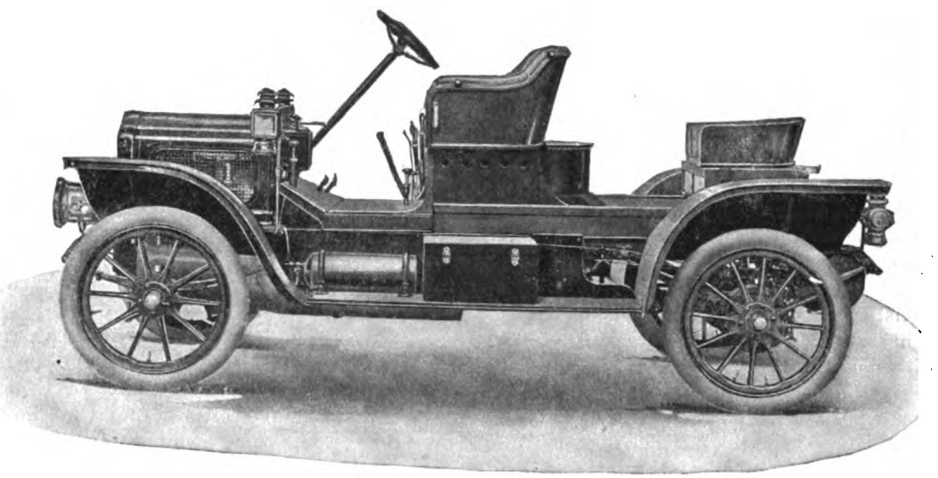
The annual stockholders' meeting and election of the Importers Automobile Salon was held at the association's offices in New York on the 21st inst., and resulted in the choice of W. H. Barnard, the vice-president of last year, as the president to succeed Andre Massenat, C. Allen succeeds himself as treasurer, while E. Rand Hollander was chosen secretary. The board of electors for the coming year consists of Andre Massenat, Harry Fosdick, C. Andrade, Jr., and Julien Block. The general manager of the Salon will be Walter H. Lee, as heretofore.

HARVESTING OF THE GARDEN SHOW

Results as Seen in the Effect Upon the Business of Exhibitors—Total Attendance Reported as 110,000.

For newspaper consumption the representatives of exhibitors at the big automobile shows have in the past taken great latitude in their estimates of the sales, to a point where the joke of the makers selling their "entire output for the year" first at New York, later at Chicago and again at Boston, grew to grinning proportions, but the results of the Licensed show at Madison Square Garden more than confirm the evidence of the Palace show which preceded it, as to the healthy conditions existing in the relations of the automobile industry with the public. Far from absolute correctness as the newspaper estimate of $7,139,000 in business done at the Garden may be, it is certain that the actual business received by both car and accessory exhibitors was in the majority of instances very much greater than was anticipated, according to a confidential canvass.

While a few of the makers are doubtful whether the show increased their business in proportion to the cost of exhibiting, the greater number were able to give evidence of surprisingly large lists of retail sales, not to mention the agency business closed. There were disappointed accessory exhibitors, too, but here again the larger portion of the accessory people received an almost unprecedented volume of both retail and agents' business.



Colonel George Pope, chairman of the show committee of the Association of Licensed Automobile Manufacturers in summing up the results of the show declared the attendance to have exceeded 110,000 for the week, and that because of the fact that most of the exhibiting makers had already concluded their agency arrangements, the retail buyer and user was predominant.

In the opinion of several of the better known car exhibitors, who enjoyed a larger retail sale than at any previous show, an excellent state of general business is indicated by the freedom in retail buying, being a reflection of prosperity restored Incidentally it is said that the work of the salesmen was made much easier this year by the improved average of technical knowledge on the part of the buying public.

When the show week had well advanced, members of the trade were busy in discussing the almost unexpected immensity of the coming season's automobile activity as promised by the evidence. In this connection H. S. Firestone, of the Firestone Tire & Rubber Co., Akron, O., estimated the 1909 American production of cars at 72,500, an estimate based on his knowledge of the number of tires for which the automobile manufacturers are contracting.

Write for the New White Catalog

We have recently issued our complete 1909 catalog. In it are shown the full line of the new Model "M" and Model "O" cars—touring cars, runabouts, town cars, limousines and landaulets.

We have given considerable space to an explanation of the advantages of the White Steamer, as compared with cars of other types, and we believe that this section will prove especially interesting and valuable to those who are contemplating the purchase of any make of automobile.

The catalog includes a full illustrated description of the construction of the White, with especial attention given to the engine—the simplest used in any automobile, and to the generator—the White steam-making device which is as different from the ordinary boiler as day is from night. You should read this section carefully if for no other reason than that you may be well informed regarding the construction of "The only car of distinctively American design."

A postal to us will bring a copy.

Trade Government of "Sport."

Mr. W. H. Hurlburt, himself in the trade, is quoted as saying that the only thing manufacturers and tradesmen generally should have to do with sport is nominating entries for the various forms of competition, or in other words, the trade should have nothing whatsoever to do with its government. Assuming that the quotation is correct, Mr. Hurlburt deserves credit for stating all of a very large truth in a very few words and in striking the nail squarely and exactly on the head.

When trade enters into sport it ceases to be sport and becomes business and as it is an artificial adjunct of business, when the trade abandons it—as ultimately comes to pass—no sport remains. This, as the Motor World many times has pointed out, is the chief trouble with automobile sport.

The private owner—the amateur who is the foundation and real life of all sports—has been sacrificed, so to speak, on the altar of mammon. Because of the overwhelming domination of trade influence in the race-governing project recently undertaken in New York, we fear the situation will be little improved, if at all, this is to say, we fear we will continue to have competition not as a sport, but as a business and apparently conducted more like a business than ever before.

The Motor World does not lack sympathy for the project in question. Since the American Automobile Association declined to play a man's part and practically threw to the dogs a branch of the sport which it deemed too dangerous or too unladylike to be longer handled, it is plain that a governing hand of some sort is necessary to prevent the dogs from swallowing the cast-off and to assure the public at least the semblance of a square deal.

But to be the unpress-agented success it should be, the project must have as its rulers not tradesmen or men with selfish interests to serve, but men free and disinterested and whose only interests are the good of the sport. It matters not who they may be or how honorable or how unselfish they may be at heart and in spirit or even in performance, the fact remains that no men in the trade—no men engaged in sport for business reasons, ever can hope to be wholly above suspicion of self-interest. Those who know them may be well aware of the real truth, but the world is wide and peopled with many and divers orders of mankind.

Business Bringing Garage Details.

Garage equipment is a matter which would appear to require but a comparatively small outlay, either of cash or brain, outside such details as relate to the equipment of the repair shop and provisions for the safe keeping and handling of gasolene and other inflammables. At the same time, the sharp rivalry which exists in all cities and in many small towns between the proprietors of neighboring establishments of the sort makes it imperative that efforts should be made to cater to the patron in every possible way. On this account a good deal of thought may be given profitably to matters connected with the installation of such devices as cater to the convenient and expeditious handling of the machines, as to their care and well being.

Apart from arrangements for washing, refilling and handling the cars, no small return may be gained on a relatively insignificant investment in sudry labor-saving appliances for the use of the operatives. This is especially true, since in many cases, the provision of special appliances means their use, where with only hand labor available, the tasks they are intended to perform might be gone over hastily or even skimped altogether under the lax eye of a careless foreman.

Thus, the provision of a complete system of air piping so that flat tires may be inflated without the necessity of moving the cars at all, or not more than a few feet at most, may save a customer's tires from standing on the rim for a period of days, or even weeks. Similarly, convenient charging appliances for ignition batteries may mean the frequent replenishment of cells which otherwise might go too long without attention. The provision of an ample number of sockets for connecting portable inspection lamps, and also for connecting in portable brass polishing wheels is another little matter which involves an inconsiderable outlay in proportion to the convenience it brings. And incidentally, where the brass is cleaned by machinery it is likely to be better and more frequently cleaned than where the old hand operation must be gone through with. Still another convenience which might be instalied at slight cost, and which would be particularly appreciated in garages where any number of closed cars are handled, is a vacuum cleaning outfit. Compressed air, such as is carried in the tire inflating line, might be made to serve the purpose, but the results obtained from its use are hardly satisfactory as compared with those derivable from the use of suction. Such an outfit, piped to a point on or near the wash rack, for example, might be made the means of drawing not a little desirable business to a garage which otherwise might be diverted elsewhere. Similarly provision for excluding dust from floors which are used exclusively for storage purposes or any other device for preserving the finish of the machines, is certain to be appreciated.

The point is this, that the average chauffeur is mightily impressed with a place in which "everything is fixed just right," and

Digitized by Google

that he is prone to like to stable his machine in a garage where orderliness and despatch are the rule. The keeping of cars really clean and sweet, appeals to the owner as much as skilled execution of repairs or an economical statement at the end of the month. Therefore the garagemar who is anxious to advertise his business would do well to make his equipment as well as his administration such that every customer will be enlisted in his service to that end.

A New Feature in Show Business.

To the casual visitor at the great national automobile shows in New York and Chicago, the vast undercurrent of trade business which underlies the surface of the exposition is absolutely unknown and unappreciated. He may become aware in some way, that trade business of one sort or another is in progress, but of the vast extent of that business, or its growth, he is as little aware as are many who are better acquainted with the industry as a whole. As a matter of fact, the tendency to put off as much business as possible until show time, has been growing each year. At first, when outputs in some measure depended upon the amount of sales business closed at the show, there was an obvious reason for withholding contracts for parts and supplies until the latter part of the week. During the past year or two, however, the discovery that many of the more important firms which were obviously free from any questions of chance were falling into line, led to recognition of the fact that the show as a wholesale mart for raw and partially manufactured parts and supplies has come to be of tremendous value to the trade.

Just how significant this aspect of the show season is at present, is revealed in one striking instance in connection with the Garden show of last week. A well-known firm manufacturing at a distance from New York foresaw the wisdom of importing to the show its chief engineer and practically his entire corps of assistants. Instead of roaming aimlessly about the Garden from day to day, however, these men were closeted in a nearby hotel on each of the six days of the show, and from half past eight in the morning until five at night. During the more or less formal sessions held, matters pertaining to the 1910 output in all its phases, were discussed. Representatives from makers of parts, accessories and even the producers of raw material were summoned and subjected to rigid examination, the exhibits at the show were freely utilized for demonstration purposes, and in a word, practically all of the details for the production of an output 30 per cent. greater than that of 1909 were arranged on the ground. Subject to revision in the interim, tentative contracts made under those circumstances will be ratified at a similar conference held during the Chicago show, so that the windup of material contracting for the entire year's business will be accomplished practically without a single mile of travel or a dollar of expense outside of what would have been required otherwise in order to afford the engineering staff opportunity to study the shows.

It has long been the custom of parts and accessories makers to utilize the show season for measuring cars on the stands and preparing specifications for their own products. Likewise not a little parts and accessory business has been transacted in a more or less spasmodic way. But the idea of manufacturers going to the show with the absolute intention of making use of the great gathering of tradesmen from all parts of the country and representing all the side lines of the industry in transacting business which otherwise would require weeks of correspondance and much contingent expense is a new and distinctly radical development, which is bound to become more general as time goes on.

It is clearly apparent that "dollar day" has outgrown its period of usefulness and ought to be effaced from all show calendars. Its original aim of clearing the stands of the non-purchasing crowd in order to afford possible buyers a better opportunity of viewing the display is no longer effective, if indeed it ever was. "Society nights" fail to draw the social high-lights to any better advantage than other nights, so far as can be observed, while the attempt to convert the show into a social function merely serves to cut down the attendance for the time being very noticeably. That those who do avail themselves of the better opportunity of viewing the show bring in sufficient return to compensate for the loss of publicity and possible business involved in the shutting out of the 50-cent audience never has been demonstrated.

Even before the doors of the Madison Square Garden were closed on Saturday night the ready reckoner had performed his deadly work; and the next day the whole world knew that motor cars to the value of $7,000,000 had been sold during the week. If the r. r. had not been so circumstantial, he might as easily have made it an even $10,000,000, but he felt called on to give the exact number of cars sold by each exhibitor. There is no doubt that some of them at least hope the figures do not lie.

COMING EVENTS

January 25-30, Cincinnati, O.—Automobile Dealers Association's show.

January 27-February 3, Philadelphia, Pa.—Automobile Trade Association's eighth annual show, Second Regiment armory.

February 6-13, Chicago, Ill.—National Association of Automobile Manufacturers' show, Coliseum and First Regiment Armory.

February 15, Detroit, Mich.—Detroit Automobile Dealers Association's show, Wayne Pavilion.

February 15-20, St. Louis, Mo.—Automobile Manufacturers and Dealers Association's annual show.

February 16-18, Denver, Co.—Denver Motor Club's first annual show, Auditorium.

February 20, 21, 22, New Orleans, La.—New Orleans Automobile Club's Mardi Gras carnival 3 days race meet.

February 20-27, Newark, N. J.—New Jersey Automobile Trade Association's show.

February 20-27, Hartford, Conn.—Automobile Dealers Association's show.

February 22, Omaha, Neb.—Omaha and Council Bluffs dealers' show, Auditorium.

February 22, Cleveland, O.—Cleveland Automobile Dealers Company's show, Central Armory.

March 1-6, Buffalo, N. Y.—Buffalo Automobile Club's 7th annual show, Convention Hall.

March 6-13, Boston, Mass.—Boston Automobile Dealers Association (Inc.) seventh annual show, Mechanics Building.

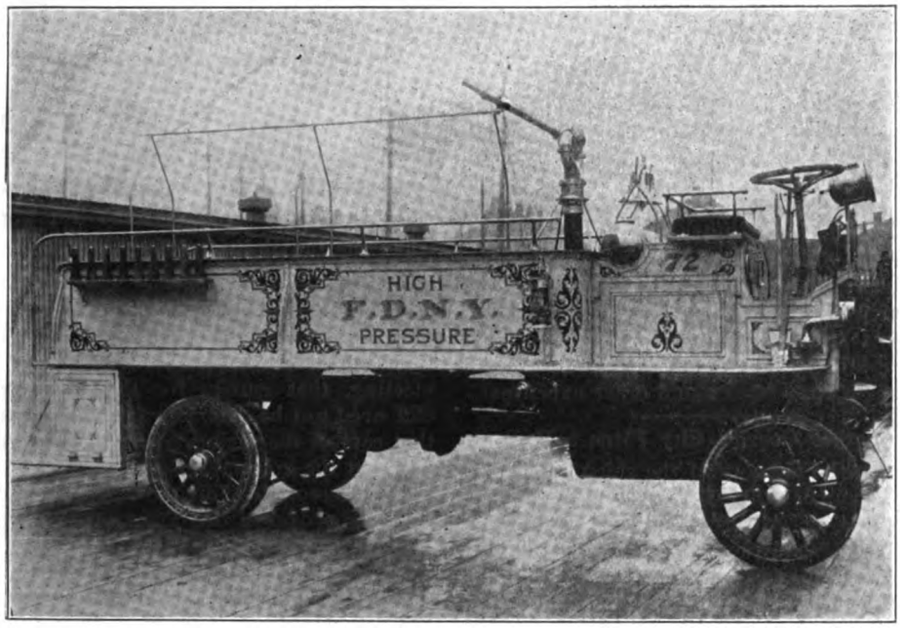
March 8-15, Kansas City, Mo.—Kansas City Automobile Dealers Association's show, Convention Hall.

March 10-13, Memphis, Tenn.—Automobile show, Auditorium building.

March 13-20, Minneapolis, Minn.—Minneapolis Automobile Show Association's show, National Guard Armory.

March 15-20, Rochester, N. Y.—Rochester Automobile Dealers Association's show, Convention Hall.

March 22-25, Ormond-Daytona Beach, Fla.—Daytona Automobile Club's four days speed carnival.



March 27-April 3, Pittsburg, Pa.—Automobile Dealers Association's show, Duquesne Garden.

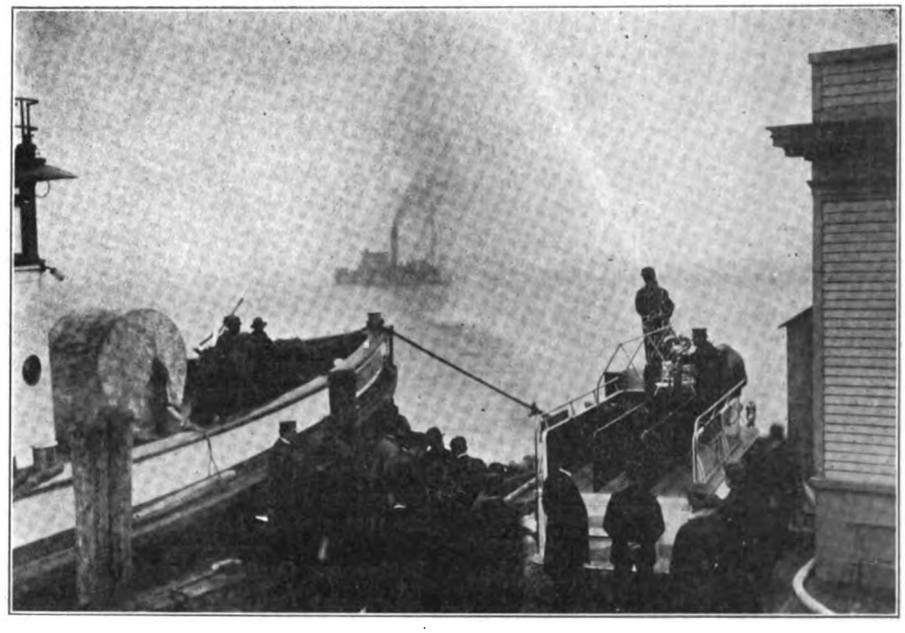
IMPROVES HIGH PRESSURE SERVICE

Automobile Hose Wagon Added to New York's New Fire Fighting System—Duty Test Pleases Chief Croker.

By way of completing its high pressure service equipment, the New York City Fire Department recently invested in a motor-driven high-pressure hose wagon the performance of which is likely to be watched with considerable interest because of its possibilities as an important connecting link in what is recognized as one of the most radical as well as the greatest system of its kind ever put into operation. The wagon, which was built by the Knox Automobile Co., to the department's specifications, is driven by a 50 horsepower, four-cylinder motor, and was exhibited in the basement of Madison Square Garden during the show of last week, where it attracted no little attention because of the initials, "F. D. N. Y." painted on its white sides. After the close of the show at midnight, Saturday, it was removed to the new repair shops of the Fire Department at 56th street and 12th avenue for mechanical inspection, and the following day was driven to the marine fire station at the foot of Gansevoort street.

NEW YORK'S HIGH PRESSURE AUTOMOBILE HOSE WAGON

The trip down town was made under service conditions, and with the right of way clear, the machine developed no less than 28 miles an hour by speedometer measurement, despite its own weight of 5 tons, and the equal load carried in its equipment. At the dock, water at 300 pounds per square inch pressure, was supplied by the fireboat Thomas Willett through parallel lines of high-pressure hose. Various tests were made, the stationary nozzle working satisfactorily at all angles and throwing a stream a maximum distance of 125 feet.



After the test, Chief Croker, who with Commissioner Whitney and other officials of the department witnessed the test, expressed himself as thoroughly satisfied with the results and hopeful as to the prospect of service with the machine.

"This piece of apparatus is an important addition to the department," he said. "It carries plenty of hose, is faster than any horse-drawn machine and is just what is needed. In fighting a fire the first few minutes are the most important. It is this feature that makes the automobile type of apparatus so desirable."

The machine is built upon ordinary commercial vehicle lines, so far as the method of chassis construction and body mounting are concerned, though the open body is of heavy sheet metal with riveted and reinforced joints and seemingly extraordinarily heavy. The body, in fact, is in design an almost exact copy of the regular type of high pressure wagon, and is capable of carrying 2,000 feet of 3-inch hose. It has a rated speed capacity of 30 miles an hour over city pavements, has 154 inch wheel base, and is shod with solid tires. those in the rear being of the twin type.

The motor is mounted vertically in front, the radiator coming flush with the dash and the driver's seat being raised to a considerable elevation over it, as in ordinary commercial vehicle design. Directly back of the seat is mounted the standard for the fixed nozzle to which the high-pressure hose is connected, while the usual rack for tarpaulins and the extra nozzle stands are mounted over the centre of the body and at the sides in the rear respectively. The mechanism of control is the same as is used in ordinary practice except that a steering wheel of very large diameter is employed. Transmission is by cardan shaft to the gear box, which is mounted centrally of the chassis, and thence by double side chain to the rear wheels.

The first practical test of the machine occurred yesterday (Wednesday) when it responded to an alarm caused by a fire on the fourth floor of the six story building Nos. 115-118 West 17th street Starting from Station No. 72, on East 12th street, between Fifth avenue and University Place, for which it was ordered, it reached the scene of the fire some three-quarters of a mile distant in three minutes from the sounding of the tapper. Only the high pressure apparatus was used in subduing the blaze, and the new truck was said to have worked to the complete satisfaction of the officials in charge on the occasion of its first real service.

OLDFIELD LEADS ALL THE WAY

Makes Seyfried Take Dust Throughout Five Miles Match at San Diego—Both Fail in Attacks on Records.

Having rebuilt the old White Flyer, which was wrecked at Ascot Park, Los Angeles, a short time ago, and having nursed it back to health, Gus Seyfried made an effort to beat Barney Oldfield at San Diego, Cal., on Sunday, 17th inst. The Coronado, the scene of the race meet, was packed almost to capacity, by a crowd that had been told that Oldfield was going to lower world's records, a promise Oldfield has occasionally made before. This driver, however, did not succeed in clipping any fractions of seconds from existing records and in his attempt to touch the mile mark, he came nowhere near the figures of 0:51 flat made by Ralph De Palma in the Fiat last fall.

Nevertheless when Oldfield in his six-cylinder Stearns lined up, with Seyfried at the wheel of the freakish looking White, for a 5 miles match, the former got the jump at the start, and thanks to the dust he managed to raise, succeeded in holding the lead throughout the race. Seyfried followed closely in his wake, but Oldfield having secured the pole on the first turn, kept it all to himself, his method of swinging curves forcing Seyfried to slow down several times to avoid a collision. Seyfried kept eating the dust until the fifth lap, when he made a strong attack in the homestretch but Oldfield nosed in first by a small margin, the time being 5:56⅘.

Earlier in the afternoon, Earl Pfeiffer, in a White steamer, won the 3 miles event for cars listing at $3,000 and under, in 5:04, his competitors who were on a slow running schedule, giving him no trouble. Then Oldfield let out his car in a 3 miles event and romped in first in 2 minutes 56⅗ seconds. His fastest lap was made in 0:56⅗.

Seyfried drove alone for a 3 miles exhibition, which he covered in the lively time of 2:54⅕, after which a special 2 miles race for the Spreckels trophy was won by R. Naylor in a Stearns, and the wind-up event, a 3 miles handicap, free-for-all, was captured by Seyfried in the White Flyer to the tune of 3:31⅗.

The summaries:

Three miles, open to cars costing $3,500 and under—Won by Earl Pfeiffer, White steamer. Time, 5:04.

Three miles—Won by Barney Oldfield, Stearns. Time, 2:56⅗. Fastest mile, 56⅗ seconds.

Three miles exhibition—By Gus Seyfried, White Flyer. Time, 2:54⅕.

Five miles novelty race; stops to be made to take on passengers and drop them, the last mile to be finished alone—Won by a White; second, Tourist. Time, 9:18.

Five miles match, Oldfield and Seyfried—Won by Barney Oldfield. Time, 4:56⅗.

Special two miles race for Spreckels' trophy—Won by R. Naylor, Stearns. Time, 2:46.

Three miles, handicap, free-for-all—Won by White Flyer. Time 3:31⅗.

Motor Parkway Patrol Gets Its Pay.

If Sheriff Joseph H. Foster, of Nassau county, had writer's cramp on Wednesday last, it is not to be wondered at, for he signed very close to 1,000 checks. In his sleep that night, he signed 15,000 more, but that has nothing to do with the case. It seems that after months of long, weary waiting, the special deputies and flagmen who patrolled the Long Island course during the Sweepstakes and Vanderbilt Cup race last fall, have at last received their pay. The checks, which were for $6 each (two days' pay), were soothing syrup to many of the impatient ones who had grown petulant with protracted waiting. In connection with the paying off of these debts, it was stated at Mineola last week that there still remains about $10,000 in unpaid bills, for road repairs and other expenses.

Another Georgia City Plans a Race.

With the memory of the splendid success of Savannah still in mind, automobile enthusiasts of Albany, Ga., are planning a 150 miles road race to cover a circuit, beginning and ending at that place. The date of the contest has not been definitely decided upon as yet, although it is expected to be set for the middle part of February. Practically all of the drivers who have promised to enter are private owners and the roads over which the contest is scheduled to run, will include both good and bad varieties, as no preparation or resurfacing will be done in anticipation of the event.

Crack Drivers for Mardi Gras Meet.

In addition to numerous local entries for the New Orleans Mardi Gras race meet to be held February 20-22, a number of positive entries of New York dealers have been made and several star drivers will be seen in the 24 hours race and the short distance events. Among those who will appear are Lewis Strang, driving an Isotta, his old love; Ralph De Palma with the Fiat; two Renault cars, one of which will be handled by Basle, while several other well known drivers are being negotiated with to drive cars that already have been entered.

Bridgeport Cards Memorial Day Climb.

Memorial Day, May 31, has been fixed upon as the date for the Automobile Club of Bridgeport's annual hill-climbing contest, and the contest committee already has commenced active preparations for the event, which is to be the fourth of its kind. It has not as yet been decided where the contest will be held and two hills, Sport and Snake, are both under consideration. Last year the climb was held with success on Sport hill.

ANOTHER BRIARCLIFF REVISION

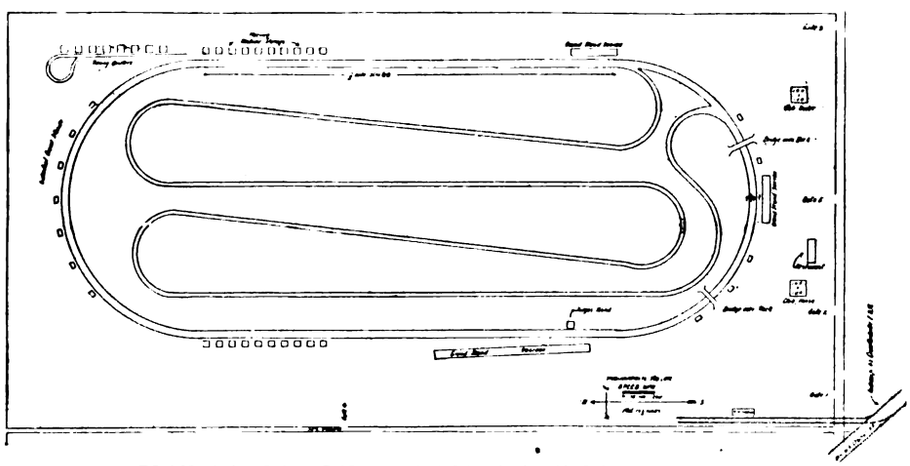
New Rules Practically Restore Limitations of Last Season—Cars of the Racing Type Eligible for Entry.

For the third time within a few weeks, the rules for the Briarcliff trophy race were changed on Monday last, 25th inst., at a meeting of the committee of management, held at the Automobile Club of America. As is well known, the rules promulgated at the two previous meetings caused no little dissatisfaction on the part of several makers, so after a long discussion on Monday, it was decided to agree to a larger bore and the limitations now are practically the same as they were last spring when the initial Briarcliff contest was run.

As the rules now stand, a bore of 5¾ inches is the maximum, and there are no limitations as regards stroke, and no weight limit. It was also resolved as at the last meeting, that entries for the next Briarcliff need not be "stock" cars, which means that cars of the racing type will be eligible, and that the original purpose of the contest is to be ignored. This, however, is subject to the approval of the donor of the trophy, Walter W. Law.

The vacillations of the committee in the matter of adopting a set of restrictions for the cylinder dimensions of competing cars have been amusing. When the first meeting was held on December 16, the maximum bore was placed at 5¼ inches; the minimum weight 2,600 pounds, and the minimum wheel base 110 inches, there being no stroke limit. This caused trouble right away and at a second meeting called a few days later, the limitations were changed as follows: Maximum bore, 5⅜ inches; maximum stroke, 6 inches; minimum weight, 2,300 pounds, and minimum wheel base, 118 inches. The new ruling, which requires a bore of not more than 5¾ inches applies to four-cylinder motors, as did the previous sets and cars with different numbers of cylinders will be required to show an equivalent piston bore area in the aggregate in order to qualify for entry.

Pittsburg Schedules a Three-Ply Run.



Pittsburg, Pa., is to have a three days endurance run on March 17, 18 and 19, under local newspaper auspices of the Chronicle Telegraph and Gazette Times. It will be held along the usual lines of endurance tests, cars being divided into price classes, with awards for the best performance in each class. Approximately 150 miles per day will be covered over three different routes with Pittsburg as the starting and finishing point of each day's trip, and contestants with tied scores at the finish, if there are any, will be required to start out and cover the route a second time on an elimination run.

MOTORDROME FOR INDIANAPOLIS

Company Organizes to Build a Big Combination Track and Course—Specifications of the Construction Plan.

From present indications, Indianapolis, Ind., is to have a pretentious new motordrome within a few months. The Indianapolis Motor Speedway Company recently organized with a capital stock of $200,000, expects to start work on the construction of the new enterprise by February 15. Details of the course have just been announced. On a tract of land covering no less than 320 acres, an oval is to be constructed measuring 2 miles in circumference, 50 feet in width in the stretches, with banked turns 60 feet wide. Inside this oval, there will be a road course composed of three loops running lengthwise symmetrically and joining the main course at one end. These measuring altogether 3 miles, will be about 25 feet wide on an average with 35 foot turns.

PLAN OF PROPOSED MOTORDROME AT INDIANAPOLIS

This construction will permit of combination road and track racing, and in the entire course a complete round with its numerous turns will be 5 miles. The straightaway stretches on the loops will be more than one-half mile long, to make short distance speed trials possible. The promoters believe that the scheme will furnish track and road facilities for driving and testing cars at high speed and long distances, to a degree such as never before has been attempted. The ground will be equipped with ample training quarters and space for camps during contests; there will be three main grandstands with a seating capacity of 35,000, and 20 smaller stands placed at intervals about the course. The two miles oval will be equipped with a new lighting system, 420 arc lamps with reflectors throwing light ahead of the drivers, so that 24 hours races can be held under most favorable conditions.

A club house of the Indianapolis Motor Car Club is to be erected on the grounds, in addition to which a restaurant and cafe building for the public will be put up. The officers of the new company are: President, Carl G. Fisher; vice-president, A. C. Newby; second vice-president, F. H. Wheeler, and secretary and treasurer, James A. Allison.

The company expects to make an effort to obtain the Jefferson De Mont Thompson stock chassis race as an opening event for this course and while this is rather doubtful, the concern is taking steps to affiliate with the American Automobile Association. The promoters also are desirous of obtaining an international event for the West each year, and a cup valued at $5,000, to be known as the Wheeler-Schebler cup, has been promised for the purpose, while for lesser race meets arrangements are being made for the provision of liberal prizes that will exceed in value the more customary rewards for winners

Atlantic City Has a Motordrome Vision.

The Estates & Mortgage Co. is the style of an enterprise incorporated last week under the laws of New Jersey, and which is alleged to have purchased a tract of 400 acres of land on Chelsea Heights along the Meadow boulevard, Atlantic City, N. J., upon which there may be built one of those numerously unbuilt motordromes of gigantic proportions. The promoters claim to have $1,000,000 to spend on the venture and expect to build a 2½ miles oval course, with the intention of holding a series of weekly race meets during the summer season. In connection with the track, a large concrete garage and other buildings will be, or may be erected.

The original sponsor of the scheme was a New York sporting man who removed to Atlantic City and who hit upon the motordrome idea when his business became dull due to a wave of morality which swept the seashore resort. His prospectus called for a permanent automobile show among other things, and revealed prodigious profits on the stock which was to be offered for sale. He figured that two or three hundred manufacturers would pay from $1,000 to $5,000 each for the privilege of exhibiting.

NEW PLANS FOR RACE CONTROL

Makers Take Steps to Organize a National Governing Body—Will Take Further Action During Chicago Show.

Since the American Automobile Association decided to abandon all control of racing on circular tracks, the matter of race government has been very much in the air with probabilities strong that the manufacturers would yield to the temptation to step in and assert their own pretentions to the control of sport. Just this has occurred, the first steps toward the formation of a new racing association body, which is to be composed entirely of manufacturers and dealers, having been taken on Thursday last, 21st inst., when a meeting of a number of the makers who were exhibiting at the show and others, was held in Hotel Victoria, New York City. Percy Owen, who was temporarily placed in the chair, outlined the general idea of the proposed organization, urging the present need for a governing body, national in scope, citing the desirability of sanctioned race meets in place of the tendency to the promotion of wildcat affairs as is the case at present. The matter of cylinder dimensions and weight limits is another thing that is bothering manufacturers who are being forced to build various sized cars for various races, at great expense, and was suggested as presenting ample opportunities for legislation.

In connection with this, H. E. Coffin of the Chalmers-Detroit Company declared: "It is obviously foolish to class all motors together. What we want are rules to classify stock cars, and we ought, besides, to have open races with broad limitations, so that engineers and designers might have the opportunity to exercise their ingenuity in the production of new models."

George H. Strout, of the Apperson Automobile Co., suggested that the new body should consist of 25 manufacturers or importers who have been consistently identified with racing and that they in turn appoint a committee to consist of two manufacturers and three experts in no way connected with the manufacture or sale of cars, to formulate rules. This plan seemed acceptable to those present.

A temporary organization committee was appointed to notify all the manufacturers as far as possible, of the second meeting. This, it was agreed to have take place at Chicago during the week of the coming show—February 6, 1909—at which representatives of makers are to be invited and permitted to have a voice in the new project.

As yet the organization is without a name, but the title American Motor Racing League, has been suggested as a suitable designation for it.

BUSINESS VIEW OF GLIDDEN TOUR

Some Pertinent Suggestions Concerning the Choice of Route—Consideration for the Manufacturers' Interest.

Now that the manufacturers have come to express more openly their purely trade interest in automobile contests in general, it is interesting to note the various considerations which are being taken into account in the formation of plans for the forthcoming Glidden touring contest, in which provisions are now made for the trade entrant without any attempt at concealment.

Frankly considering the tour as an advertising investment pure and simple, questions as to the route, which yet remains to be chosen, assume an importance hitherto unrecognized by the public — perhaps by even the managements of former tours. The success of the tour from the maker's point of view, in a word, depends largely upon whether it is laid through a country which is barren from the standpoint of the salesman or equally profitable, and this attitude is particularly enlightening as revealed in the following interview which is credited to Fred L. Estey of the Studebaker Automobile Co., who discusses the respective merits of various routes which already have been proposed.

"Is the interest of the automobile manufacturer, who really pays the expense of the Glidden tour, to be given consideration, or will the next Glidden be arranged on the basis of a St. Patrick's Day parade, in which the ambition of every participant is to have the pageant pass his own front door"? Estey inquires.

"In reaching this interrogation point," he continues, "I am governed partly by the fact that guessing on the probable route of the next Glidden has assumed the importance of a national winter pastime, and partly by persistent rumors to the effect that Mr. So-and-so of the touring committee demands that the tour visit his home town, and that Mr. Somebody-or-other wants to play 'My Old Kentucky Home,' on an auto horn, at Bardstown, Kentucky, the birthplace of that well-known and venerable tune.

"I have passed through Bardstown in an automobile; have visited the Old Kentucky Home for several pleasant hours; have inspected the famous bell which Louis Phillippe of France presented to the Bardstown church, according to tradition; have visited several distilleries in the neighborhood, and slept (four in a room) in the 115-year-old hotel at the picturesque town, but as an automobile mart, Bardstown does not impress me as a particularly important shopping center.

"Not yet, in my belief, has Kentucky reached the motor car buying stage which would warrant the manufacturer in expending the necessary amount of money to grant a dozen employes the luxury of a drowsy tour through the 'still' district of the neighboring mountains and sleepy hollows.

"Still another much-discussed possibility is the long tiresome run from Omaha to Denver, over highways where speed laws are a joke; where farmhouses are 15 miles apart, and no hotels worthy of the name from one end of Nebraska to the other.

"To be sure the Nebraska farmer is a persistent buyer of automobiles; in fact has been enthusiastic so long that a motor car may be seen in nearly every farmyard, but the possible future market does not demand an expenditure of $10,000 worth of advertising on the part of each manufacturer who backs the Glidden tour.

"From careful study of the situation, after touring the Central West for several months, I am impressed that any selection of a route which does not include the great cities of the northwest will be a business mistake. Minneapolis, St. Paul, Duluth and Milwaukee and the smaller but none the less prosperous cities of Wisconsin and Minnesota, are absorbing automobiles in large quantities and cars of excessive value as well as low-cost machines are enjoying a ready sale.

"Iowa, too, while not as populous as some states, is buying more cars in proportion to the population, than any other state in the country. There are no big cities in the state but every hour the tour might pass through a city of enterprise and importance.

"The average wealth in Iowa is greater than any other state in the Union with the exception of conservative Massachusetts and the farmer is keen to buy an automobile with speed enough 'to get away from his neighbor's dust.'

"Missouri is impractical as a touring state for the Glidden, though there are reasons why St. Louis or Kansas City should be visited, even though the state may not be crossed. It would not be feasible to go to both cities. St. Louis now harbors less than 1500 automobiles all told and needs an awakening of its 800,000 possible buyers. Kansas City is the buying centre for the corn and cattle belt of the southwest and is enthusiastic for the tour. It is a fair market for high-priced cars and an excellent centre for moderate and low-cost automobiles.

"It is noteworthy that nine out of ten prospective routes mentioned are based on sentiment rather than on plain business sense, yet, several years have passed since the Glidden enjoyed an amateur aspect. It is high time that the manufacturers express themselves forcibly for a route which will net them ample return for the expenditure of time, thought and money in the country's greatest advertising pageant, the Glidden tour."

REVISION OE QUAKER CITY AWARD

Disqualification of McNamara's Premier Said to be Revoked—Miller's Matheson Relegated to Second Place.

It is reported that on Tuesday of this week the contest committee overruled the ican Automobile Association overruled the decision regarding the winner of the Quaker City Motor Club's Philadelphia-Wilkes-Barre endurance run, held on January 2 last. According to R. M. Owen & Co., agents of the Premier car in New York City, the contest committee overruled the prize award of the Philadelphia club and decided that the Matheson car which was given first place is not entitled to it, in view of the performance of the Premier entry driven by Ray McNamara. In regard to these two contestants, the point at issue was whether or not the Quaker City Motor Club's committee erred in disqualifying the Premier for unloading its passengers, while passing a stalled competitor on an icy grade on Giant's Despair mountain, in order to regain traction. Aside from this incident, McNamara's car had a perfect score, which was considerably more than the rest of the 32 contestants could boast. Upon examination by the technical committee, this car did not receive one single demerit; its nearest competitor, Miller's Matheson, being charged with 11 points. With the reinstatement of the Premier, the contest committee of the A. A. A. decided that this entry was entitled to the McDonald Campbell trophy.

Whether or not the Quaker City Motor Club or the Matheson entrant had any voice in the investigation of the A. A. A. contest committee or whether the decision was official, could not be learned on Wednesday at the headquarters of the American Automobile Association. It was said that Chairman Hower had left town and the Secretary of the association could not tell where any other members of the contest committee could be located, and was unable to make any official statement in regard to the case.

Automobiles Race on Bicycle Saucer

French promoters will go to any extreme for the sake of providing the patrons of their velodromes a few thrills above the ordinary. Witness the automobile match race at the Velodrome d'Hiver, Paris, January 10th, between Sizaire and Naudin, makers of the voiturette which bears their joint names. The track measures only five laps to the mile and is steeply banked for bicycle racing. Despite the fact that it was barely wide enough for the two racing voiturettes Sizaire and Naudin electrified the crowd by a neck and neck race until something happened to the machine driven by the latter. Sizaire finished the 10 kilometres in 8 minutes 20⅘ seconds.

TAKING IN THE WHOLE SHOW

Impressions of Lay Visitors as Gathered by a Motor World Scout—Their Odd Inquiries and Comments.

"—— And then the gas is compressed by the compression stroke and the explosion is caused by a tiny spark igniting the mixture at the physiological moment—" explained an intelligent demonstrator at the show to a person uninitiated in the mysteries of the gasolene motor. But the Motor World scout paused no longer at that booth to learn more about "mixtures" and "physiological moments"; he proceeded on his way to see more of the wonderful things displayed in that arena of the "Circus Maxims," as the press agent called it—that remarkable Ninth annual show of the Association of Licensed Automobile Manufacturers.

While this exhibition was hardly like the every day circus at the Paris resort, made famous by a certain Widow not long since, nevertheless if one were to go to old Maxims, where fun and frolic, etc., holds forth, one would hardly find the girls more pretty, dainty and witty, than a goodly portion of that Directoire peach crop which bloomed nightly in the tonneaus and front cushions of the many handsome cars displayed. Do-do, Chlo-Chlo, Jou-jou and Velia were all there and while "a thing of beauty is a joy for a joy-ride," as a salesman, who seemed to know very little about his product remarked, these mesdames distracted as much attention as they attracted to the cars. Some of the prospective and near-prospective purchasers of machines were kept so busy looking into the fine points of the cars' feminine adornment, that they neglected to note the fine mechanical features. On Tuesday, 19th inst., "Society night," there was an array of gowns that would have done credit to any horse show. "Society night," it must be explained, is the night upon which everyone who is not a member of the smart set, tries to attend, in the eager hope of getting mentioned in the "among those" list. The real "400" do not appear that evening.

Ah! See what's here! Look at the queen sitting in that runabout right back of the fountain. How the hot-house diamonds and fishskin pearls gleam! Looks like a showgirl. She is ill at ease, because the man who plays the pink spot-light on the fountain will not flash its beams in her direction. "Come on, Mame," she says to her less radiant friend, "Let's us go look at the toy tonneaus."

"Toy tonneaus? What's them?" Mame inquires.

"You know, those Brownie cars that they make for kids to play in. Little Hennie seen one at the last show and wants one."

Right over there was the Knox car exhibit. This car, the attendants said, was "all the poison" at numerous hill-climbs last year—Knox vomica, as it were. They confided to some persons that the company intends to put out a six-cylinder car in 1910. Nothing was said by them about the spark occurring at the proper time and the thought came a-randoming overthwart the scout's mind, that perhaps most of the "fizzyological moments" are down in the rathskeller. Scout proceeded to next booth to ask questions, which peradventure, the salesman could answer.

One of the bad features of automobile shows in the past, has been the lack of competent attendants at the various booths. Those who knew almost nothing about the fine points of the cars they were showing seemed to be in the majority. In some cases, attendants or "salesmen" have been found who actually did not know how their own motor or transmission worked, and if asked a question about the differential, they would walk around and commence to look at the magneto or steering gear and utter incoherent phrases. The writer has talked with numerous gentlemen of this caliber, who could not tell a light "six" from a large four-cylinder motor by mere external examination. Inquiry from a person higher up—else a demonstrator—was necessary.

This state of affairs has been the manufacturer's misfortune rather than his fault. At show time, the whole workings of the factory organization are thrown out of gear; it is difficult and expensive to spare good men from the factory and for a fair sized exhibit, a large staff of men is required, in order that some of them may be in attendance at all hours. Most of the responsible members of a concern are obliged to attend a few meetings, luncheons and dinners during the week, in addition to making business visits in various parts of the city, and companies have been forced in the rush of things, to employ inexperienced men as booth attendants during show week. As a result, persons who are really interested in the mechanisms of the various cars, have been obliged to find out by themselves what they desire to know, unless the designer or a factory man happens to be around.

At last week's show, however, there seemed to be more attendants who really knew what they were talking about and less shoe clerks and glove salesmen, laboring under the impression that change-speed gears are speedometers and thinking that torque-rods are talk-rods, meanwhile wondering if "talk-rods" are "talking points." No doubt manufacturers and dealers realize more than ever before that A1 men are the only ones worth having around their space.

Now the scout, whose toes had been stepped upon much by the throng, and who had been forced to step upon his own toes occasionally when jostled, slipped into the space partitioned off for a company from Detroit—a city in which motor cars are said to grow on trees. Here he met the publicity man of the concern, who had torn himself away from the press room long enough to descend to the main floor and talk to some girls. He confidently breathed the news—let it slip and ooze out of him—the news that Anthony Comstock was expected at any moment at the booth next door, for St. Anthony had heard that there was a stripped gear on exhibition in the Garden. This well-known personage and friend of one Jake Schreyer, is making a bare living these days and is actively on the lookout for things dishabille.

When asked whether the cars profusely strewn about that booth are equipped with dual ignition or not, publicity man dunno. He says to ask the designer, certainly, and "wait around" for Comstock.

Around the Fourth avenue end the Locomobile Vanderbilt Cup winner ("Success" —Herald) and the Thomas New York-Paris car ("Success"—Times), likewise the Vanderbilt Cup itself ("Success"—Herald) attracted no end of admiration and Miss Celia St. Regis the Red Soubrette, in observing the cup car, audibly remarked several times, so that the crowd around might hear her, that in the spring, she guessed she would buy the winner of the famous classic to drive in her new show. She asked the demonstrator what its motive power was—steam or electricity—and he, regular kidder, replied "Liquid air." In fact numerous salesmen were called upon to answer so many fool questions, that their sense of facetiousness occasionally ran away with them.

But having looked at some of the cars, the scribe decided to dive down into the basement and have a squint at a few accessories. Paying no attention to the kind friends who told him to look at the Lavalette exhibit and that Lavellettes were a new style of landaulettes, when he knew very well that Lavellette & Co. handled magnetos, he plunged into the stuffy abyss. What delightful dreams the accessory array can produce! After the motorist or mere plain person has trekked through the basement and also the galleries, listening to all that glib demonstrators tell him, then wends his weary way homeward and retires, somehow the camshaft of his eyebrow short circuits with the throttle valve on the left ear, and an anti-freezing solution in his hair rusts the skid chains on his chin and the trans-mission furniture in the room spins around on the jack-shaft of the os calcis, and all 32 cylinder cavities in the upper and lower sets of teeth, which are out of mesh, all fire at once and raise particular Billiken jinks with the carburetter, so that the person does not get the right "mixture."

At one accessory booth, the scout was hailed by a rather breezy demonstrator who began with: "Hey you—Interested in automobiles?"

"No," was the answer, for Scout opined that he had seen enough automobiles.

Digitized by Google

"Interested in motorcycles?" was the follow-up.

"No."

"Commercial vehicles interest you?"

"No."

"Then what in —— are you doin' here?"

While it could hardly be called suave or delicate, it was nevertheless, quite to the point.

After looking over, almost overlooking the motorcycle section—because of the crowd which surrounded it—the scout climbed aloft to see what he could see among the exhibitors there. A sweet young thing away up in nigger heaven informed him that a certain invention for carrying beverages and keeping them at hot or cold temperatures, was called the Janus Bottle. When asked if she was Elsie Janis, star of "The Fair Co-ed," she replied in the negative.

Yes, the scout ran the whole gamut of the tire, supplies, and accessory makers listening to and believing all that was told to him, and after having satisfied himself that the Austro-American Separator Company was not an international firm of divorce lawyers, but manufacturers of funnels instead, he trotted home to dream that having completed his circuit of the Garden and its exhibits, the circus Maxims itself began gravely to circle about him.

The Directory and the Siamese Twins.

During the Garden show they were telling a good story respecting the so-called "automobile trade directory," which is a half brother of the Blue Book and a similar kin of those "siamese twins," The Automobile and The Motor Age. It appears that during an idle period the advertising solicitor for one half of the "twins" was ordered to dip into directory work. Following his instructions he called on an advertiser in one of the twins and solicited an ad. for the directory.

"Why should I advertise in the directory?" inquired the more or less astonished manufacturer, who was aware that the four publications have the same parents.

"To make yourself known to the trade," promptly replied the solicitor.

"Then in the name of heaven, will you tell me why I have been advertising in The Automobile and The Motor Age for the past several years?" rejoined the manufacturer.

The response of the solicitor is not recorded.

Washington to Manage Washington Show.

Washington's 1909 automobile show is to be managed by B. C. Washington, who has managed seven previous shows in the National Capital. Although the date has not yet been definitely set, the affair will be under the auspices of the Automobile and Cycle Dealers' Association, which has just been formed. The officers chosen are as follows: President, R. A. Klock; vice-president, T. N. Mudd, Jr.; secretary, J. D Carpenter; treasurer, E. C. Graham.

PHILADELPHIA OPENS HER SHOW

Nearly Fifty Makes of Cars Brilliantly Staged at Second Regiment Armory—Accessories Well Represented.

Following close in the wake of the New York shows, Philadelphia's eighth annual show was opened last evening, Wednesday, 27th inst., with less ostentation but much the same pomp and an even greater amount of enthusiasm on the part of the visitors, than marked the preceding exhibitions at the Palace and Garden in New York. In addition to being the first of the purely local shows, at which the various cars are shown by the agents instead of by the manufacturers themselves as they are at New York and Chicago, this is the first show of the year at which the products of the "licensed and "independent" manufacturers, as they are known to the public, are brought together. On this account it is of particular individual interest, more especially since it is graced with a number of exhibits brought direct from New York.

In previous years it has been the custom to open the Philadelphia show immediately after the close of the Garden show in New York, and in consequence, many of the demonstrators and stand attendants have been wearied with their efforts of the previous week, while it has frequently been the case that exhibits shipped from New York have been delayed in transit and have arrived only for the latter part of the week. The Wednesday opening date this year, is therefore a welcome innovation. Another innovation is the staging of the show in the Second Regiment Armory, Broad and Susquehanna avenues, instead of the First Regiment Armory, where it has located on the past two occasions.

The roster of exhibitors includes the names of 48 agents of cars or branch house representatives of the manufacturers, among which but one foreign country (Italy) is represented in the Fiat and Isotta exhibits. The accessory representation numbers 12 concerns.

The color scheme of the armory is gaudy, to say the least. A blending of cerise and Nile green was what the decorators devised to please the eyes of Philadelphians. An immense canopy of bunting gives the impression of a gigantic tent with a multi-ringed circus. White columns mark the dividing lines between the various booths and a double row of columns forms a "court of honor" leading from the main entrance. A central cluster of electric lights and myrads of other bulbs provide the illuminative effect and the unsightly iron girders are quite hidden in the array of decoration.

The exhibitors are the following:

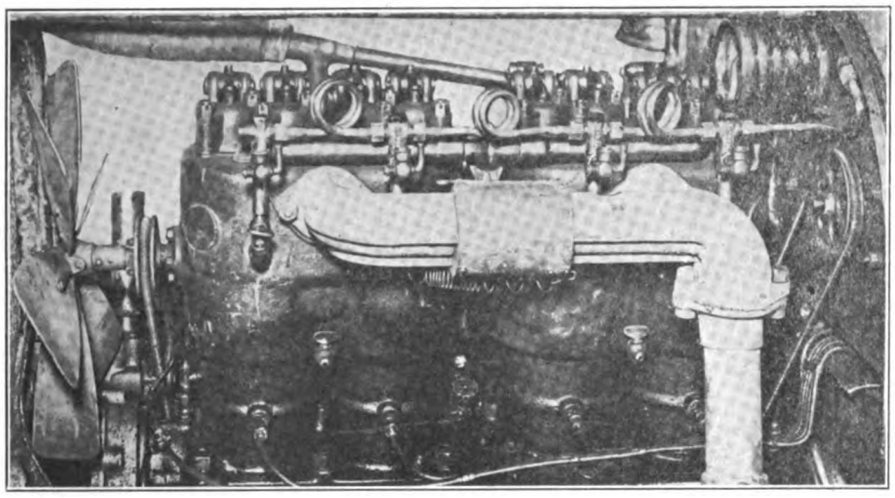
Automobiles.

Acme Motor Car Co., Acme.
Autocar Co., The, Autocar.
Automobile Sales Corporation, Peerless and Cadillac.
Adamson, Prescott, Columbia.
Bergdoll Motor Car Co., Chalmers-Detroit and Thomas.
Brazier, H. B., Marmon.
Carroll Power Co., Carroll.
Chadwick Engineering Works, Chadwick.
Fiat Automobile Co., Fiat.
Ford Motor Car Co., Ford.
Foss-Hughes Motor Car Co., Pierce-Arrow and E-M-F.
Franklin Motor Car Co., Franklin.
French, L. E., Pullman.
Gawthorp & Wister, Elmore.
General Motor Car Co., Lozier
Hamilton Automobile Co., Stoddard-Dayton.
Harper D. Walter, Stanley.
Hills Motor Car Co., Royal Tourist.
Jackson Motor Car Co., Jackson.
Keystone Motor Car Co., Packard.
Locomobile Co of America Locomobile.
Longstreth Motor Car Co., Maxwell.
Matheson Automobile Co., Matheson.
North Philadelphia Automobile Station, Knox.
Oxford Automobile Co., Brush and Gaeth.
Palmer & Singer Mfg. Co., Palmer & Singer and Simplex.
Penn Motor Car Co., Mitchell.
Philadelphia Automobile Co., Apperson.
Quinby & Co., Pennsylvania and Isotta.
Sprankle, W. J., Overland.
Standard Motor Car Co., Middleby and Speedwell.
Stoyle Automobile Co., American and Grout.
Spalding & Bros., A. G., Stevens-Duryea.
Studebaker Brothers Co., Studebaker.
Tioga Auto Co., National and Rambler.
Twining, Thomas M., Regal-Detroit and Crawford.
White Garage, White steam cars.
Winton Motor Carriage Co., Winton.
Wyckoff, Church & Partridge, Stearns.

Accessories.

Auto Equipment Co., accessories.
Auto Light & Equipment Co.
Brown Auto Top Co., tops.
Caloris Mfg. Co., Caloris bottles.
Gibney Bros., James L., tires and accessories.
Manufacturers Supplies Co., accessories.
Nock Co., G. W., supplies and accessories.
McCullough & Sons, J. H.
Keystone Lubricating Co., lubricants.
Paynter-Spitzel Co.
Puritan Soap Co., hand soap.
Standard Rubber Tire Co., Republic tires.

Cincinnati's Second Show Draws Well.



With a roster of exhibitors representing no less than 32 different makes of car, practically all of which have been seen in New York this year, Cincinnati's automobile show, which is being supported by the Cincinnati Automobile Club, was opened to the public on Monday evening last, 25th inst It is the second of its kind, and from the tradesmens' point of view is important as drawing a good class of prospective buyers from the wide areas of the southern portion of Ohio, as well as from Indiana, Kentucky, West Virginia and some of the southern States. The decorative scheme which has been applied to the Armory is in white and gold colors, with mural panels set off in evergreens, while the entrance is masked by a garden effect, in which real and artificial plants, a fountain and fish-pool are effectively displayed.

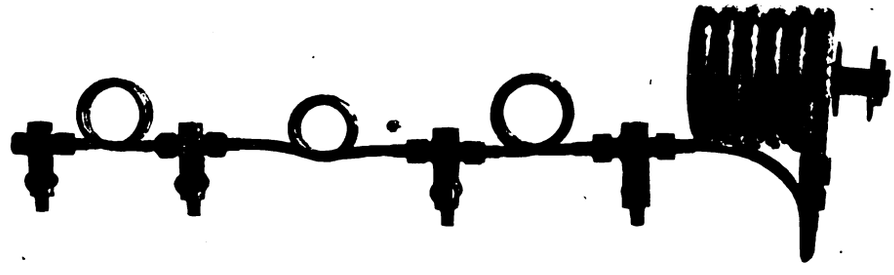
MECHANICAL INFLATION OF TIRES

Maxim Invents System for Use of Live Gas from the Engine—Specifications of the New Appliance.

Tire pumping always has been the chief drawback to tire inefficiency in the mind of the average motorist and granted a relief from the delays and vexations of having to stop and inflate tires by means of the ordinary foot pump, it is a safe assumption that tire troubles would weigh far less heavily on the mind of the user, be he owner or chauffeur. On this account many attempts have been made at the provision of some means of inflating tires by mechanical devices of one sort or another. These have run the whole gamut from the automatic arrangement intended to pump continuously and attached directly to the wheel, to the power pump actuated in some way from the engine and more or less cumbersome according to the relative amount of skill possessed by the inventor. The latest arrangement of the sort, however, is radically simple, being, in fact nothing more nor less than a method of tapping the cylinders and removing from them a certain amount of live gas which after being circulated through a cooling system which is peculiar to the arrangement, is delivered directly to the affected tire through a hose, and at any desired pressure.



MAXIM TIRE INFLATOR INSTALLED ON A 4-CYLINDER MOTOR

The system in question is the invention of Hiram Percy Maxim, well known as an automobile engineer long before the days of his recently achieved silent firearm. The device, which is applicable to any type of motor, and in no way interferes with the arrangement of the motor save in the attachment of special fittings to the cylinders in place of the ordinary pet cocks, is extremely simple and free from complexities.

As the accompanying pictures show, the essential element involved is a single lead of copper tubing connecting the tops of the various cylinders and terminating in a close coil which is mounted on the dash. Between each pair of cylinders a single loop is formed in the tube, which, aside from its cooling function, renders the system perfectly independent of any tendency of the cylinders to "work" under severe stress. The cylinder fittings consist of connections which replace the ordinary stock pet cocks, but are branched in such a way that the pet cocks may be replaced after the apparatus is installed, so that they still may be used as occasion may require. Furthermore, each of the fittings is equipped with a steel ball valve so that the series is made to operate much like the ordinary check valve employed in securing pressure for the fuel feed. Being of different proportions, however, and connected in series, the effect on the line is to secure a much greater pressure and volume of gas than the simple check will deliver.

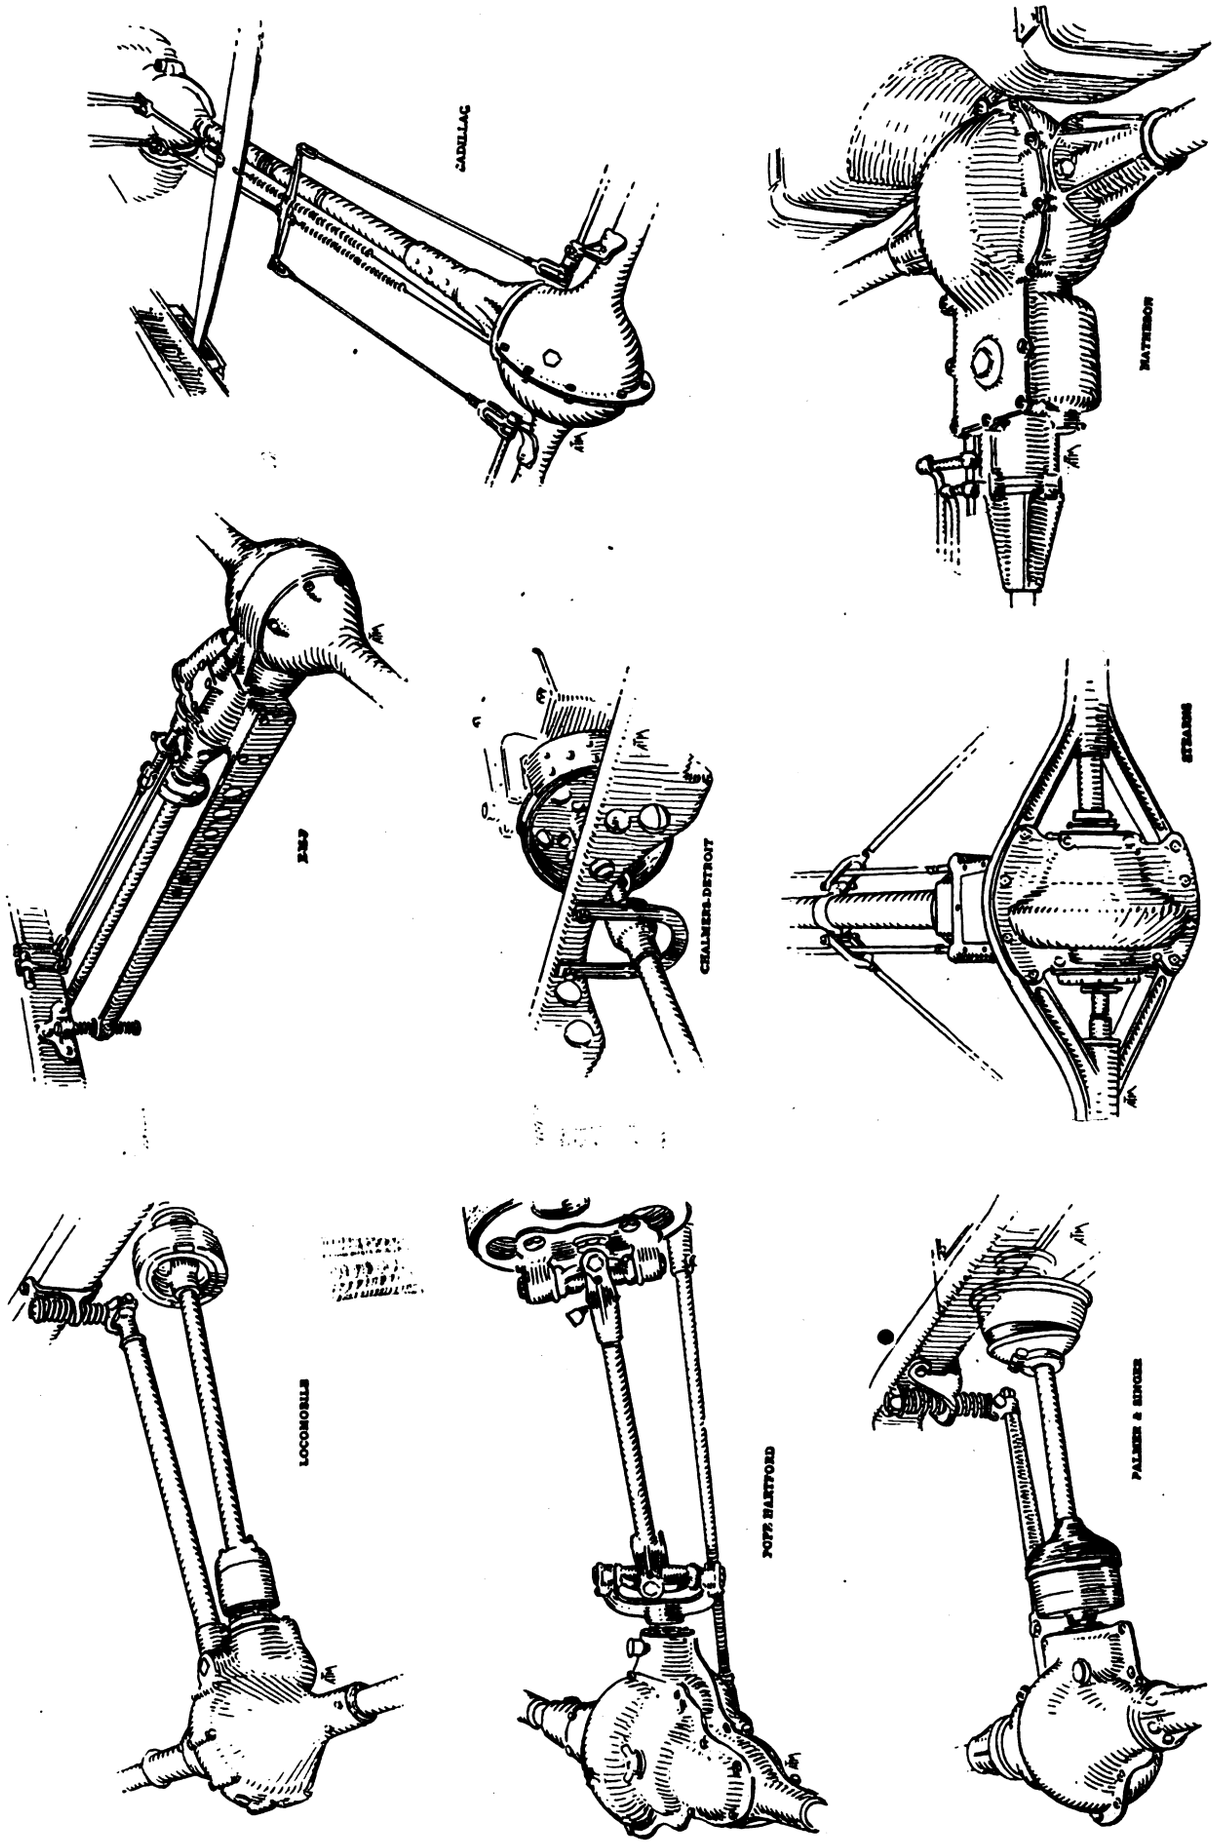
The function of the coils is merely that of cooling and purifying the gas as it leaves the cylinders, so that by the time it reaches the hose connection, which is mounted on the face of the dash, it is at sufficiently low temperature to be introduced into the tires without danger of injury to them. A gauge also mounted on the dash, is useful in determining the line and tire pressures.

It is claimed for the system that the gas delivered to the tires is in no way harmful to the rubber of the tires, being mainly carbon dioxide, with a very small proportion of water, where the engine is running with normal carburation, and that the composition of the vapor is such as to have a preservative influence on the interior of the tubes rather than a deleterious one, such as may occur where the oxydizing influence of pure air is considered. The invention is being produced by the F. A. Law Machine Co., Hartford, Conn.

MAXIM TIRE INFLATOR, SHOWING THE COOLING COIL

Remagnetizing the Ford Magneto.

The possibility of suddenly being called upon to revitalize a de-magnetized magneto always has been one of the big bugbears to the novice in connection with the use of that innocuous and generally trouble-less device. With the ordinary type of high or low tension device, remagnetization may be accomplished only when the magnets are dismounted and treated separately. In the case of the device which has been applied to the new Ford cars, however, and which is of the so-called inductor type no such puzzling undertaking need be gone through.



According to instructions recently issued by the Ford Motor Co., all that is necessary is to remove the transmission cover and turn the engine over, placing a small wire nail, or other steel, over each magnet, as a keeper. Then the magnets should be turned so that two south poles are opposite a north pole of the coils. The polarity is easily determined with a small pocket compass, and the point to observe is that the polarity of the coil must be the opposite of that of the magnets.

Then 5 or 6 cells of storage batteries may be connected in series and one terminal applied to the coil terminal. With the other battery wire or terminal, the circuit should be grounded and broken successively. Thirty to sixty seconds will suffice to remagnetize.

Preservative for Aluminum Surfaces.

For the preservation of the surface of aluminum foot and running boards, this recipe is going the rounds just now: "Brush the surface over well with a weak solution of sulphuric acid, in the proportion of about 5 to 8 parts of water to 1 of acid. This is applied to the surface with a stiff bristle brush, and the surface well rubbed, after which the excess acid is removed with water. Another method sometimes recommended is to make a mixture of turpentine and fine emery, which is applied to the surface with a bristle brush. After vigorous application and rubbing the surface of the metal will be restored.

SOME SUGGESTIVE EXAMPLES OF RECENT PRACTICE IN LIVE AXLE MOUNTING

Digitized by Google

MOUNTING THE LIVE REAR AXLE

Three Classes of Stresses that are to be Neutralized—Some Conspicuous Methods of Solving the Problem.

In order to comprehend thoroughly the problem which the automobile designer must study in laying down the specifications for a car, it is necessary to trace out the several methods of resisting the three sets of stresses or load which the axle and transmission groups must be made to resist successfully. These are in a word, the axle load, or the stresses imposed by the dead weight of the chassis and body upon the springs, which are transmitted to the axle; the traction or driving stresses, which arise from the forward thrust of the axle in the chassis as it transmits the driving effort from the wheels to the ground, and which may be likened to the draw-bar pull of a locomotive; and the torsional stresses, which arise from the reaction caused by the development of power in the engine and from the resistance of bearings and equalizing rods and bars to the tendency of the transmission mechanism to rotate bodily instead of transmitting rotary motion.

Axle stresses are resisted solely by the spring suspension of the vehicle and may be entirely isolated from all others by affording the springs a rotary seating upon the axle tubes and transferring the driving function to other portions of the rear assemblage. A remarkably successful instance of this is found in the new Locomobile "30" chassis, in which by the use of radius rods which are swiveled on the axles in the same manner as the springs, the entire axle is, as it were, left perfectly free to rotate within its mounting, so that its load carrying function is kept entirely apart from any other of its manifold uses.

Traction resistances may be taken up in various ways, the older favorite among many methods being that of the radius rod, which while permitting the axle to retain a certain fixed relation with regard to the chassis and within the limits of the spring shackles, also fixes a point through which the driving thrust of the wheels may be transmitted. Another method is to cause the springs to do the driving, leaving the remainder of the mechanism to perform its part unhampered. Still another method which is in high favor just at present in designs in which the driving shaft is housed by a torque tube, is to take up the driving stresses through the tube itself, transmitting them to the frame through a ball joint which also carries the radial load due to torsional stresses. The rear mounting of the new Stearns chassis is a particularly good example of this, the forward suspension of the torque tube being in a very heavy transverse frame member, to which the outer casing of the ball joint is firmly bolted. The same general practice also is found on the Thomas cars—both the taximeter cab and the new six-cylinder constructions embodying the idea, and in the new Matheson—the first and last named having the unit, or axle mounted gearset.

Torsional stresses, are, perhaps the most difficult for the non-technical observer to appreciate, though they are of a degree of importance which not even the designer has been inclined to overvalue hitherto. The principle of their development may, perhaps best be understood if it be imagined for the moment that the driving shaft of a live rear axle were so fixed that they could not turn. Obviously then, the application of power to the propeller shaft would tend to cause the driving bevel to climb the driven bevel, or, in other words, to rotate around it, carrying the propeller shaft with it.

Commonly the torsional stresses are absorbed by means of a long lever running from the axle housing to a point of support on the frame, concentric with the tube or radius rod supports—or nearly so. To cushion against shock when the power is applied suddenly or when the wheels strike an obstacle in the road, it is necessary to give the bar a yielding support of some sort, which commonly is effected by means of opposed springs which act as shock absorbers.

Where the shaft housing also serves as the torsion resisting member, the shaft itself commonly has but one cardan or universal joint, though a noteworthy exception is found in the case of the latest Thomas chassis. Where the shaft is not housed, it may be equipped with one or two joints according to the method of design.

It will be observed that with the torque tube system no direct provision is made against the effect of such shocks in some cases, as for example in the Chalmers-Detroit and Cadillac cars, the support for the tube being directly on the rear bearing of the gearset. A still more radical method of mounting, however, and one in which both traction and torsion loads are taken up by a single coupling bar, is that of the latest Pope-Hartford, in which this single member is made to do double duty without the intervention of any cushioning support whatever. Ordinarily, however, where the springs are absent, it will be found that a very long leverage is gained for the torsion member, while in cases where such members are very short, as in the case of the Palmer & Singer, ample shock absorption is provided for.

The successful handling of these three sets of stresses form not only one of the greatest complications in live axle design but one of the most puzzling tasks in connection with the layout of the entire machine—the engine details excepted. That so great a variety of practice has been evolved with so little variation in actual result is much to the credit of the engineers who have studied the problem.

DEVELOPING AUTOMOBILE METALS

Haynes Tells of Dealings with Metallurgical Problems—Characteristics of Steel and the Action of Alloys.

That nearly every one of the more thoroughly and better established automobile manufacturers has his own methods of treating the metals which are employed in different parts of his product is a fact which in large measure explains the difference in operation between corresponding parts of different cars. Also, that the development of the metallurgical end of the business of automobile production has had far more to do with the successes in manufacture during the past two or three years than generally is appreciated is a consideration not at all apparent until that development specifically is considered. This subject is reviewed in non-technical synopsis form by Elwood Haynes, pioneer manufacturer and designer, who clearly indicates that the part which the development of metals has played in the development of the automobile is a most important one.

"A few years ago it was considered impossible to build a self-propelled vehicle for the common roads, that could be operated continuously in a practical way because of the very high cost of upkeep," says Mr. Haynes. "A parge part of this excessive maintenance cost was due to the breaking or bending of the various parts of the machine. The early builders of automobiles were not only annoyed almost beyond endurance from this cause, but the problem became so serious that for a time the success or failure of the entire business seemed to hinge upon the possibility of obtaining the materials which would stand the extraordinary stresses imposed by this new means of locomotion.

"Many entertained the idea at first that excessively tough materials would best answer the purpose, and hence employed Swedish iron or very low carbon Bessemer steels. These were found to be absolutely unsuitable in many instances, not because of breakage, but on account of the readiness with which they would bend and take excessive and permanent set, thus throwing the parts out of line and rendering the machine in a short time practically inoperative. Higher carbon Bessemer steels were employed with but little advantage; it is true that they were more elastic, but after a limited amount of use they would deteriorate in strength and finally break in most unexpected places.

"Alloy steels were almost unknown in mechanical construction in the nineties, though nickel steel had been tested to some extent chiefly by firms supplying armor plate steel to the government. However, it was of doubtful utility until introduced into the automobile. The early users of

Digitized by Google

this steel were highly pleased with the extraordinary improvement which it introduced into the machines. First, it proved a great boon in the construction of live rear axles, which when made of ordinary steel had been bending or breaking to an alarming degree. Next, it was tried in crank shafts, which had also given much trouble. Later, it was used for the construction of sliding gear wheels employed in the transmission of the car. Its introduction was not always attended with satisfactory results, but generally speaking the improvement which it made was of a most marked character.

"Unfortunately a number of builders regarded nickel steel simply as an alloy of iron and nickel containing a certain per cent. of the latter metal. They were not particular about the other constituents of the alloy or how the steel was made. This was the cause of a great deal of trouble in the early use of nickel steel. Firms that had never had any experience with alloy steels immediately began making nickel-steel of inferior quality and placing it upon the market. Much of this steel was too high in carbon for the purpose intended, other samples contained considerable quantities of phosphorus and sulphur, thus rendering them unfit for use, while still others were carelessly made up and little if any superior to the ordinary Bessemer product. Gradually, however, it was learned that certain precautions were necessary to make a good nickel-steel, and that the steel must be of such a composition as to answer the requirements necessary in a particular part of the machine.

"A little later chromium was introduced into the nickel-steel, and its effect was found to be vary marked; but while it greatly improved the strength of the nickel-steel, it was found to be very much harder to work, and since it is a triple alloy of iron, chromium, and nickel, besides containing various percentages of carbon, its manufacture and manipulation required much greater care than the making of carbon steel or nickel steel. Moreover, the carbon content must be very carefully controlled or the steel will be greatly modified in its properties and may be rendered utterly unsuitable for the purpose intended. Owing to the great hardness of this steel in its natural or annealed condition, special tools were required for forming and machining it, and even these did not work it rapidly

"Fortunately, at about this time a new alloy tool-steel had been compounded which greatly aided in the working of the nickel-chrome-steel. This new tool-steel is generally speaking, an alloy of iron, tungsten and chromium, containing but a small percent. of carbon. It possesses the extraordinary property of becoming exceedingly hard when heated to whiteness and dipped in oil. The hardness thus imparted to the steel is not readily reduced by heating, and for this reason the tools made of this substance will hold a cutting-edge even though the iron or steel shavings are heated to redness in the process of turning It is questionable whether nickel-chrome-steel could have been successfully introduced into the automobile without the use of this special tool steel alloy.

"Much difficulty was experienced with the nickel-chrome-steel, aside from the difficulty of working it. It is very sensitive to slight differences in temperature employed in tempering it, and to make sure of accurate results a pyrometer must be employed for every operation. Owing to this fact and to the further fact that nickel-steel lends itself to a variety of uses, there has arisen a difference of opinion in regard to which of these materials is more suitable to employ. Many high-class builders use a limited amount of both in the different parts of their machines.

"Closely following the nickel-chrome-steel came the introduction of vanadium steel, or more properly speaking, vanadium-chrome-steel, since vanadium alone is seldom used in automobile steels. The effect of vanadium upon iron and steel has been very carefully studied by Mr. J. Kent-Smith, to whom largely belongs the credit of introducing this valuable material.

"Much has been said and written about the peculiar effect of vanadium upon steel. It is generally conceded now that it acts largely as a scavenger, and exercises a beneficial influence on almost all of the carbon and alloy steels when introduced in minute quantity during the melting process. Its chief office seems to be that of removing the last traces of oxygen and oxides, as well as minute quantities of nitrogen, which latter element exercises a very bad influence on iron and steel even when present in exceedingly small quantity. It is perfectly certain that vanadium exercises a very beneficial effect upon the finished product, giving it closeness and fineness of grain, splendid elasticity, coupled with extraordinary toughness. Fortunately, in addition to these very desirable properties, the steel is sufficiently soft in its annealed state to be turned and machined like ordinary low carbon steel.

"One difficulty in the manipulation of this steel is the persistance with which it resists case hardening. While nickel steel takes up carbon readily at a temperature of from 750 to 800 degrees centigrade, under an exposure of from two to four hours, vanadium steel under the same condition, and in fact in the same annealing box, shows only a slight penetration by carbon after an exposure of from ten to twelve hours. This is probably due to its very dense character. It will, however, take up carbon slowly if exposed to a temperature of 900 degrees Centigrade. But a continuous temperature as high as this exercises a rather marked effect upon the furnace and annealing pots—in fact, in case-hardening this steel I have found it advisable to use graphite pots instead of cast iron ones.

"Besides the steels already mentioned, special grades of openhearth steel may be employed for parts which are not required to resist special stress. And in cases where rigidity rather than high elastic limit is the prime requisite, a good moderately low carbon steel of high purity will answer as well as an alloy steel. As a matter of fact the writer has made a large number of tests which indicate that an openhearth steel of moderate carbon content is stiffer than nickel steel, though not quite so stiff as nickel-chrome-steel or vanadium steel.

"No matter what steel is employed in the construction of an automobile, its full value is only obtained by suitable treatment. For instance, a one-half inch square bar of nickel steel six inches in length supported at both ends, resisted a load of 900 pounds, when it took a permanent set. The same steel after treatment sustained a load of 2,700 pounds before taking the slightest set. A vanadium steel bar under the same condition took a permanent set under a load of about 900 pounds; after treatment it resisted a load of 4,000 pounds without taking the slightest set. In fact, the alloy steel before treatment will frequently show but little more strength than good untreated openhearth steel. The nature of the treatment depends largely upon the use made of the steel, and each manufacturer has a treatment of his own which has been carefully worked out to meet the specific requirements in the various car parts.

'Besides the various drop-forgings, which should never be made of Bessemer steel, high grade crucible steel castings may be employed for certain parts of the machine. For example, a steel of this character is much better for rear-axle housings than malleable iron; in fact, the latter substance, in the opinion of the writer, should have no place in the car excepting for elbows, tees, etc., which are not subjected to engine stress or road stresses.

"The other metals beside iron and steel, employed in the automobile are mainly bronzes of various kinds (including bearing metals, etc.), and aluminum. High grade babbitt metals are now employed to a considerable extent, in the place of bronze, since they have the advantage of never cutting the shaft in case the oil supply should fail. Aluminum castings are employed by nearly all high class builders for crank cases. If properly designed, these castings give excellent results; and at the present price of aluminum, are probably as cheap as any that could be employed for the purpose. It is a notable fact that the Americans were the first to introduce both aluminum and nickel steel into automobile construction, though it is generally supposed that these progressive steps should be credited to the French. The extensive introduction of vanadium steel is also due to Americans."

FORMULATING A UNIFORM LAW

Tentative Draft Submitted to Inter-State Commission for Revision—Full Text of the Proposed Measure

Following close upon the conference of the governors-elect of the New England states which occurred in Boston recently, efforts at securing uniform automobile legislation have been given a more favorable status than ever before through the willing attitude of the Uniform State Law Commissioners of the states of New York, Connecticut, Massachusetts, and New Jersey through whom it is hoped the legislatures of the respective states ultimately may be reached with a uniform measure for the government of the motorist.

At the request of Governor Hughes of New York, Chairman Charles Thaddeus Terry of the New York Board of Commissioners of Uniform State Laws, who also is chairman of the legislative board of the American Automobile Association, called into conference the commissions of the states above named on the 16th inst. in New York City, as has just become known through Chairman Terry's report to the A. A. A. Following a discussion of the subject of motor vehicle law in general, it was requested that the chairman prepare a tentative draft of a uniform law to form a basis of further discussion, suggestion and criticism, preliminary to the adoption by the conference of a bill which the commissioners might recommend to their respective legislatures, if a common ground could be reached.

This has been done, and the tentative draft, which is reprinted in full below, has been forwarded to the commissioners for study and criticism. Its provisions will be discussed at the next meeting of the conference which will occur on Saturday next. 30th inst., at the office of the chairman, 100 Broadway, New York, at 2:30 P M., at which time suggestions from any source relative to the perfection of the measure will be welcomed.

As showing the progress which has been made in the movement for a uniform state law, Chairman Terry points to the embodiment of favorable recommendations in the annual message of Governor Hughes and in the organization of the conference of New England governors-elect which was carried out by Governor Guild, of Massachusetts. In addition to his interest in the subject manifested at that time, Governor Guild also has been forwarded a copy of the proposed enactment, which was placed in the hands of the Massachusetts Highway Commission, and was under consideration by them at the time of framing the bill which is at present before the legislature of that state.

A probable extension of the present movement was forecasted in a motion introduced into the Senate of Pennsylvania on the 19thinst., asking Governor Stuart to invite the Governors of New York, New Jersey, Delaware, Maryland, West Virginia and Ohio to co-operate with Pennsylvania for a convention to adopt a uniform state motor vehicle law in the states bordering upon Pennsylvania. The resolution, which was referred to a committee, authorizes Governor Stuart to appoint five delegates to the convention.

The tentative draft of the uniform state law bill prepared by Chairman Terry is, in all important respects, a duplicate of the uniform automobile bill which he prepared a year ago. Among its more important provisions are: That if the statutes of the resident state have been complied with, no additional fees will be demanded of visiting motorists by other states; that annual registration shall be indicated by the use of number plates of different colors for succeeding years; that fees shall be graduated according to the horsepower of vehicles, from a minimum of $3, to a maximum of $70, with a $10 blanket license fee for manufacturers and agents. Speed restrictions are abandoned, the speed clause in standing laws being replaced by a restriction similar to that imposed by the Connecticut law, while the penalties for speed violations are given a maximum of $250 fine for the first offense and a $500 maximum with the alternative of six months imprisonment, or both for the second and subsequent offenses. Chauffeurs' licenses are to cost $5 a year, with a $50 penalty for violation of the requirements. For the use of cars without the permission of their owners a fine of $500 or imprisonment for not more than six months, or both, is provided. The full text ofthe bill is as follows:

Section 1. Definitions.

The term "motor vehicle" as used in this act, except where otherwise expressly provided, shall include all vehicles propelled by any power other than muscular power, except motor bicycles, motorcycles, traction engines, road rollers, fire wagons, engines, police patrol wagons, ambulances and such vehicles as run only upon rails or tracks. The term "local authorities" shall include all officers of counties, cities, boroughs, towns or villages, as well as all boards, committees and other public officials of such counties, cities, boroughs, towns or villages. The terms "chauffeur" shall mean any person operating a motor vehicle for hire, or as the employee of the owner thereof. The term "state" as used in this act, except where otherwise expressly provided, shall also include the territories and the federal districts of the United States. The term "owner" shall also include any person, firm, association or corporation renting a motor vehicle or having the exclusive use thereof, under a lease or otherwise, for a period greater than thirty days. The term "public highway" shall include any highway, county road, state road, public street, avenue, alley, park, parkway or public place in any county, city, borough, town or village, except any speedway which may have been or may be expressly set apart by law for the exclusive use of horses and light carriages.

Section 2. Registration of Motor Vehicles.

1. Every owner of a motor vehicle which shall be operated or driven upon the public highways of this State, shall, for each motor vehicle owned, except as herein otherwise expressly provided, cause to be filed, by mail or otherwise, in the office of the Secretary of State a verified application for registration on a blank to be furnished by the Secretary of State for that purpose, containing: (1) A brief description of the motor vehicle to be registered, including the name of the manufacturer, the style, type and factory number of such vehicle, the character of the motor power and the amount of such motor power stated in figures of horsepower. (2) The name, residence and business address of the owner of such motor vehicle and the name of the county in which he resides; provided that if such motor vehicle is used or to be used solely for commercial purposes, or, if propelled by electric battery power, is used or to be used solely within the confines of a city, the applicant shall so certify.

2. Upon the receipt of an application for registration of a motor vehicle or vehicles as provided in this section and in seceion four of this act, the Secretary of State shall file such application in his office and register such motor vehicle or vehicles with the name, residence and business address of the owner, manufacturer or dealer as the case may be, together with the facts stated in such application, in a book or index to be kept for the purpose, under the distinctive number assigned to such motor vehicle by the Secretary of State, which book or index shall be open to inspection during reasonable business hours.

3. Upon the filing of such application and the payment of the fee provided in subdivision six of this section, the Secretary of State shall assign to such motor vehicle a distinctive number, and, without expense to the applicant, issue and deliver to the owner a certificate of registration, in duplicate, in the form and size provided in subdivision three of section three hereof. In the event of the loss, mutilation or destruction of a certificate of registration, the owner of a registered motor vehicle may obtain from the Secretary of State a duplicate thereof, upon filing in the office of the Secretary of State an affidavit showing the fact and the payment of a fee of one dollar for each duplicate.

4. The Secretary of State shall, within sixty days after this act takes effect, and thereafter, on or before the first day of February of each year, furnish to the clerk of every county in the State a full and accurate list of all motor vehicles so registered, stating the distinctive numbers so assigned to them and the names, residences and business addresses of the owners, manufacturers or dealers, as the case may be, and once each month thereafter a similar list of the additional registrations, which additional list shall be entered by each county clerk upon the original list received by him. Such lists shall be filed by such county clerks and be kept as public records, open to inspection during reasonable business hours.

5. Such registration shall be renewed annually in the same manner and upon the payment of the same fee as provided in this Section for original registration. Such renewal to take effect on the first day of January of each year.

6. The following fees shall be paid to the Secretary of State upon the registration of a motor vehicle in accordance with the provisions of this Act: Three dollars upon the registration of a motor vehicle having a rating of less than twenty horsepower. Five dollars upon the registration of a motor vehicle having a rating of twenty horsepower, and less than thirty horsepower; and Ten dollars upon the registration of a motor vehicle having a rating of thirty horsepower or more; and if a motor vehicle has two ratings of horsepower, the registration fee shall be based on the higher rating; provided that the owner of any motor vehicle which has been registered under existing law subsequent to the —— day of —— one thousand nine hundred and —— shall be entitled to a credit or rebate of the fees paid under such law for such registration; and provided further that for motor vehicles which in the verified application for registration are stated to be used solely for commercial purposes, or, if propelled by electric battery power, to be used solely within the confines of a city, the fee for such registration shall be five dollars.

7. Upon the sale of a motor vehicle registered in accordance with this section, the vendee shall, within ten days after the date of such sale, notify the Secretary of State of the same upon a blank furnished by him for that purpose, stating the name and business address of the previous owner, if known, the number under which such motor vehicle is registered and the name, residence and business address of such vendee. Upon filing such statement such vendee shall pay to the Secretary of State a fee of one dollar, and upon receipt of such statement and fee the Secretary of State shall file such statement in his office and note upon the registration book or index such change in ownership, and at least monthly notify every county clerk of the State of such sales, each of whom shall immediately note the same on the list of registered vehicles received and kpt on file by him as herein provided.

8. The registration fees imposed by this act upon motor vehicles other than those of manufacturers and dealers and those used solely for commercial purposes, shall be in lieu of all other taxes, general or local, to which motor vehicles may be subjected as personal property under the laws of this State.

Section 3. Distinctive Number Must be Carried on Motor Vehicles.

1. No person shall operate or drive a motor vehicle on the public highways of this State after the —— day of —— nineteen hundred and ——, unless such vehicle shall have the certificates of registration assigned to it by the Secretary of State conspicuously displayed, one on the front and one on the rear of such vehicle, each securely fastened so as to prevent the same from swinging, provided that the owners of motor vehicles registered and assigned numbers under any law in force at the time this act takes effect, shall continue to display such numbers thereon until the —— day of —— nineteen hundred and ——. No person shall display on such vehicle at the same time any number assigned to it under any other motor vehicle law or ordinance.

2. Such certificates of registration shall be of a distinctly different color or shade each year, to be designated and selected by the Secretary of State,

Digitized by Google

and there shall be at all times a marked contrast between the color of the number plates and that of the numerals or letters thereon.

3. Such certificates of registration shall be an enamelled plate or placard of metal, four and one-half inches wide and not more than twelve inches in length, in the upper left hand corner of which there shall be a fac-simile of the seal of the State, underneath which there shall be the intitials "——" and to the right of which seal and initials there shall be the distinctive number assigned to the vehicle set forth in numerals three inches long, each stroke of which shall be at least one half an inch in width; provided that in the case of a motor vehicle registered under section four of this act there shall be on such plate or placard in addition to the foregoing the letter "M," the same to be at the right of the distinctive number, each stroke of such letter to be at least three inches long and one-half an inch in width.

Section 4. Registration by Manufacturers and Dealers.

1. Every person, firm, association or corporation manufacturing or dealing in motor vehicles may, instead of registering each motor vehicle so manufactured or dealt in, make a verified application upon a blank to be furnished by the Secretary of State for a general distinctive number for all the motor vehicles owned or controlled by such manufacturer or dealer, such application to contain: (1) a brief description of each style or type of motor vehicle manufactured or dealt in by such manufacturer or dealer, including the character of the motor power, the amount of such motor power stated in figures of horsepower, and the weight in pounds of each such style or type; and (2) the name, residence and business address of such manufacturer or dealer. On the payment of a registration fee of ten dollars, such application shall be filed and registered in the office of the Secretary of State in the manner provided in section two of this act. There shall thereupon be assigned and issued to such manufacturer or dealer a general distinctive number and duplicate certificates of registration in the manner provided by section two, which shall be in the form of plates as provided in section three, duplicates of which shall be carried or displayed by every motor vehicle of such manufacturer or dealer, so registered when the same is driven or operated on the public highways. Such manufacturer or dealer may obtain as many duplicates of such certificates of registration as may be desired upon payment to the Secretary of State of one dollar for each duplicate. Nothing in this subdivision shall be construed to apply to a motor vehicle operated by a manufacturer or dealer for private use or for hire.

2. Such registration shall be renewed annually in the same manner upon the payment of a fee of Ten Dollars, such renewal to take effect on the first day of January of each year.

Section 5. Exemption of Non-resident Owners.

The provision of the foregoing sections shall not apply to a motor vehicle owned by a non-resident of this State, provided that the owner thereof shall have complied with the provisions of the law of the State of his residence relative to motor vehicles and the operation thereof and shall conspicuously display his State number, and provided further that the provisions of the foregoing sections of this act are substantially in force in such State; provided that this exemption shall not apply to non-resident corporations doing business in this State.

Section 6. Brakes, Horns, Lamps, etc.

1. Every motor vehicle, operated and driven upon the public highways of this State, shall be provided with adequate brakes sufficient to control the vehicle at all times, and a suitable and adequate bell, horn or other device for signalling, and shall, during the period from one hour after sunset to one hour before sunrise, display at least two lighted lamps on the front and one on the rear of such vehicle, which shall also display a red light visible from the rear. The white rays of such rear lamp shall shine upon the number plate carried on the rear of such vehicle. The light of the front lamps shall be visible at least two hundred feet in the direction in which the motor vehicle is proceeding.

2. No person shall operate or drive on the public highways of this State a motor vehicle on any of whose wheels is a tire chain or non-skidding contrivance or tire composed in whole or in part of metal, except when such highways are wet and slippery or covered with ice or snow.

3. A person operating a motor vehicle shall, at request or on signal by putting up the hand, from a person riding, leading or driving a horse or horses or other draft animals, bring such motor vehicle immediately to a stop, and, if traveling in the opposite direction, remain stationary, so long as may be reasonable to allow such horse or animal to pass, and, if traveling in the same direction, use reasonable caution in thereafter passing such horse or animal; provided that, in case such horse or animal appears badly frightened or the person operating such motor vehicle is requested so to do, such person shall cause the motor of such vehicle to cease running so long as shall be reasonably necessary to prevent accident and insure the safety of others.

Section 7. Speed Permitted.

No person shall operate a motor vehicle upon the public highways of this State recklessly or at a rate of speed greater than is reasonable and proper having regard to the width, traffic and use of the highway, or so as to endanger property, or the life or limb of any person.

Section 8.—Registration of Chauffeurs.

1. Every person hereafter desiring to operate a motor vehicle as a chauffeur shall file in the office of the Secretary of State, upon the payment of a registration fee of five dollars, a verified application for registration on a blank to be furnished by the Secretary of State for that purpose containing (1) the name and residence address of the applicant and that he is competent to operate a motor vehicle and is over 18 years of age; (2) the trade name and motor power of the motor vehicle or vehicles he is competent to operate; (3) whether or not the applicant has been previously convicted of a violation of any of the provisions of this or any other motor vehicle law or ordinance, giving the date and place of such conviction and the provision or provisions of the law or ordinance violated; provided that if such chauffeur shall intend to operate only vehicles used solely for commercial purposes, he shall so certify in such application and shall pay a registration fee of two dollars.

2. Upon the receipt of such an application, the Secretary of State shall thereupon file the same in his office, assign the applicant a number and register him in a book or index which shall be kept in the same manner as the book or index for the registration of motor vehicles. The Secretary of State shall also furnish to the clerk of every county of the State within sixty days after this act takes effect and once each month thereafter, a full and accurate list of chauffeurs so registered, with their addresses and the numbers assigned to each, in the same manner as provided in section two with reference to registered motor vehicles. Such lists shall be filed by such county clerks and be kept as public records, open to inspection during reasonable business hours.

3. The Secretary of State shall forthwith upon registering such chauffeur, and without other fee, issue and deliver to him a badge of aluminum or other suitable metal, which shall be oval in form with its greater diameter not more than two inches, upon which shall be stamped the words "Registered Chauffeur Number ——; State of ——" with the number inserted therein. This badge shall thereafter be worn by such chauffeur, pinned upon his clothing in a conspicuous place, at all times while he is operating a motor vehicle upon the public highways of this State. In the event of the loss, mutilation or destruction of a chauffeur's badge, such chauffeur may obtain from the Secretary of State a duplicate thereof upon filing in the office of the Secretary of State an affidavit showing the fact and the payment of a fee of one dollar.

4. No chauffeur, having registered as hereinbefore provided, shall voluntarily permit any other person to wear his badge; nor shall any person, while operating a motor vehicle upon the public highways of this State, wear a chauffeur's badge belonging to another person, or a fictitious chauffeur's badge.

5. No person shall operate or drive a motor vehicle as a chauffeur, upon the public highways of this State after thirty days after this act takes effect, unless such person shall have complied in all respects with the requirement of this section, provided, however, that a non-resident chauffeur, who has registered under the provisions of the law of the State of his residence which are substantially similar to the provisions of this section, shall be exempt from registration under this section; and provided further he shall wear the badge assigned to him in the State of his residence in the manner provided in subdivision three of this section.

Section 9.—Local Ordinances Prohibited.

Except as herein otherwise provided, local authorities shall have no power to pass, enforce or maintain any ordinance, rule or regulation requiring from any owner or chauffeur to whom this act is applicable, any tax, license or permit for the use of the public highways, or excluding any such owner or chauffeur from the free use of such public highways, or in any other way respecting motor vehicles or their speed upon or use of the public highways; and no ordinance, rule or regulation contrary to the provisions of this act, now in force or hereafter enacted, shall have any effect; provided, however, that the powers given to local authorities to regulate vehicles offered to the public for hire, and processions, assemblages, or parades in the streets or public places, and all ordinances, rules and regulations which may have been, or which may be enacted in pursuance of such powers shall remain in full force and effect; and, provided, further, that local authorities may set aside for a given time a specified public highway for speed contests or races, to be conducted under proper restrictions for the safety of the public, and provided further, that local authorities may exclude motor vehicles from any cemetery or grounds used for the burial of the dead.

Section 10.—Penalty for Violations of Sections Two, Three, Four, Five and Six.

1. The violation of any of the provisions of sections two, three, four, five and six of this act shall be punishable by a fine not exceeding fifty dollars.

2. The violation of any of the provisions of sevtion seven of this act shall be deemed a misdemeanor punishable by a fine not exceeding two hundred and fifty dollars for a first offense and by a fine not exceeding five hundred dollars or imprisonment for not more than six months or both for a second or subsequent offense; but nothing herein shall prevent the indictment of a person so violating under any other law.

3. The violation of any of the provisions of section eight of this act shall be punishable by a fine not exceeding fifty dollars or the suspension of the right to operate a motor vehicle as a registered chauffeur under the provisions of this act for a period not more than six months.

4. Any person using, operating, driving or tampering with a motor vehicle without the permission of the owner of such motor vehicle is guilty of a misdemeanor punishable by a fine not exceeding five hundred dollars and imprisonment for not more than six months, or both.

5. Upon the conviction of any person for a violation of any of the provisions of this act, the magistrate or other judicial officer before whom the proceedings are held, shall immediately certify the facts of the case, including the name and address of the offender, the character of the punishment and the amount of any fine imposed and paid, to the Secretary of State, who shall enter the same either in the book or index of registered motor vehicles or in the book or index of registered chauffeurs as the case may be, opposite the name of the person so convicted, and in the case of any other person, in a book or index of offenders to be kept for such purpose, in alphabetical order. The Secretary of State shall send notices of all convictions for violations of section seven of this act, with the names and addresses of the persons convicted and the judgments of the court on such convictions, to the clerk of every county in the State, who shall enter the same on the lists of registered motor vehicles or registered chauffeurs as the case may be, opposite the name of the person so convicted, or on a list of other offenders which he shall maintain in his office as a public record in the same manner as the lists of registered motor vehicles and registered chauffeurs, and on due application furnish copies of such lists to the magistrates or other judicial officers of his county before whom violations of the provisions of this act are triable. If any such convictions shall be reversed upon appeal therefrom, the person whose conviction has been so reversed may serve on the Secretary of State a certified copy of the order of reversal, whereupon the Secretary of State shall enter the same in the proper book or index in connection with the record of such conviction, and shall also notify each county clerk of the same.

6. In case any person shall be taken into custody because of a violation of any of the provisions of this act, he shall forthwith be taken before the nearest magistrate or justice of the peace in any city, village or county, or before any acessible captain, sergeant of police or acting captain or sergeant of police who shall have the powers of a magistrate or justice of the peace, and be entitled to an immediate hearing; and if such hearing cannot then be had, be released from custody on giving a bond or undertaking executed by a fidelity or surety company authorized to do business in this State, such bond or undertaking to be in an amount not exceeding two hundred and fifty dollars for his appearance to answer for such violation at such time and place as shall then be indicated, or on giving his personal undertaking to appear to answer for such violation at such time and place as shell then be indicated, secured by the deposit of a sum not exceeding two hundred and fifty dollars, or in lieu thereof, in case the person taken into custody is the owner, by leaving the motor vehicle, or in case such person taken into custody is not the owner, by leaving the motor vehicle with a written consent given at the time by the owner, who must be present, with such judicial officer; or in case such judicial officer is not accessible be forthwith released from custody on giving his name and address to the person making the arrest and depositing with such arresting officer the sum of two rundred and fifty dollars, or in lieu thereof, in case the person taken into custody is the owner, by leaving the motor vehicle, or in case such person taken into custody is not the owner, by leaving the motor vehicle with a written consent given at the time, by the owner, who must be present; provided that, in such case, the officer making the arrest shall give a receipt in writing for such sum or vehicle deposited, and notify such person to appear before the most accessible magistrate, naming him, and specifying the place and the hour. In case such bond or undertaking, shall not be given, or deposit made by an owner, or other person taken into custody, the provisions of law in reference to bail in cases of misdemeanor shall apply.

7. In case the magistrate before whom any person shall be taken, charged with the violation of any provision of this act, shall not have jurisdiction to try the defendant, but shall hold the defendant to answer as provided by —— of the —— shall admit such defendant to bail upon his giving a surety company's bond or undertaking to appear to answer for such violation at such time and place as shall be indicated, or upon his giving his written undertanking in the form provided in —— in a sum equal to the maximum fine for the offense with which he is charged, or upon depositing such amount in cash with such magistrate who shall give a receipt in writing for such sum.

8. Upon the person who has been taken into custody and given security or bail for his appearance presenting himself for trial, the judicial officer before whom such person is to be tried, shall, before the beginning of such trial, return to the person about to be tried, the property or money given as security or bail.

Section 11.—Registration Fees to be Paid into State Treasury.

1. The registration fees provided herein shall be paid by the Secretary of State into the State treasury. The legislature shall annually make appropriations of an amount sufficient to pay all proper expenses of this act.

Digitized by Google

2. All fines, penalties or forfeitures imposed or collected for a violation of any of the provisions of this Act, or of any act in relation to the use of the public highways by motor vehicles now in force or hereafter passed, which are imposed or collected under the sentence or judgment of a court of special sessions, held or presided over by a justice of the peace, shall be paid over by such justice of the peace within ten days after receipt thereof to the treasurer of the State, with a statement accompanying the same, setting forth the action or proceeding in which such moneys were collected, the name and residence of the defendant, the nature of the offense and the fine, penalty or sentence imposed. On the first day of each month, or within ten days thereafter, such justice of the peace shall make and forward to the treasurer of the State, a verified report of all criminal proceedings instituted or tried before him during the preceeding calendar month for violations of any of the provisions of this act, or of any act in relation to the use of the public highways by motor vehicles, which report shall set forth the name and address of the defendants, the nature of the offenses and the fines and penalties collected or imposed by such justice; which reports shall be public records and open to inspection during reasonable business hours.

3. All moneys paid into the State treasury pursuant to this act, except such as shall be appropriated under subdivision one of this section, shall there be maintained as a separate fund for the maintenance and repair of the irpmoved roads of this State, outside of corporate limits of towns and cities.

Section 12—Acts Repealed.

All acts or parts of acts inconsistent herewith or contrary hereto, are hereby expressly repealed.

Section 13.—Title of Act and When It Takes Effect.

This act shall be known as the "Motor Vehicle Law," and shall take effect the first day of —— nineteen hundred and ——; provided that applications for registration may be made and registration certificates and badges issued at any time within thirty days prior to such date.

Surface Schemes for New Orleans.

Three bidders are in hot competition for the contract to prepare the race track at the New Orleans fair grounds for the automobile speed contests of Mardi Gras week, February 20, 21 and 22. The recent arrival of a representative of a concern manufacturing a dust-laying and surface-packing preparation made from the refuse of a glucose factory, and the attendant publicity given his mission of securing the contract for transforming the dirt course into a cement-like oval, aroused two Louisiana concerns which claim to have a superior product. One of these is an oil well syndicate operating near Jennings, La. The other is a wealthy Louisiana planter who has several hundred barrels of the coarse grade molasses in storage. The planter had discovered the surface-packing properties of molasses by accident, a barrel having burst and the contents spilled on the road. It was soon noticed that for several square yards the roadway was like a cement floor, but no attention was paid to the commercial possibilities of crude molasses, which is very cheap and sometimes unusable as a food product. Reading the stories of the necessity for a preparation to harden the fair grounds track for the automobile races, the planter offered to furnish 500 barrels of molasses free to demonstrate the practicabil- practice might be suppressed.

Proposes Rogues' Gallery for Scorchers.

Captain O'Brien of the Chicago City Detective Bureau has become enthused with the project of establishing a special department of the rogues' gallery for the portraits of scorching motorists. By preserving the records of all difficulties into which habitual scorchers are plunged, he thinks the practice might be suppressed.

CONGRESS TO REGULATE MOTORING

Bill Introduced Imposes no Speed Limit, but Requires Registration—Applies Only to Federal District.

Abolition of the speed limit and provision that motorists shall drive with due regard to life, limb and property" is one of the more significant clauses in the automobile bill which was introduced into the House of Representatives at Washington yesterday (Wednesday) by Representative Olcott, of New York. The bill is intended to regulate the operation of motor vehicles in the District of Columbia and the territories, and is not particularly radical in other respects.

The measure requires owners of machines to register them at the office of the Secretary of Commerce and Labor, a filing fee of $2 for each machine to be charged Owners of a number of machines may take out a series of licenses, the first to cost $2 and the others 50 cents each. It is specifically provided that the law shall in no way interfere with the right of one injured by an automobile to sue to recover damages. There is a provision requiring automobiles to be equipped with a brake and with a bell, horn or other device to attract the attention of pedestrians and drivers.

Between the hours of sundown and sunrise all machines shall carry two white lanterns, which shall be kept lighted during that period. In case of accident a machine will be required to stop in order that persons injured may secure the registered number. In approaching traffic it is required that chauffeurs shall give due notice of approach, and in passing a fractious horse or any animal that appears to be nervous the operator of the machine is required to slow down and on a signal from the driver shall stop entirely. Violations of the law requiring machines to register may be punishable by a fine of $100 or thirty days in jail. For violation of any other provision of the bill a fine of $50 or ten days in jail may be imposed.

Test Case Under New Jersey's Law.

The constitutionality of the Frelinghuysen automobile law of New Jersey, insofar as it relates to the exaction of a fee for the registration of motor vehicles, is to be tested in the Supreme Court of that State. Supreme Court Justice Reed on Monday, 25th inst., upon the application of Peter Backes, granted a writ of certiorari in the case of Richard Johnson, of the White Steamer Co., who was arrested in Trenton last May by Captain Cleary of the local police force for running an automobile without a license. He was fined $100 in the police court, and the fine was subsequently affirmed by Judge Rellstab in the Mercer county court.

In the meantime an unsuccessful effort was made to get the case before the United States courts upon habeas corpus proceedings. These, however, failed because it was shown that Johnson was not in actual custody, having been released and allowed to return to New York immediately after his arrest.

Mr. Backes contended that the Frelinghuysen act is unconstitutional because it abridges the guaranteed liberty of the individual. He argued that it is not in its essence a license act, but is really a tax measure, and therefore, under the Constitution, the tax must be levied according to uniform laws. In support of this contention he showed that in 1906 the revenue derived from licensing automobiles was $5,480; in 1907 it was $82,685, and in 1908, $149,288. The expenses of maintaining the department in 1907 were $13 372, and in 1908, $29,367. Assuming that the license is required as a tax, Mr. Backes argued that it is not levied on the basis of the value of cars, but upon their horsepower, which is no indication of their value.

Mr. Backes argued that there was a further unjust discrimination against the automobile, which is required to pay taxes not assessed against other users of the public highway. He also raised the question that the Frelinghuysen act is in violation of the interstate commerce law. In connection with this, one of the contentions made by Johnson was that when arrested he was taking tools from the New York office to the Philadelphia office of the White Steamer Co.

It is expected that arguments on the writ of certiorari will be heard at the February term of the Supreme Court.

Protests Against Sport on New Road.

Frequently when a new road is constructed, especially one on a stiff hill, local motorists and automobile dealers flock to the course to try their cars on it, with the result that the road surface is soon torn up and put in bad condition. At least, such is said to be the result of the practice, and among those who hold that view is Contractor William Fogarty, of Cincinnati, who constructs roads in that city, and has filed a protest with the Board of Public Service recently, in which he complains of the results of this practice. In his complaint he says:

"I wish to respectfully call your attention to the practice of automobile companies of testing the hill-climbing power of their machines on Sycamore avenue. This avenue has just been completed and accepted by the city, and inasmuch as I am under contract to maintain the roadway I wish to protest against this practice. Ordinary traffic, I am satisfied, will not damage the avenue; but if it is used as a testing track I decline to be responsible for the consequences."

The matter was turned over to the City Engineer for report.

REGISTRATION FOR ALL VEHICLES

One of Several New Propositions Before the Massachusetts Legislature—Bill to Create a Highway Police.

Four bills of interest to motorists are before the Massachusetts legislature and their passage is urged by the Automobile Owners Association through its counsel, Francis Hurtubis, Jr. One of them provides for the registration of all horse drawn vehicles, carriages, wagons, carts, sleighs and sleds on a plan similar to that applying to motor vehicles. Another provides for a number of highway police to be appointed by the State highway commission. A third takes away from towns and cities the right to exclude motor vehicles whose owners have complied with the laws, unless such towns or cities act with the approval of the highway commission. The fourth bill makes it a criminal offense to tamper with motor vehicles or to steal rides thereon. In connection with these bills Mr. Hurtubis is filing for the Federation of American Motorcyclists a bill providing that motorcycles shall be classified and registered apart from automobiles and other vehicles, and that they be given a separate code of their own and different licenses.

The main provisions of the bill for registering horse-drawn vehicles include registration by the highway commission, as in the case of automobiles, and the issuance of car numbers to be conspicuously displayed. It gives free use of the highways by non-residents for a period of ten days. Money derived from registration fees is to be divided in the ratio of 60 per cent. to the Commonwealth and 40 per cent. to the cities and towns in which vehicles are registered, the money to be used in the maintenance or construction of highways. The bill requires that every vehicle that is out after sunset shall display at least one light.

Under the provisions of the bill providing for highway police, such officers will possess all the powers of constables, except the service of civil process, and of police officers and watchmen, and may serve all processes lawfully issued by the highway commission. Each is to be provided with a motorcycle and his duty will be to prevent "reckless or dangerous driving of motor and other vehicles upon the highways" and generally to enforce "all laws relative to motor and other vehicles." The bill provides that "cities and towns shall have no power to establish or maintain 'traps' so-called, except in such places as may meet with the approval of the Massachusetts highway commission."

Yet another bill has been added to the mass of automobile legislation the State Solons are called upon to digest, and it will afford satisfaction only to lovers of noise. It was filed on Saturday, 23d inst., by Representative Waugh, of Somerville, and is entitled "An act to compel automobilists to give continuous warning of their approach." The measure seeks to force automobilists to place upon their machines a sound contrivance, not specified, which shall keep going continuously, but which will make no more noise than a sleigh bell.

Wants $5,000 for Involuntary Jump.

On November 13 last, W. F. English, M. D., of Saginaw, Mich., jumped with his automobile from a bridge into the river and now wants that city to pay him $5,000 for doing the trick. While it might appear at first that Dr. English is a high-priced performer in view of the fact that no high-dive artist ever receives that amount for one single performance, the doctor claims that Saginaw owes him that sum as legitimate damages. In an itemized statement, after asserting that the damage was caused owing to the negligence of the city in allowing a bridge to stand in such a condition that it was dangerous for a motor car to approach at even a most moderate speed, the doctor lists the following items:

"Injury to automobile, $800; loss of watch, $35; paid to remove auto from river, $17; paid to repair overcoat and clothing, $11." In concluding he remarks, "affiant further says that on account of said injuries aforesaid he was unable to perform any part of his business for one month, amounting to a loss of the sum of $500; that he was compelled to pay the expense of treatment at Mt. Clemens, amounting to $50, for all of which he intends to hold the said city liable."

Speare Recalled to Bay State Presidency.
